The neutral density studies described in this report concentrate on specifying tidal aspects of the thermosphere. Firstly, HME's were used to describe the variations in a database of tidal measurements providing improved thermospheric specification. Similar techniques were used to derive diurnal and semi-diurnal density corrections to the Grove/MSIS83 model currently used by the AWS. Finally, the variations of satellite-based (SETA) wind and density measurements in the 170-220 km high latitude region have been described. The plasma modeling work described in this report includes both the development and application of semi-empirical ionospheric models and the application of theoretical models. A simple model was derived for storm-time middle-latitude perturbation in TEC. A simple model of slab thickness was developed leading to a simple successful model of TEC. Slab thickness was also used as a constraint in a new profile formalism that was both validated against an ICS database and extended into a SLIM-like profile model. The PLIM was applied in diagnostic modeling studies to investigate the nature of diurnal double maxima and to derive relationships between ionospheric parameters and satellite-based UV nightglow measurements providing additional ionospheric monitoring at AWS. NUMERICAL PROCEDURE FOR PLANETARY WAVE SOLUTION

Woo Kap Choi and D. J. Wuebbles Sep. 1993 12 p
(Contract W-7405-eng-48)
(DE94-004280; UCRL-ID-115335) Avail: CASI HC A03/MF A01

The newly-developed LLNL two-dimensional chemical-radiative-transport model requires a knowledge of the EP flux divergence as an input momentum forcing. The major contributions for this forcing term come from the synoptic wave in the troposphere, the planetary wave in the stratosphere and mesosphere and the gravity wave in the upper mesosphere. The major source of the zonal momentum forcing in the middle atmosphere is the nonlinear planetary wave breaking. This planetary wave breaking also plays a significant role of mixing the chemical tracers. Garcia suggested a way of parameterizing the planetary wave breaking by using linear damping of the primary wave. In this note we describe the procedure of obtaining the wave solution for the parameterization. DOE

INVESTIGATION OF PLASMA INSTABILITIES IN THE POLAR CUSP Annual Progress Report, 1 Sep. 1993 - 28 Feb. 1994

H. K. Wong 1994 10 p
(Grant NAGw-1620; SwRI Proj. 15-2779)
(NASA-CR-195212; NAS 1.26:195212) Avail: CASI HC A02/MF A01

During the last six months, considerable progress was made in studying the excitation of electromagnetic waves in the whistler frequency range by an anisotropic or gyrating electron beam. A paper entitled 'Electron Cyclotron Wave Generation by Relativistic Electrons' was published in the Journal of Geophysical Research. Another paper entitled 'Electron Beam Excitation of Upstream Waves in the Whistler Mode Frequency Range' was submitted for publication in Journal of Geophysical Research. This paper is in collaboration with Dr. C. W. Smith at Bartol Research Institute. In this paper, it was shown that an anisotropic electron beam (or gyrating electron beam) is capable of generating both left-hand and right-hand polarized electromagnetic waves in the whistler frequency range. Our earlier paper 'Electromagnetic Components of Auroral Hiss and Lower Hybrid Waves in the Polar Magnetosphere' was accepted for publication in the AGU Chapman Conference on Micro and Meso Scale Phenomena in Space Plasmas. Electromagnetic waves in the lower hybrid and whistler waves regime were identified and a mechanism of how these waves are generated was suggested. Author (revised)

A PRELIMINARY SHEAR VELOCITY MODEL FOR CENTRAL ASIA Final Report, Jan. - 31 Dec. 1993

Alet Zielhuis and Brian L. Kennett 24 Dec. 1993 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0352-90)
(AD-A274972; AFOSR-94-0003TR) Avail: CASI HC A02

Waveforms of S body waves and Rayleigh waves are analyzed with the method of partitioned waveform inversion, with the objective to develop a three dimensional S-velocity model for the crust and upper mantle below Central Asia. Thus far, 103 seismograms have been processed. Using starting models with crustal thicknesses representative for the source-receiver path, good predictions of the observed waveforms, and good fits, have been obtained. The preliminary model, constructed on the basis of the data collected, shows that the Indian craton is marked by distinctly higher velocities than the rest of the region between 45 and at least 100 km depth. The Tarim craton and the Sino-Korean craton do not show high velocities at this depth. The Tibetan Plateau shows low velocities between 70 and 200 km depth. DTIC

RECENT ASCOT EXPERIMENTS IN MULTI-LAYERED FLOWS

C. E. Elderkin Sep. 1993 5 p Presented at the Topical Meeting on Environmental Transport and Dosimetry, Charleston, SC, 31 Aug. - 3 Sep. 1993
(Contract DE-AC06-76RL-01830)
(DE94-002360; PNL-SA-22598; CONF-930810-11) Avail: CASI HC A01/MF A01

The US Department of Energy's (DOE's) Atmospheric Studies in Complex Terrain (ASCOT) program has conducted its most recent research along the mountain-plains interface near DOE's Rocky Flats Plant in Colorado. ASCOT meteorological experiments in January and February 1991 were coordinated with Rocky Flats tracer releases for airflow and dispersion evaluations. It was found that dispersion was controlled by multiple scales of motion that created interacting layers of flow varying significantly in three dimensions and on an hourly basis. Plume dispersion at night was held close to the surface within a stable drainage-layer that followed regional flow features, intermittently interrupted by evolving mountain-canyon flows. Further implications of the highly variable flow features are that releases into shear zones above shallow surface layers or into canyon outflows, undetected by conventional measurement networks, could be transported unexpected directions diverging widely from predictions. ELECTRICAL CONDUCTIVITY OF PEROVSKITE-MAGNESIOWUESTITE AS A FUNCTION OF PRESSURE AND TEMPERATURE

J. Peyronneau (Institut de Physique du Globe, Paris, France.), J. P. Poirier (Institut de Physique du Globe, Paris, France.), and T. J. Shankland 1993 5 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract W-7405-eng-36)
(DE94-002714; LA-UR-93-3654; CONF-930676-61) Avail: CASI HC A01/MF A01

The high pressure transformation products of olivine, (Mg(sub 1-x),Fe(sub x))(sub 2)SiO4--the most abundant mineral in the Earth's upper mantle--are perovskite (Mg,Fe)SiO3 and magnesiowuestite (Mg,Fe)O. These materials are considered the principal components of the lower mantle, which comprises about 2/3 of Earth's volume. We measured the electrical conductivity (sigma) of a perovskite-magnesiowuestite mixture transformed by laser heating in a diamond anvil cell. From a starting material of San Carlos olivine having x=0.16 the high pressure phases were (Mg(sub 1-x),Fe(sub x))SiO3 with x=0.08 and (Mg(sub 1-x),Fe(sub x))O with x=0.24. Iron-magnesium partitioning was determined by TEM and x-ray microanalysis. During conductivity measurements the sample was heated to 400C by an external heater at different pressures to 40 GPa. To derive activation energy and activation volume the data were simultaneously fitted to the equation (sigma)=(sigma)(sub o)exp(-(Delta)U-P(delta)V)/kT. Conductivities extrapolated to lower mantle conditions are of order 1-10 S/m, in good agreement with geophysical models. DOE

A PRELIMINARY METHOD FOR ATMOSPHERIC SOUNDINGS IN REAL TIME USING SATELLITE AND GROUND-BASED REMOTELY SENSED DATA Final Report

James Cogan and Aldo Izaguirre Jul. 1993 45 p
(AD-A274381; ARL-TR-240) Avail: CASI HC A03/MF A01

A near-real-time sounding of the atmosphere from the surface to less than or equal to 30 km may be obtained by combining atmospheric profiles from meteorological (met) satellite and a ground-based system for remotely sensing wind and temperature. This type of capability is essential for optimum use of Army assets such as artillery and defense against biological and chemical attack. This report describes the method for merging data from satellite and ground-based remote-sensing systems and briefly discusses the algorithms used to evaluate the combined soundings. The current software allows the user to generate output in a standard form or in the format of an artillery met message. Initial results of this merging method are compared with data from nearly coincident rawinsondes. Preliminary comparisons of individual combined and rawinsonde sounding pairs, and individual met message zones for a number of sounding pairs, give an initial insight into the technique and the satellite/ground-based system concept. NONLINEAR HYSTERESIS IN AN ENDOCHRONIC SOLID Final Report, 3 Nov. 1991 - 3 Nov. 1993

Jean-Bernard Minster 4 Jan. 1994 17 p
(Contract F19628-88-K-0039)
(AD-A274594) Avail: CASI HC A03/MF A01

Propagation of seismic waves in the nearfield where rock rheology is demonstrably nonlinear raises unique difficulties. Nonlinearity arises primarily in two forms at intermediate to large strains: (1) nonlinear elasticity, and (2) amplitude-dependent attenuation. The proper representation of nonlinear constitutive equations for rocks in this regime is a potentially important ingredient of quantitative source models. We have shown previously that nonlinear one-dimensional wave propagation can result in spectral distortions at all wavelengths. This effect is strongly pulse-shape dependent, and therefore, calls for a 3-D capability. More recently, we found that our approximate description of the phenomenology in the nonlinear regime was inadequate and unable to simulate new laboratory observations. We describe an intrinsically nonlinear rheological model, based on the endochronic framework of K. Valanis, which replicates the main features of observed hysteresis loops in the strain regime of interest and is easily reduced to differential form. The resulting differential equations can be readily solved numerically. Thus, this model is suitable for finite difference and finite element stress wave codes. Ultimately, a complete description of the rheology in terms of a thermodynamically valid constitutive equation is really what should be used in numerical simulations, if it can be developed and validated experimentally. GEOLOGICAL DATING BY Ar-40 - Ar-39 METHOD Ph.D. Thesis [FECHAMIENTO GEOLOGICO POR EL METODO: 40 AR - 39 AR]

M. E. VollbertRomero 1992 90 p In SPANISH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601975; INIS-mf-13617) Avail: CASI HC A05 (US Sales Only)

The isotope K40 is radioactive, it decays to Ar-40 stable. The number of Ar-40 atoms produced from K-40, permits to calculate the date of rocks and minerals. This dating technique is named 'Conventional K-Ar Dating Method'. The Ar-40 - Ar-39 dating method permits to calculate the age of rocks and minerals eliminating the limitation of the K-Ar method by calculating potassium and argon concentrations in a single measurement of the ratio of argon isotopes. The irradiation of the sample with fast neutrons in the nuclear reactor was established. Ar-39 is obtained from the induced reaction K-39 (n,p) Ar-39. Thus the ratio of (Ar-39)-(Ar-39) allows to obtain the date of rocks and minerals. This ratio was measured in a mass spectrometer. If the measurement of argon concentration in the sample is carried out at different increasing temperature values, it is possible to get information of paleotemperatures. The number of atoms Ar-39 is a function of the number K-39 atoms, irradiation time, neutrons flux, its energy E and the capture cross section sigma of K-39. These parameters are calculated indirectly by obtaining the so called 'J value ' by using a standard mineral with known age (HD-BI y Biot-133), this mineral is irradiated together with the unknown age sample. The values of 'J' obtained are in the interval of 2.85 to 3.03 x 10(exp -3)J/h. Rocks from 'Tres Virgenes' were dated by the method described, showing an agreement with previous values of different authors. The age of these rocks are from Cenozoico era, mainly in the miocene period. DOE

ELASTIC WAVE UP/DOWN DECOMPOSITION IN INHOMOGENEOUS AND ANISOTROPIC MEDIA: AN OPERATOR APPROACH AND ITS APPROXIMATIONS
Maarten V. deHoop (Schlumberger Cambridge Research, England.) and Adrianus T. deHoop 1993 56 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-126497; ET/EM-1993-16) Copyright Avail: CASI HC A04/MF A01

A structural operator approach to the up/down decomposition of elastic waves in inhomogeneous and anisotropic media is presented. First, the up/down decomposition is carried out; next, a decomposition of the wave field into its polarization constituents is worked out. The procedure is discussed in detail for the class of orthorhombic media and includes lateral variations. The high-frequency approximation to the operator approach is shown to be amenable to matrix manipulations in the horizontal Fourier transform domain. Two-level parabolic approximations are carried out to find sparse matrix (finite-difference) representations of the relevant operators. Finally, the space-time peculiarities and artifacts associated with the parabolic approximation to the particle velocity of the wave motion generated by a point force in a homogeneous and isotropic solid are discussed. (PB94-123718; IRF-SR-213) Avail: CASI HC A05/MF A02

In ionospheric and atmospheric physics, the importance of multi-station imaging has grown as a consequence of the availability of scientific grade CCD cameras with digital output and affordable massive computing power. Tomographic inversion techniques are used in many different areas, e.g. medicine, plasma research, and space physics. The tomography workshop was announced to gather a limited group of people interested in auroral tomography or tomographic inversion methods in general. ALIS (Auroral Large Imaging System) is a multi-station ground-based system developed primarily for three-dimensional auroral imaging, however, other non-auroral objects can be studied with ALIS, e.g. stratospheric clouds. Several of the contributions in the workshop dealt with problems related to geometries similar to the ALIS-configuration. NTIS

TIME DOMAIN REFLECTOMETRY FOR MEASURING BULK SOIL ELECTRICAL CONDUCTIVITY AND COMPARISON WITH THE EM38 INSTRUMENT
P. C. Slik May 1993 71 p
(PB94-125432; REPT-35) Avail: CASI HC A04/MF A01

The purpose of the report is to investigate the capability of Time Domain Reflectometry (TDR) to measure water content and bulk soil electrical conductivity (EC(sub a)) simultaneously and to compare these values with electromagnetic (EM38) induction measurements for five different soil profiles. The study sites all had a natural vegetation. Horizontal and vertical EM38 measurements were taken at intervals of 10 cm above soil surface to a height of 1.3 meter. TDR is found to be a quick method for determining an EC(sub a) profile in comparison with soil sampling. NTIS

CRUSTAL DEFORMATION MEASUREMENTS IN THE VICINITY OF VANDENBERG AIR FORCE BASE Final Report, 1 Jun. 1989 - 28 Feb. 1993
Robert W. King 16 Aug. 1993 6 p
(Grant AF-AFOSR-0400-89)
(AD-A274166; AFOSR-93-0882TR) Avail: CASI HC A02/MF A01

Recent geological and geodetic studies have suggested that the region surrounding Vandenberg AFB is undergoing active crustal deformation. This has important implications for both the geodetic stability and the seismogenic potential of the Western Test Range (WTR). Part of the evidence for significant deformation was obtained from GPS measurements which we carried out in cooperation with other university and government scientists beginning in late 1986. These measurements were made annually through 1991 over a broad region of central and southern California but were of insufficient spatial and temporal density to answer important questions about the seismogenic potential of Vandenberg. This data book summarizes upper atmosphere physics data acquired by the Upper Atmosphere Physics Monitoring System at Syowa Station in 1990. The items of observations at Syowa Station are geomagnetism (H-, D-, and Z-components of magnetic variations, total force of the geomagnetic field, H-, D- and Z-components of magnetic pulsations), ELF (Extremely Low Frequency)-VLF (Very Low Frequency) wave (intensities and wide-band signal of ELF-VLF emissions), ionosphere (cosmic noise absorption) and aurora (all sky camera, scanning photometer, fixed directional photometer, multi-channel photometer, all sky TV, monochromatic CCD (Charged Coupled Device) TV (Television) and Fabry-Perot Doppler Imaging System), and those at Asuka Station are geomagnetism (H-, D- and Z-components of magnetic variations and magnetic pulsations), ionosphere (cosmic noise absorption and differential doppler measurement of NNSS (National Navigation Satellite System) telemetry signals) and aurora (all sky camera and fixed directional photometer). It contains an outline of Upper Atmosphere Physics Monitoring System, specifications of the observation instruments and the data acquisition system, recording periods, the format of the compiled digital data, and magnetograms in the period of January 1 to December 31, 1990 at Syowa Station and Asuka Station. This symposium concerns ionosphere and magnetosphere in the polar regions based on data acquired by satellite observation, tethered rocket, atmospherics, ground observation, balloon observation, computer simulation, etc. The presentation included studies on High Frequency (HF) wave, Very Low Frequency (VLF) wave and Ultra Low Frequency (ULF) wave observation, and Pi2 cavity and global Pc5 pulsation concerning ULF wave. For phenomena relating substorm, polar cap, polar shower, aurora oval, plasma regime, Birkeland currents, plasmapheric disturbances are presented. Magnetosphere-ionosphere coupling included topics concerning observation of aurora, field-aligned potential drop structure and ion temperature. For heliosphere and magnetopause study, structure of the polar region of the outer heliosphere and solar coronal region, observation by Geophysical Tail (GEOTAIL) satellite, and stratospheric and tropospheric changes were presented. Geomagnetic storms concerning statistical study, polar cap absorption, thermosphere, airglow emission enhancements, electric field enhancements, and low-latitude aurorae were reported. There were presentations of stratospheric balloon experiments and polar patrol balloon project, phenomena relating aurorae, and future observation plans. Author (NASDA)

New numerical methods are developed for the simulation of wave propagation in the vicinity of a cylindrical object. These methods are suitable for the solution of wave propagation problems in a completely heterogeneous medium. A review of the mathematical methods used in numerical seismic modeling serves as a background to the new methods developed in this work. It includes the basic principles which lead to the creation of numerical solutions for the acoustic as well as the elastic wave equations. The 2-dimensional Chebyshev-Fourier cylindrical numerical grid is presented. It comprises the non-periodic Chebyshev expansion in the radial direction and the periodic Fourier expansion in the angular direction. We solve the acoustic wave equation using this same grid. The boundary conditions are applied using one-dimensional considerations, namely the characteristic variables of the wave equation. An elastic rheology is introduced. The elastic wave equation is solved on the 2-dimensional Chebyshev-Fourier cylindrical numerical grid. In order to stabilize the numerical scheme, we have to adopt a multi-domain approach. The numerical mesh is constructed from a few smaller ring shaped grids. The mesh that results is the 2-D multi-domain Chebyshev-Fourier cylindrical grid. The different subdomains can represent either solid or liquid material. The solution to the problem of wave propagation in the vicinity of a borehole is presented. Author (ISA)

Results are presented of the study of the two kinds of the Extremely Low Frequency (ELF) ray propagation from the equatorial plane to the polar region with the observation of ELF and Very Low Frequency (VLF) waves by the International Satellite for Ionosphere Studies (ISIS) over Antarctica, ELF waves at Showa Station, Antarctica, and Bremsstrahlung X-rays by balloons. Conditions for the existence of penetrating ray paths are obtained from a two-dimensional ray tracing. Wave normal directions and arriving latitudes at low altitudes are also calculated. The calculated characteristics of ELF wave normals are compared with those from ISIS satellite observation in the altitude range of 1,450 to 3,500 km by means of spin-modulated characteristics and multi-ion cutoff characteristics of received ELF signals. Seasonal variation of ELF emission intensity at the ISIS satellite altitude and on the ground is attributable to a north-south asymmetry in the penetrating ray paths depending on a field-aligned electron density gradient in the both hemispheres. Another mode of ELF wave propagation, i.e., ducted propagation outside the plasmapause, is investigated for periodic emissions. ELF emissions observed on the ground are compared with Bremsstrahlung X-rays observed by balloons. Three balloon experiments were carried out in northern Norway and at Showa Station, Antarctica, and the observed Bremsstrahlung X-rays and ELF emissions were compared for three characteristic time scales: slow variations (a few tens of minutes), pulsations (from a few tens of seconds to several minutes) and bursts (less than 10 seconds). (Contract NASw-4744)
(NASA-CR-195237; NAS 1.26:195237) Avail: CASI HC A05/MF A01

This report documents investigations carried out over the twelve month period which commenced in November 1992. The contract identifies the following three tasks: analysis of the O II 83.4 nm dayglow and comparison with incoherent scatter radar data, analysis of the EUV spectrum of an electron aurora, and analysis of the EUV spectrum of a proton-hydrogen-electron aurora. The analysis approach, data reduction methods, and results, including plots of O I 98.9 nm versus time and average spectra, are presented for the last two tasks. The appendices contain preprints of two papers written under the first task. The first paper examines the effect of new O(3P) photoionization cross sections, N2 photoabsorption cross sections, and O(+) oscillator strengths and transition probabilities on the O II 83.4 nm dayglow. The second addresses the problem of remotely sensing the dayside F2 region using limb O II 83.4 nm data. CASI

This report summarizes the progress made in the first year of NASA Grant No. NAGW-3508 entitled 'Modeling of the Coupled Magnetospheric and Neutral Wind Dynamos.' The approach taken has been to impose magnetospheric boundary conditions with either pure voltage or current characteristics and solve the neutral wind dynamo equation under these conditions. The imposed boundary conditions determine whether the neutral wind dynamo will contribute to the high-latitude current system or the electric potential. The semi-annual technical report, dated December 15, 1993, provides further detail describing the scientific and numerical approach of the project. The numerical development has progressed and the dynamo solution for the case when the magnetosphere acts as a voltage source has been evaluated completely using spectral techniques. The simulation provides the field-aligned current distribution at high latitudes due to the neutral wind dynamo. A number of geophysical conditions can be simulated to evaluate the importance of the neutral wind dynamo contribution to the field-aligned current system. On average, field-aligned currents generated by the neutral wind dynamo contributed as much as 30 percent to the large-scale field-aligned current system driven by the magnetosphere. A term analysis of the high-latitude neutral wind dynamo equation describing the field aligned current distribution has also been developed to illustrate the important contributing factors involved in the process. The case describing the neutral dynamo response for a magnetosphere acting as a pure current generator requires the existing spectral code to be extended to a pseudo-spectral method and is currently under development. IONOSPHERIC CALIBRATION FOR SINGLE FREQUENCY ALTIMETER MEASUREMENTS Final Report
William S. Schreiner, George H. Born, and Robert E. Markin 21 Mar. 1994 26 p
(Grant NAG1-1491)
(NASA-CR-195709; NAS 1.26:195709) Avail: CASI HC A03/MF A01

This study is a preliminary analysis of the effectiveness (in terms of altimeter calibration accuracy) of various ionosphere models and the Global Positioning System (GPS) to calibrate single frequency altimeter height measurements for ionospheric path delay. In particular, the research focused on ingesting GPS Total Electron Content (TEC) data into the physical Parameterized Real-Time Ionospheric Specification Model (PRISM), which estimates the composition of the ionosphere using independent empirical and physical models and has the capability of adjusting to additional ionospheric measurements. Two types of GPS data were used to adjust the PRISM model: GPS receiver station data mapped from line-of-sight observations to the vertical at the point of interest and a grid map (generated at the Jet Propulsion Laboratory) of GPS derived TEC in a sun-fixed longitude frame. The adjusted PRISM TEC values, as well as predictions by the International Reference Ionosphere (IRI-90), a climatological (monthly mean) model of the ionosphere, were compared to TOPEX dual-frequency TEC measurements (considered as truth) for a number of TOPEX sub-satellite tracks. For a 13.6 GHz altimeter, a Total Electron Content (TEC) of 1 TECU 10(exp 16) electrons/sq m corresponds to approximately 0.218 centimeters of range delay. A maximum expected TEC (at solar maximum or during solar storms) of 10(exp 18) electrons/sq m will create 22 centimeters of range delay. Compared with the TOPEX data, the PRISM predictions were generally accurate within the TECU when the sub-satellite track of interest passed within 300 to 400 km of the GPS TEC data or when the track passed through a night-time ionosphere. If neither was the case, in particular if the track passed through a local noon ionosphere, the PRISM values differed by more than 10 TECU and by as much as 40 TECU. The IRI-90 model, with no current ability to unseat GPS data, predicted TEC to a slightly higher error of 12 TECU. The performance of PRISM is very promising for predicting TEC and will prove useful for calibrating single frequency altimeter height measurements for ionospheric path delay. When adjusted to the GPS line-of-sight data the PRISM URSI empirical model predicted TEC over a day's period to within a global error of 8.60 TECU rms during a nighttime ionosphere and 9.74 TECU rms during the day. When adjusted to the GPS derived TEC grid, the PRISM parametrized model predicted TEC to within an error of 8.47 TECU rms for a nighttime ionosphere and 12.83 TECU rms during the day. However, the grid cannot be considered globally due to the lack of sufficient numbers of GPS stations and large latitude gaps in GPS data. It is the opinion of the authors that using the PRISM model and adjusting to the global sun-fixed TEC grid regenerated with a localized weighted interpolation offers the best possibility of meeting the 10 TECU global rms (or 2 cm at 13.6 GHz) ionosphere range correction accuracy requirement of TOPEX/Poseidon and should be the subject of further study. However, it is clear that the anticipated requirement of 34 TECU global rms for TOPEX/Poseidon Follow-On (corresponding to the TOPEX/Poseidon performance) can not be met with any realizable combination of existing models and data assimilation schemes. ENERGY PARAMETERS OF THE INCIDENT AURORAL ELECTRONS DERIVED BY THE INTENSITY RATIO OF AURORAL EMISSIONS [TAHACHO FOTO META KANSOKU NI YORU KOKA DENSHI ENERUGI PARAMETA NO SUITEI] **c32**

Takayuki Ono, Ryusuke Satake (University of Electro-Communications, Chofu, Japan.), Takeo Yoshino (University of Electro-Communications, Chofu, Japan.), and Takeo Hirasawa *In its* Antarctic Record, Vol. 36, No. 2 30 Jul. 1992 p 163-180 In JAPANESE (For primary document see N94-27963 07-46)
Avail: CASI HC A03/MF A02

Average energy and total energy flux of the incident electrons in active auroras are estimated by using the intensity ratio of auroral emissions measured with a multi-channel photometer at Showa Station, Antarctica, in 1990. To avoid possible ambiguities which are mainly caused by quenching effects on metastable species and complex excitation processes, the intensity ratios of the emissions of allowed transitions were used such as 844.6 nm (OI), 670.5 nm (N2 1PG (Positive Bands)), and 427.8 nm (N2(+) 1NG (Negative Bands). Measured intensity ratios were directly compared with the result of model calculation of auroral emissions. The estimated energy parameters in active auroras showed a rapid change of average energy as well as total energy flux of electrons associated with pulsating auroras and intense auroral arcs. Average energy and total energy flux of the auroral electrons determined by the present method were consistent with the result of the previous insitu observations of precipitating electrons. These data analyses on active arcs in break-up phase showed that usage of the 427.8 nm emission has difficulty due to a scattering effect of the atmosphere. Usage of 670.5 nm emission in place of 427.8 nm made it possible to evaluate the energy parameters of electrons even in the vicinity intense auroral arcs. Author (NASDA)

CHARACTERISTICS OF 30-MHz INTERFERENCE NOISES OBSERVED BY RIOMETERS [RIOMETA DE KANSOKU SARETA 30 MHZ KONSHIN NO SEISHITSU]

Akira Yukimatsu *In* National Inst. of Polar Research, Antarctic Record, Vol. 36, No. 2 30 Jul. 1992 p 181-202 In JAPANESE (For primary document see N94-27963 07-46)
Avail: CASI HC A03/MF A02

In 1989, when the sun was highly active, interference noises were often observed by 30 MHz riometers at Asuka and Showa Stations in Antarctica. The noises showed a systematic diurnal and seasonal variation. The noises were global phenomena because they were also seen in other riometer data at high and middle latitudes in the Northern Hemisphere. These noises were investigated in connection with ionospheric f(sub 0)F(sub 2) data, geomagnetic K(sub p) indices and sunspot numbers. The results are summarized as follows: (1) interference noises consist mainly of ground radio waves reflected by the ionosphere; (2) the interference noise occurrence shows a good correlation with f(sub 0)F(sub 2); and (3) the noise intensity shows a tendency of decreasing on weekends, and [illegible] feature suggests that the noises are mainly of artificial origins. It is concluded, therefore, that the occurrence feature of the interference noises reflects the condition of the ionosphere, and can be used as an indicator of the global electromagnetic wave environment in HF (High Frequency) range. A LABORATORY TEST ON CONSTRUCTION OF ICE DOMES AND THEIR LOAD-CARRYING CAPACITY [AISU DOMU MOKEI NO SHISAKU TO KYODO SHIKEN]

Toshio Hannuki, Kenji Ishizawa (National Inst. of Polar Research, Tokyo, Japan.), Kenji Futami, and Keita Tsukui *In* National Inst. of Polar Research, Antarctic Record, Vol. 36, No. 2 30 Jul. 1992 p 203-226 In JAPANESE (For primary document see N94-27963 07-46)
Avail: CASI HC A03/MF A02

Ice domes will be useful as a shelter of depot and laboratory space without heating systems which will be constructed on the ice field in the Arctic or Antarctic. Efficacious use of ice domes is discussed for facilities of research camp in the Antarctic. Some experiments on construction technique of ice domes and their load-carrying capacity were carried out in a low temperature laboratory. It was confirmed experimentally that ice domes could be made by spraying water onto a spherically inflated membrane form under the condition of holding a temperature below -18 C. Mechanical property of artificial ice made in the laboratory was examined by some bending tests of simply supported ice beams so as to discuss a constitutive model of ice for numerical analysis. Load-carrying capacity and creep behavior of ice dome models were examined in the laboratory and analytical models of ice structure for a numerical procedure of the design were discussed and compared with the tests. A usefulness of elastic-plastic model for the mechanical behavior of ice structures in a short term loading and a convenience of Maxwell model for the long time creep of ice structure were confirmed in the discussion. These laboratory tests and analytical applications led to the first step of realization of the ice dome construction in the Antarctic. Author (NASDA)

An eight by eight beam imaging riometer with a view field of 180 km by 180 km, spatial resolution of 20 km, and time resolution of 1 to 4 s was developed in Japan. System design is described with some stress on the difference from the first Imaging Riometer System (IRIS), developed by the University of Maryland. This system has a unique capability of displaying absorption image on the real time basis with the aid of QL (Quick Look) software, which is summarized in a separate paper. The performance of the array antenna system is confirmed by simulation calculations using the galactic radio noise map at 30 MHz obtained by Cane. Procedures for absorption image forming are also described. Some of the absorption images obtained by this system are compared with optical auroral images observed at the same location at the same time. It is found that the both images show a good similarity for morning-side auroras. It is, therefore, concluded that the imaging riometer is a very useful tool for monitoring the auroral form when the optical aurora observation is difficult by the sunlit, or weather condition. QUICK-LOOK SYSTEM OF AURORAL ABSORPTION IMAGES BY IMAGING RIOMETER [IMEJINGA RIOMETA KYUSHU GAZO KYU ERU SHISUTEMU NO KAIHATSU] **c74**

Mitsugi Sato, Hisao Yamagishi, Yasuo Kato, and Masanori Nishino *In* National Inst. of Polar Research, Antarctic Record, Vol. 36, No. 2 30 Jul. 1992 p 251-267 In JAPANESE Original contains color illustrations (For primary document see N94-27963 07-46)
Avail: CASI HC A03/MF A02

Imaging riometer of two-dimensional multi-narrow beams is a powerful radio instrument to investigate the structure of CNA (Cosmic Noise Absorption) in the auroral ionosphere caused by the precipitation of energetic electrons. However, the instrument has a demerit of delay-look for imaging because of the use of a large capacity computer for data processing. QL (Quick-Look) system of the imaging riometer was developed by using a personal computer. This system has a function to view the CNA images in real time. QDC's (Quiet Day Curves) which indicate the condition of quiet ionosphere are determined from daily variations of cosmic noise intensity obtained during the initial ten days. Thereafter the QDC's are set into real-time data processing as a reference. The QL system has an advantage for real-time comparison with auroral images by the all-sky TV (Television) camera. Purpose and methods of crystallographic analyses of clathrate hydrates included in ice cores recovered at Vostok, Antarctica are briefly reviewed. The clathrate hydrate is a crystal composed of a cage structure formed by water molecules, and includes individual air molecules in the molecular cages. The crystallographic structure of the clathrate hydrate crystals found in deep ice cores determined by x ray diffraction and Raman scattering measurements is described, and the formation process of the crystals in the ice sheet is discussed. It is also discussed as a future prospect in core analysis that what kind of information and knowledge relating to climatic changes can be deduced from the crystallographic analysis of the clathrate hydrates. COUNTING ADELIE PENGUINS AT COLONIES: SEASONAL AND ANNUAL CHANGES [KORONI DENO ADERI PENGIN NO KAUNTO: KISETSU HENKA TO NEN HENKA] c51

In its Antarctic Record, Vol. 36, No. 2 30 Jul. 1992 p 279-284 In JAPANESE (For primary document see N94-27963 07-46)

Avail: CASI HC A02/MF A02

The number of Adelie penguin (Pygoscelis adeliae) adults at colonies around Showa Station changes seasonally. The penguins started to arrive at the colonies on October 20-25. The number of adults at each colony reached its maximum on November 10-20, decreased until late November and was stable on December 1-10. This seasonal pattern was consistent over years and colonies. Censuses in mid-November and early December are recommended since they could give reliable numbers of breeding pairs. Author (NASDA)

NOTE ON THE STRUCTURE OF MOSS COLONIES COMPOSED OF TWO SPECIES ON KING GEORGE ISLAND, THE SOUTH SHETLAND ISLANDS [KINGUJOJITO NO NI SHU YORI NARU SENRUI KORONI NO KOZO NI TSUITE] c51

Takayuki Nakatsubo and Shuji Otani (National Inst. of Polar Research, Tokyo, Japan.) *In* National Inst. of Polar Research, Antarctic Record, Vol. 36, No. 2 30 Jul. 1992 p 285-293 Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan (For primary document see N94-27963 07-46)

Avail: CASI HC A02/MF A02

Moss colonies composed of two species Sanionia uncinata and Bryum pseudotriquetrum are abundant in the vicinity of Great Wall Station on King George Island. Vertical cross-sections of these colonies were examined to know the colony structure indicating the interaction between the two species. In several colonies, a layer composed of Bryum pseudotriquetrum was partially covered with shoots of Sanionia uncinata. In some other colonies, a layer composed of Sanionia uncinata was partially covered with shoots of Bryum pseudotriquetrum. For the rest of the colonies, both species coexisted without covering each other. It is concluded that the proportion of the two species in a colony has changed through the colony growth, but the direction of the change varies among the colonies at each site. Author (NASDA)

OBSERVATION OF THE UPPER ATMOSPHERE PHYSICS AT ASUKA STATION BY THE 30TH JAPANESE ANTARCTIC RESEARCH EXPEDITION IN 1989 [DAI 30 JI NANKYOKU CHIIKI KANSOKUTAI ASUKA KANSOKU KYOTEN ETTOTAI (1989): CHUKUKEI HOKOKU]

Akira Yukimatsu *In* National Inst. of Polar Research, Antarctic Record, Vol. 36, No. 2 30 Jul. 1992 p 294-309 In JAPANESE (For primary document see N94-27963 07-46)

Avail: CASI HC A03/MF A02

Observations of the upper atmosphere physics at Asuka Station from 1 Jan. to 24 Dec. 1989, carried out by the 30th Japanese Antarctic Research Expedition (JARE-30) are described. In JARE-30 one research member of the upper atmosphere physics was wintering at Asuka Station, and several instruments were newly installed so as to observe auroral phenomena in conjunction with Showa Station, Iceland observations, and scientific satellites. Characteristics of the JARE-30's observations at Asuka Station are as follows: (1) the observation of Cosmic Noise Absorption (CNA) with a 30 MHz riometer was made throughout the year; (2) a fixed direction and a tracking photometers were newly installed, and spatial and temporal developments of aurora photo emissions in various wave lengths were observed; (3) an all sky camera used in JARE-28 was re-installed; (4) an all sky SIT (Silicon Intensifier Target)-TV (Television) camera was newly installed so as to observe auroral motions with high time resolution; (5) a digital data recorder was installed for the auroral photometric data; (6) Z-component of an Ultra Low Frequency (ULF) induction magnetometer which had been in trouble was recovered, so the three components of both a fluxgate magnetometer and the induction magnetometer could be observed; and (7) in 1989, the solar activity was very high and there were many interesting geophysical events, and auroral phenomena. GPS (Global Positioning System) differential positioning test on the Antarctic penetrator was made at the Aoyama Pasture in Hokkaido. The reference GPS receiving site was chosen at 200 km southwest of the Aoyama Pasture, taking the planned operation on the Soer Rondane Mountains 400 km profile in Antarctica into consideration. Three dummy penetrators were dropped twice by changing the release height in the range from 160 to 1,000 m above the ground. Six impact positions of the deployed penetrators were determined by a relative carrier phase measurement to an accuracy of 0.1 m, and the position results were compared with the post-processed GPS differential positions. When 10 to 20 sec duration GPS position data could be acquired at an interval of 1 sec before and after the release instance of the penetrator, the estimated impact position by tracing the falling trajectory was found to be within 30 m offset from the actual impact location determined by the relative carrier phase measurement. When the GPS hovering data could be acquired for at least 1 minute duration just above the impact crater, the calculated impact location via the hovering-helicopter GPS position data was found to be within 10 m offset from the actual impact location. The height accuracy of GPS differential positioning was +/- 10 m which is considered to degrade to +/- 20 m when the coordinates of the reference GPS receiving site were determined by the time-average of point-positioning results. OBSERVATION WITH STS SEISMOMETER AT NAKAIZU, CENTRAL JAPAN: OBSERVATION SYSTEM AND COMPARISON WITH TILTMETER [NAKAIZU NI OKERU STS JISHIN KANSOKU: KANSOKU HOSHIKI OYOBI KEISHAKEI TONO HIKAKU]
Yoshimitsu Okada and Mizuho Ishida *In its* Report of the National Research Institute for Earth Science and Disaster Prevention, No. 51 31 Mar. 1993 p 1-22 In JAPANESE (For primary document see N94-27985 07-46)
Avail: CASI HC A03/MF A03

A broad-band seismometer, STS-1 was equipped in the vault of Nakaizu Observatory, central Japan, in March, 1988. To record and transmit the observed seismic waveform, a data acquisition system, PDAS-100, was introduced for its ability of flexible data recording schedule, resolution enhancement by over-sampling and off-line telemetry with dial-out mode. To utilize the obtained data, some basic software systems are developed as well as those for routine data processing. They include the functions to store the data, to list the files, to operate filtering, differentiation, and integration, and to display the processed waveforms with arbitrary scaling and time interval. As tilt observation by pendulum-type tiltmeter continued in the same vault, both records were compared with each other. This tiltmeter is adopting a force balanced feed back system which is the same principle as that employed in STS seismometer. It was confirmed that the waveforms for local and global earthquakes are almost identical in both time and frequency domains. It is expected that borehole tiltmeters of this type can work as excellent horizontal broad-band seismometers.

Avail: CASI HC A03/MF A03

To study the underground structure in the south-eastern part of the Kanto Plain and the Miura Peninsular, a seismic prospecting survey traverse with a length of 42 km was carried out between Midori Ward in Yokohama City and Miura City, Kanagawa Prefecture. There were three explosion sites and sixty observation sites. The results can be divided into four groups. First, the underground structure of the investigated area is approximately divided into two parts: the south and the north near the roots of the Miura Peninsular. Second, the north is characterized by a simple structure consisting of three gently sloping, almost horizontal layers with P-wave seismic velocities of 2.0, 2.3, and 3.0 km/s respectively (top to bottom) and a layer with a P-velocity of 4.7 km/s under these layers. The 4.7 km/s layer, whose lowermost point is 4 km beneath the surface, is located in the vicinity of Konan Ward in Yokohama City. Third, in the south there are three layers with P-wave velocities of 2.3-2.4, 3.6, and 4.7 km/s respectively. The 3.0 km/s layer found in the north disappears and is assumed to change to the 3.6 km/s layer instead. The uppermost depth of the 3.6 km/s layer is about 0.5 km, which displays upheaval structure near the middle of the Miura Peninsular. Finally, the underground structure obtained from the P-wave velocity profile in this study is in harmony with the supposed geological structure.

ANALYSIS OF S-WAVE SEISMOGRAM ENVELOPE OF DEEP EARTHQUAKES AND ESTIMATION OF RANDOM INHOMOGENEITIES IN THE KANTO-TOKAI AREA [KANTO TOKAI CHIKI NI OKERU SHINKAI JISHIN NO S HA ENBEROPU NO TOKUCHO TO FUKINSHITSU KOZO NO SUITEI]
Kazushige Obara *In its* Report of the National Research Institute for Earth Science and Disaster Prevention, No. 51 31 Mar. 1993 p 41-202 In JAPANESE (For primary document see N94-27985 07-46)
Avail: CASI HC A08/MF A03

Seismogram envelopes around direct S waves of deep earthquakes which occurred in the subducting Pacific plate were analyzed based on the parabolic approximation and random inhomogeneity of the upper mantle and the crust. The upper mantle and the crust were investigated in the Kanto-Tokai area, Japan. The time lags of the maximum peak arrival and the half-maximum arrival were measured from the S wave onset of Band Path Filter (BPF)-Root Mean Square (RMS) traces of a horizontal seismogram at some frequency bands. The dependence of shape of the envelopes on frequency and travel distance was examined. The random inhomogeneity beneath the east edge of the seismic network was estimated to be represented by the Gaussian Autocorrelation Function (ACF). The function type is a little bit close to the exponential type in the west part of the volcanic front. The difference in the ACF type might be attributed to the difference in the short wavelength component's inhomogeneity.

DETECTION OF WATER ON ROAD SURFACE BY THE POLARIZED LIGHT [HENKO NI YORU ROMEN NO NURE NO KANSHUTSU] c74
Tadashi Kimura *In its* Report of the National Research Institute for Earth Science and Disaster Prevention, No. 51 31 Mar. 1993 p 203-208 In JAPANESE (For primary document see N94-27985 07-46)
Avail: CASI HC A02/MF A03

This report explains the working principle, structure, and performance of a new detector of water on a road surface paved with concrete by polarized light. Near the polarizing angle, reflected light from the road surface includes vertical and horizontal polarized components. Intensity difference of the two polarized lights is very small on the dry road surface. On the wet road surface, the vertical component decreases much more than horizontal component. Based on the above mentioned fact, experiments to detect water on a road surface were carried out using a rotating polarizer (41.3 rps) and a silicon pinphotodiode under the sunlight. Experimental results showed that this system could remotely detect water on the road surface over the area of a few square meters.

DEVELOPMENT OF A METHOD FOR PREDICTING SNOWFALL INTENSITY AND COMPACTED SNOW ON ROADS [KOSETSU KYODO TO ROMEN ASSETSU YOSOKU SHUHO NO KAIHATSU] c43
Hisayuki Funada, Kuniyuki Senkuro, Muneo Matsukawa, and Tadashi Ishisaka (Toyama Prefectural Office, Japan.) *In* the National Research Inst. for Earth Science and Disaster Prevention, Report of the National Research Institute for Earth Science and Disaster Prevention, No. 51 31 Mar. 1993 p 209-219 In JAPANESE (For primary document see N94-27985 07-46)
Avail: CASI HC A03/MF A03

Heat balance analysis was carried out using the data which were obtained during three winter seasons, 1988-1991. After classifying measurements of traffic counter according to weekday, Monday-Friday and holiday, Saturday, Sunday, and national holiday, figures were made showing relation between snowfall intensity, the road surface minimum temperature, and compacted snow. An on-line system, in which variables such as present temperature and situation of a road surface at fixed points were automatically gathered, was made. It has been possible to predict road surface minimum temperature by connecting these variables with some other variables given by an existing system, MICOS (Meteorological Information Confidential On-line System)-LAN (local area network). As a result, a method for predicting icing and compacted snow on roads was developed. Author (NASDA)

CONCEPTION OF SNOW INFORMATION NETWORK SYSTEM IN YAMAGATA PREFECTURE [YAMAGATA-KEN NAI NO YUKI SHORI JOHO SHISUTEMU NO KOSO] **c43**

Masuyoshi Matsuda, Hiroshi Nishimura, and Tsugio Nakashima (Yamagata Prefectural Office, Japan.) *In* the National Research Inst. for Earth Science and Disaster Prevention, Report of the National Research Institute for Earth Science and Disaster Prevention, No. 51 31 Mar. 1993 p 221-246 In JAPANESE (For primary document see N94-27985 07-46)

Avail: CASI HC A03/MF A03

Yamagata Prefecture, located in the northern portion of the main island of Japan, is covered with snow for four months during winter. Heavy snowfall, blizzards, and road-surface freezing cause not only hazards to traffic, but suffering to all aspects of people's daily life and socioeconomic activities. This study aims at elaborating the plan of the network system regarding snow information in Yamagata Prefecture and building up its prototype, after careful inspection of the meteorological and snow/ice hazard conditions in this prefecture. PERSISTENCE OF AURORAL ELECTRON FLUX EVENTS FROM DMSP/F9 ELECTRON MEASUREMENTS Report No. 3

K. H. Bounar and W. J. McNeil 31 Jan. 1992 54 p

(Contract F19628-90-C-0191)

(RXR-92012; PL-TR-92-2019) Avail: CASI HC A04/MF A01

The persistence of auroral electron activity is examined and correlated to the geomagnetic activity, which is measured by the Kp index. To study this correlation, the superposed epoch analysis technique was implemented. Epoch zero is the time at which Kp values persisted above a specified threshold value for a specified duration. It was found that a high correlation between enhanced Kp and the number of bright arcs can be achieved for a limited time. The waiting time to increase the chance of observing bright auroral arcs after enhanced Kp values are observed should be between 3 to 6 hours. Further, the substantial increase in the number of observations of intense events as a result of enhanced Kp lingers a maximum of 36 to 48 hours. After this time period, this number drops to the average number of random observations. Author (revised)

AN INTEGRATED APPROACH TO SEISMIC EVENT LOCATION: 1. EVALUATING HOW METHOD OF LOCATION AFFECTS THE VOLUME OF GROUPS OF HYPOCENTERS Report No. 1

Clifford A. Frohlich 12 Nov. 1992 34 p

(Contract F19628-91-K-0026)

(PL-TR-92-2323) Avail: CASI HC A03/MF A01

When seismic events occur in spatially compact clusters, the volume and geometric characteristics of these clusters often provides information about the relative effectiveness of different location methods, or about physical processes occurring within the hypocentral region. This report defines and explains how to determine the convex polyhedron of minimum volume (CPMV) surrounding a set of points. We evaluate both single-event and joint hypocenter determination (JHD) relocations for three rather different clusters of seismic events: (1) nuclear explosions from Muroroa relocated using P and PKP phases reported by the ISC; (2) intermediate depth earthquakes near Bucaramanga, Colombia, relocated using P and PKP phases reported by the ISC; and (3) shallow earthquakes near Vanuatu (formerly, the New Hebrides), relocated using P and S phases from a local station network. This analysis demonstrates that different location methods markedly affect the volume of the CPMV, however, volumes for JHD relations are not always smaller than volumes for single-event relocations. Ground based measurements from the CANOPUS array of meridian scanning photometers and precipitating ion and electron data from the DMSP F9 satellite show that the electron arc which brightens to initiate substorm intensifications is formed within a region of intense proton precipitation that is well equatorward (approximately four to six degrees) of the nightside open-closed field line boundary. The precipitating protons are from a population that is energized via earthward convection from the magnetotail into the dipolar region of the magnetosphere and may play an important role in the formation of the electron arcs leading to substorm intensifications on dipole-like field lines. NEW DEVELOPMENTS REGARDING THE KT EVENT AND OTHER CATASTROPHES IN EARTH HISTORY

1994 150 p Proceedings held in Houston, TX, 9-12 Feb. 1994

(Contract NASw-4574)

(NASA-CR-195169; NAS 1.26:195169; LPI-CONTRIB-825) Avail: CASI HC A07/MF A02

Papers presented at the conference on New Developments Regarding the KT Event and Other Catastrophes in Earth History are included. Topics covered include: trajectories of ballistic impact ejecta on a rotating earth; axial focusing of impact energy in the earth's interior: proof-of-principle tests of a new hypothesis; in search of Nemesis; impact, extinctions, volcanism, glaciations, and tectonics: matches and mismatches. For individual titles, see N94-28295 through N94-28314.

TRAJECTORIES OF BALLISTIC IMPACT EJECTA ON A ROTATING EARTH Abstract Only

W. Alvarez *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 2-3 (For primary document see N94-28294 07-46)

Avail: CASI HC A01/MF A02

On an airless, slowly rotating planetary body like the Moon, ejecta particles from an impact follow simple ballistic trajectories. If gaseous interactions in the fireball are ignored, ejecta particles follow elliptical orbits with the center of the planetary body at one focus until they encounter the surface at the point of reimpact. The partial elliptical orbit of the ejecta particle lies in a plane in inertial (galactic) coordinates. Because of the slow rotation rate (for example, 360 degrees/28 days for the Moon), the intersection of the orbital plane and the surface remains nearly a great circle during the flight time of the ejecta. For this reason, lunar rays, representing concentrations of ejecta with the same azimuth but different velocities and/or ejecta angles, lie essentially along great circles. Ejecta from airless but more rapidly rotating bodies will follow more complicated, curving trajectories when plotted in the coordinate frame of the rotating planet or viewed as rays on the planetary surface. The curvature of trajectories of ejecta particles can be treated as a manifestation of the Coriolis effect, with the particles being accelerated by Coriolis pseudoforces. However, it is more straightforward to calculate the elliptical orbit in inertial space and then determine how far the planet rotates beneath the orbiting ejecta particle before reimpact. The Earth's eastward rotation affects ballistic ejecta in two ways: (1) the eastward velocity component increases the velocity of eastbound ejecta and reduces the velocity of westbound ejecta; and (2) the Earth turns underneath inflight ejecta, so that although the latitude of reimpact is not changed, the longitude is displaced westward, with the displacement increasing as a function of the time the ejecta remains aloft. AXIAL FOCUSING OF IMPACT ENERGY IN THE EARTH'S INTERIOR: PROOF-OF-PRINCIPLE TESTS OF A NEW HYPOTHESIS Abstract Only

M. B. Boslough, E. P. Chael, T. G. Trucano, M. E. Kipp, and D. A. Crawford *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 14-16 (For primary document see N94-28294 07-46)
(Contract DE-AC04-76DP-00789)
Avail: CASI HC A01/MF A02

A causal link between major impact events and global processes would probably require a significant change in the thermal state of the Earth's interior, presumably brought about by coupling of impact energy. One possible mechanism for such energy coupling from the surface to the deep interior would be through focusing due to axial symmetry. Antipodal focusing of surface and body waves from earthquakes is a well-known phenomenon which has previously been exploited by seismologists in studies of the Earth's deep interior. Antipodal focusing from impacts on the Moon, Mercury, and icy satellites has also been invoked by planetary scientists to explain unusual surface features opposite some of the large impact structures on these bodies. For example, 'disrupted' terrains have been observed antipodal to the Caloris impact basis on Mercury and Imbrium Basin on the Moon. Very recently there have been speculations that antipodal focusing of impact energy within the mantle may lead to flood basalt and hotspot activity, but there has not yet been an attempt at a rigorous model. A new hypothesis was proposed and preliminary proof-of-principle tests for the coupling of energy from major impacts to the mantle by axial focusing of seismic waves was performed. Because of the axial symmetry of the explosive source, the phases and amplitudes are dependent only on ray parameter (or takeoff angle) and are independent of azimuthal angle. For a symmetric and homogeneous Earth, all the seismic energy radiated by the impact at a given takeoff angle will be refocused (minus attenuation) on the axis of symmetry, regardless of the number of reflections and refractions it has experienced. Mantle material near the axis of symmetry will experience more strain cycles with much greater amplitude than elsewhere and will therefore experience more irreversible heating. The situation is very different than for a giant earthquake, which in addition to having less energy, has an asymmetric focal mechanism and a larger area. Two independent proof-of-principle approaches were used. The first makes use of seismic simulations, which are being performed with a realistic Earth model to determine the degree of focusing along the axis and to estimate the volume of material, if any, that experiences significant irreversible heating. The second involves two-dimensional hydrodynamic code simulations to determine the stress history, internal energy, and temperature rise as a function of radius along the axis. Author (revised)

IN SEARCH OF NEMESIS Abstract Only

c89

S. Carlson, T. Culler, R. A. Muller, M. Tetreault, and S. Perlmutter *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 19-20 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

The parallax of all stars of visual magnitude greater than about 6.5 has already been measured. If Nemesis is a main-sequence star 1 parsec away, this requires Nemesis's mass to be less than about 0.4 solar masses. If it were less than about 0.05 solar masses its gravity would be too weak to trigger a comet storm. If Nemesis is on the main sequence, this mass range requires it to be a red dwarf. A red dwarf companion would probably have been missed by standard astronomical surveys. Nearby stars are usually found because they are bright or have high proper motion. However, Nemesis's proper motion would now be 0.01 arcsec/yr, and if it is a red dwarf its magnitude is about 10 - too dim to attract attention. Unfortunately, standard four-color photometry does not distinguish between red dwarfs and giants. So although surveys such as the Dearborn Red Star Catalog list stars by magnitude and spectral type, they do not identify the dwarfs. Every star of the correct spectral type and magnitude must be scrutinized. Our candidate list is a hybrid; candidate red stars are identified in the astrometrically poor Dearborn Red Star Catalog and their positions are corrected using the Hubble Guide Star Catalog. When errors in the Dearborn catalog make it impossible to identify the corresponding Hubble star, the fields are split so that we have one centering on each possible candidate. We are currently scrutinizing 3098 fields, which we believe contain all possible red dwarf candidates in the northern hemisphere. Since our last report the analysis and database software has been completely rebuilt to take advantage of updated hardware, to make the data more accessible, and to implement improved methods of data analysis. The software is now completed and we are eliminating stars every clear night. Author

IMPACTS, EXTINCTIONS, VOLCANISM, GLACIATIONS, AND TECTONICS: MATCHES AND MISMATCHES Abstract Only

I. W. D. Dalziel *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 28-29 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

The debate concerning possible reactions between impacts, extinction events, and volcanism has recently taken a new turn. Diamictites and associated sedimentary deposits long regarded by geologists as glaciogenic, have been reinterpreted as impact-related. Going further, the Permo-Carboniferous diamictites that are widespread in the southern continents and India are not put forward as evidence that fragmentation of the Gondwana supercontinent in the Mesozoic was a direct result of meteorite impact. In an abstract at a meeting of the American Geophysical Union, and in an article in the popular press, one member of the earth science community has made a specific claim to identify the site of the supercontinent-destroying bolide on the Falkland/Malvinas Plateau. It is claimed by this scientist that the Cape Fold belt in Africa represents a 'breaking wave' of deformation resulting from this impact, and that fractures in the clasts of the Dwyka diamictite in southern Africa represent impact-induced cataclasis of the target rock. These hypotheses fly in the face of the well-established tectonic history of the Gondwana supercontinent in several respects. Author (revised)

THE END-PERMIAN MASS EXTINCTION: A COMPLEX, MULTICAUSAL EXTINCTION Abstract Only

D. H. Erwin *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 33-34 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

The end-Permian mass extinction was the most extensive in the history of life and remains one of the most complex. Understanding its causes is particularly important because it anchors the putative 26-m.y. pattern of periodic extinction. However, there is no good evidence for an impact and this extinction appears to be more complex than others, involving at least three phases. The first began with the onset of a marine regression during the Late Permian and resulting elimination of most marine basins, reduction in habitat area, and increased climatic instability; the first pulse of tetrapod extinctions occurred in South Africa at this time. The second phase involved increased regression in many areas (although apparently not in South China) and heightened climatic instability and environmental degradation. Release of gas hydrates, oxidation of marine carbon, and the eruption of the Siberian flood basalts occurred during this phase. The final phase of the extinction episode began with the earliest Triassic marine regression and destruction of nearshore continental habitats. Some evidence suggests oceanic anoxia may have developed during the final phase of the extinction, although it appears to have been insufficient to the sole cause of the extinction. SCIENCE OBSERVED: THE MASS-EXTINCTION DEBATES Abstract Only

W. Glen *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 44-45 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

The upheaval triggered in 1980 by the Alvarez-Berkeley group impact hypothesis transformed the literature of mass extinctions from an unfocused, sporadic collection of papers that virtually ignored extraterrestrial causes and treated endogenous ones only sparingly better to an integrated, diverse body of literature. Research programs organized seemingly overnight spawned collaborative teams whose members, often from distant, isolated disciplines, redirected their careers in order to address the captivating, high-stakes issues. The initial, generally skeptical, cool reception of the impact hypothesis might have been predicted for any of a number of reasons: such an instantaneous catastrophe contravened earth science's reigning philosophy of uniformitarianism; it was formulated from a form of evidence - siderophile element anomalies - alien to the community charged with its appraisal; it advanced a causal mechanism that was improbable in terms of canonical knowledge; and it was proffered mainly by specialists alien to earth and biological science, especially paleobiology. Early on it became clear that irrespective of which causal hypothesis was chosen, the chosen one would be the strongest predictor of how the chooser would select and apply standards in assessing evidence bearing on all such hypothesis. Less strong correlation also appeared between disciplinary speciality and the assessment of evidence. Such correlations varied with the level of specialization; the most robust correlations appeared in the broadest areas of science practice. The gestalt (mindset) seemingly engendered by the embrace of an extinction hypothesis overrode, or was stronger than, the intellectual predispositions attributable to disciplinary specialty. CONSEQUENCES OF IMPACTS OF SMALL ASTEROIDS AND COMETS WITH EARTH Abstract Only
J. G. Hills *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 50 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

The fragmentation of a small asteroid in the atmosphere greatly increases its cross sections for aerodynamic braking and energy dissipation. At a typical impact velocity of 22 km/s, the atmosphere absorbs more than half the kinetic energy of stony meteoroids with diameters, D(sub m), less than 220 m and iron meteoroids with D(sub m) less than 80 m. The corresponding diameter for comets with impact velocity 50 km/s is D(sub m) less than 1600 m. Most of the atmospheric energy dissipation occurs in a fraction of a scale height, so large meteors appear to 'explode' or 'flare' at the end of their visible paths. This dissipation of energy in the atmosphere protects the earth from direct impact damage (e.g., craters), but it produces a blast wave that can do considerable damage. The area of destruction around the impact point in which the over-pressure in the blast wave exceeds 4 lb/sq in = 2.8 x 10(exp 5) dynes/cu cm, which is enough to knock over trees and destroy buildings, increases rapidly from zero for chondritic meteoroids less than 56 m in diameter (15 megatons) to about 200 sq km for those 80 m in diameter (48 megatons); the probable diameter of the tunguska impactor of 1908 is about 80 m. Crater formation and earthquakes are not significant in land impacts by stony asteroids less than about 200 m in diameter because of the air protection. A tsunami is probably the most devastating type of damage for asteroids 200 m to 1 km in diameter. An impact by an asteroid this size anywhere in the Atlantic would devastate coastal areas on both sides of the ocean. An asteroid a few kilometers across would produce a tsunami that would reach the foothills of the Appalachian Mountains in the upper half of the East Coast of the United States. Most of Florida is protected from a tsunami by the gradual slope of the ocean off its coast, which causes most of the tsunami energy to be reflected back into the Atlantic. The atmosphere plume produced by asteroids with diameters exceeding about 120 m cannot be contained by the atmosphere, so this bubble of high-temperature gas forms a new layer on top of the atmosphere. The dust entrapped in this hot gas is likely to have optical depths exceeding tau = 10 for asteroids with diameters exceeding about 0.5 to 1 km. The optical flux from asteroids 60 m or more in diameter is enough to ignite pine forests. However, the blast wave from an impacting asteroid goes beyond the radius in which the fire starts. The blast wave tends to blow out the fire, so it is likely that the impact will char the forest, as at Tunguska, but the impact will not produce a sustained fire. Because comets dissipate their energy much higher in the atmosphere than asteroids, they illuminate a much larger region and their blast wave is weaker. So they are much more effective in producing large fires. This suggests that the KT impactor was a comet rather than an asteroid. Author (revised)

MASS EXTINCTIONS: PERSISTENT PROBLEMS AND NEW DIRECTIONS Abstract Only
D. Jablonski *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 56-57 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

Few contest that mass extinctions have punctuated the history of life, or that those events were so pervasive environmentally, taxonomically, and geographically that physical forcing factors were probably involved. However, consensus remains elusive on the nature of those factors, and on how a given perturbation - impact, volcanism, sea-level change, or ocean anoxic event - could actually generate the observed intensity and selectivity of biotic losses. At least two basic problems underlie these long-standing disagreements: difficulties in resolving the fine details of taxon ranges and abundances immediately prior to and after an extinction boundary and the scarcity of simple, unitary cause-and-effect relations in complex biological systems. Derived from text

THE BIOSTRATIGRAPHY AND PALEOGEOGRAPHY OF MAASTRICHTIAN INOCERAMIDS Abstract Only
K. G. MacLeod, B. T. Huber, and P. D. Ward (Washington Univ., Seattle.) *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 74-75 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

The global distribution of Maastrichtian inoceramids is now known in enough detail that the patterns of disappearance can be used to place first-order constraints on paleoceanographic changes that may have occurred during that age. The Inoceramidae is an excellent group to focus on in a study of Maastrichtian events for the following reasons: (1) they were globally distributed in the early Maastrichtian; (2) they did not survive the age (i.e., they undergo change during the interval); and (3) they have left a rich microfossil and macrofossil record. Some inoceramids grew to be very large; however, even the largest often passively disaggregated and are preserved as hundreds of millions of characteristic, columnar, polygonal prisms of calcite approximately 100 microns across. This taphonomic process has greatly increased the inoceramid fossil record and provides a means of objectively estimating changes in their standing population. In addition, because these prisms commonly occur in Deep Sea Drilling Project (DSDP) and Ocean Drilling Program (ODP) cores, it is relatively easy to generate a truly global database. The existing macrofossil record of inoceramids has less temporal and spacial resolution but greater taxonomic resolution than the microfossil record. In concert the microfossil and macrofossil records of inoceramids demonstrate that important changes occurred during the Maastrichtian. These changes are distinct from the KT boundary catastrophe but are part of the larger KT transition. Author (revised)

AN EVALUATION OF CRITERIA THAT MAY BE USED TO IDENTIFY SPECIES SURVIVING A MASS EXTINCTION Abstract Only c51
N. MacLeod *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 75-77 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

One of the most difficult obstacles to establishing a causal connection between mass extinctions and large body impacts is the existence of what appear to be many more KT survivor species than previously suspected. Though interpretations of 'Cretaceous' faunal elements in lowermost Danian sediments differ, this enigmatic fauna has not been recovered from every biozone-complete boundary section, including the El Kef stratotype. In terms of their potential for providing constraints on scenarios seeking to account for the KT extinction event, the significance of such observations cannot be overstated. Owing to the consistency with which these observations have been made over the last several years, the possibility of widespread trans-KT biotic survivorship can no longer be dismissed. Rather, the survivorship hypothesis must be tested alongside its alternative (the reworking hypothesis) to determine which explains the available data in the most complete yet parsimonious manner. Moreover, valid tests for survivorship cannot be based on negative evidence or on the assumption that only a small cohort of species could have survived the KT boundary event. Several authors have recently proposed various criteria that might be used to test alternative interpretations for this aspect lowermost Danian biotic record. Author (revised)

MODULATING TERRESTRIAL IMPACTS FROM OORT CLOUD COMETS BY THE ADIABATICALLY CHANGING GALACTIC TIDES Abstract Only

J. J. Matese, P. G. Whitman, K. A. Innanen (York Univ., Toronto, Ontario.), and M. J. Valtonen (Turku Univ., Finland.) *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 78-80 (For primary document see N94-28294 07-46)

Avail: CASI HC A01/MF A02

Time modulation of the flux of new Jupiter-dominated Oort cloud comets is the subject of interest here. The major perturbation of these comets during the present epoch is due to the tidal field of the relatively smooth distribution of matter in the galactic disk. A secondary source of the near-parabolic comet flux are stars penetrating the inner Oort cloud and providing impulses that create brief comet showers. Substantial stellar-induced showers occur approximately every 100 m.y. Less frequent (but stronger) impulses due to giant molecular clouds can also perturb comets from the inner cloud. These occur on timescales of approximately equal to 500 m.y. In contrast to these infrequent stochastic shower phenomena is the continuously varying tidal-induced flux due to the galaxy. As the Sun orbits the galactic center it undergoes quasiharmonic motion about the galactic midplane, which is superimposed on the small eccentricity, near-Keplerian motion in the plane having epicycle period approximately equal to 150 m.y. In the process the galactic tidal field on the Sun/cloud system will vary causing a modulation of the observable Oort cloud flux. We have created a model of the galactic matter distribution as it affects the solar motion over a time interval ranging from 300 m.y. in the past to 100 m.y. into the future. As constraints on the disk's compact dark matter component we require consistency with the following: (1) the observed galactic rotation curve, (2) today's flux distribution of new comets, (3) the studies of K-giant distributions, and (4) the periodicity found in the terrestrial cratering record. The adiabatically varying galactic tidal torque is then determined and used to predict the time dependence of the flux. We find that a model in which approximately half the disk matter is compact is consistent with these constraints. Under such circumstances the peak-to-trough flux variation will be approx. equal to 5:1 with a full width of 9 m.y. This variability will manifest in the terrestrial cratering record and is consistent with the observed cratering periodicity, if over half of the impacts on Earth are caused by comets or asteroids that originate in the outer Oort cloud. Author (revised)

SOME IMPLICATIONS OF LARGE IMPACT CRATERS AND BASINS ON VENUS FOR TERRESTRIAL RINGED CRATERS AND PLANETARY EVOLUTION Abstract Only c91

W. B. McKinnon and J. S. Alexopoulos *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 81-82 (For primary document see N94-28294 07-46)

Avail: CASI HC A01/MF A02

Approximately 950 impact craters have been identified on the surface of Venus, mainly in Magellan radar images. From a combination of Earth-based Arecibo, Venera 15/1, and Magellan radar images, we have interpreted 72 as unequivocal peak-ring craters and four as multiringed basins. The morphological and structural preservation of these craters is high owing to the low level of geologic activity on the venusian surface (which is in some ways similar to the terrestrial benthic environment). Thus these craters should prove crucial to understanding the mechanics of ringed crater formation. They are also the most direct analogs for craters formed on the Earth in Phanerozoic time, such as Chicxulub. We summarize our findings to date concerning these structures. Author (revised)

PROPOSED LAW OF NATURE LINKING IMPACTS, PLUME VOLCANISM, AND MILANKOVITCH CYCLES TO TERRESTRIAL VERTEBRATE MASS EXTINCTIONS VIA GREENHOUSE-EMBRYO DEATH COUPLING Abstract Only c45

D. M. McLean *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 82-83 (For primary document see N94-28294 07-46)

Avail: CASI HC A01/MF A02

A greenhouse-physiological coupling killing mechanism active among mammals, birds, and reptiles has been identified. Operating via environmental thermal effects upon the maternal core-skin blood flow critical to the survival and development of embryos, it reduces the flow of blood to the uterine tract. Today, during hot summers, this phenomena kills embryos on a vast, global scale. Because of sensitivity of many mammals to modern heat, a major modern greenhouse could reduce population numbers on a global scale, and potentially trigger population collapses in the more vulnerable parts of the world. In the geological past, the killing mechanism has likely been triggered into action by greenhouse warming via impact events, plume volcanism, and Earth orbital variations (Milankovitch cycles). Earth's biosphere is maintained and molded by the flow of energy from the solar energy source to Earth and on to the space energy sink (SES). This SES energy flow maintains Earth's biosphere and its living components, as open, intermediate, dissipative, nonequilibrium systems whose states are dependent upon the rate of energy flowing through them. Greenhouse gases such as CO2 in the atmosphere influence the SES energy flow rate. Steady-state flow is necessary for global ecological stability (autopoiesis). Natural fluctuations of the C cycle such as rapid releases of CO2 from the mantle, or oceans, disrupt steady-state SES flow. These fluctuations constantly challenge the biosphere; slowdown of SES energy flow drives it toward thermodynamical equilibrium and stagnation. Fluctuations induced by impact event, mantle plume volcanism, and Milankovitch cycles can grow into structure-breaking waves triggering major perturbations of Earth's C cycle and mass extinctions. A major C cycle perturbation involves readjustment of the outer physiochemical spheres of the Earth: the atmosphere, hydrosphere, and lithosphere; and by necessity, the biosphere. A greenhouse, one manifestation of a major C cycle perturbation, is the most dangerous natural phenomenon that life on Earth can experience. Greenhouse conditions existed during the KT mass extinctions of 65 m.y. ago, and the Pleistocene-Holocene (P-H) mammalian extinctions of 10,000-12,000 yr ago. Coupling climatology to reproductive physiology via effects of ambient air temperature upon uterine blood flow to developing embryos accounts for the extinctions via established physiological principles. EXTRATERRESTRIAL ACCRETION AND GLACIAL CYCLES Abstract Only c90

R. A. Muller *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 85-86 (For primary document see N94-28294 07-46)

Avail: CASI HC A01/MF A02

We propose that the approx. 100-k.y. cycle seen in terrestrial glaciation is due to changes in meteor flux that come from changes in the Earth's orbit. This model can explain a 70-k.y. 'anomalous' period in climate data and the apparent discrepancy between present extraterrestrial fluxes and those in oceanic sediments. It can be tested by measuring Ir densities in sediments and ice during glacials and interglacials. Author

AN EXTRATERRESTRIAL EVENT AT THE TERTIARY-QUATERNARY BOUNDARY Abstract Only c90

H. Peng *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 88-89 (For primary document see N94-28294 07-46)

Avail: CASI HC A01/MF A02

During the North Pacific Manganese Nodules Investigation in 1983, we collected a large-diameter core M14 (8 deg. 00.15 N, 176 deg, 10.65 W; 3991-m depth of water). This gravity core is 420 cm long in total. It is composed of calcureous ooze at 0-320 cm and siliceous ooze at 320-420 cm of depth. A great number of microtektites were found at 270-300 cm (average content is 15 microtektites per 100-g sediment). Because abundant microtektites are restricted to a 30-m-thick zone of deep-sea core, we called this zone the microtektite layer. The age of the sedimentary stratum containg microtektites is 2.14-2.30 m.y., corresponding to the Pliocene to

Pleistocene Periods as indicated by paleomagnetic and paleontologic analysis. We can give the following two primary conclusions: (1) the core M14 microtektites are products of a major meteorite or asteroid impact 2.14-2.30 m.y. ago; and (2) the age of 2.14-2.30 m.y. is an important geological age; perhaps it is just a correct age for dividing the Tertiary/Quarternary boundary. This result is quite close to previous data. Author

A GENERAL THEORY OF IMPACTS AND MASS EXTINCTIONS, AND THE CONSEQUENCES OF LARGE-BODY IMPACT ON THE EARTH Abstract Only

M. R. Rampino *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 91-92 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

The theory that large-body impacts are the primary cause of mass extinctions of life on the Earth now has a sound theoretical and observational foundation. A convergence of evidence suggests that the biosphere may be a sensitive detector of large impact events, which result in the recorded global mass extinction pulses. The astronomically observed flux of asteroids and comets in the neighborhood of the Earth, and the threshold impact size calculated to produce a global environment catastrophe, can be used to predict a time history of large impact events and related mass extinctions of life that agrees well with the record of approx. 24 extinction events in the last 540 m.y. Avail: CASI HC A01/MF A02

Extraterrestrial impacts are firmly implicated in several of the five major Phanerozoic extinction events. A critical issue now is whether extraterrestrial events have been the only mechanism that produced physical changes of sufficient magnitude to cause major extinction events. While we believe the evidence is overwhelming that the KT extinction event was caused by an impact, we also find that an event of similar or larger size near the end of the Ordovician is best explained by terrestrial causes. The Ordovician extinction event (End-O extinction event) occurred near the end of the Ordovician, but the interval of extinction was completed prior to the newly established Ordovician-Silurian boundary. In spite of extensive field studies, a convincing signature of an associated impact has not been found. However, a prominent glaciation does coincide with the End-O extinction event. Author

Avail: CASI HC A01/MF A02

There have been brief periods since the beginning of the Cambrian some 600 m.y. ago when mass extinctions destroyed a significant fraction of living species. The most widely studied of these events is the catastrophe at the KT boundary that ended the long dominance of the dinosaurs. In addition to mass extinctions, there is another profound discontinuity in the history of Earth's biota, the explosion of life at the end of the Precambrian era which is an episode that is not explained well at all. For some 3 b.y. before the Cambrian, life had been present on Earth, but maintained a low level of activity which is an aspect of the biota that is puzzling, especially during the last two-thirds of that period. During the last 2 b.y. before the Cambrian, conditions at the Earth's surface were suitable for a burgeoning of the biota, according to most criteria: the oceans neither boiled nor were fozen solid during this time, and the atmosphere contained sufficient O for the development of animals. The purpose of this paper is to suggest that mass extinctions and the lackluster behavior of the Precambrian biota share a common cause: an inadequate amount of ozone in the atmosphere. Author

THE CRASH OF P/SHOEMAKER-LEVY 9 INTO JUPITER AND ITS IMPLICATIONS FOR COMET BOMBARDMENT ON EARTH Abstract Only c91

E. M. Shoemaker and C. S. Shoemaker *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 113-114 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

Periodic Comet Shoemaker/Levy 9 will impact Jupiter in late July 1994. The comet, which broke into more than 20 telescopically detectable fragments when it passed with the Roche lobe of Jupiter on July 8, 1992, is captured in a highly eccentric orbit about Jupiter. The 21 recognized nuclei will be spread out in a train of the order 7 x 10(exp 6) km long at the time of impact, and the impacts will be spread in time over about 5 1/2 days centered on about July 21.2 UT. In addition to the train of recognized bright nuclei, the comet consists of 'wings' of unresolved bodies that are the source of a very broad composite dust tail. The linear extent of the wings is about an order of magnitude greater than that of the train of recognized discrete nuclei. Collision of the wings will be spread in time over several months. Thus the impact of P/S-L 9 with Jupiter will be an event of appreciable duration. Derived from text

SUPERNOVAE AND MASS EXTINCTIONS Abstract Only

S. vandenBergh *In* Houston Univ., New Developments Regarding the KT Event and Other Catastrophes in Earth History 1994 p 127 (For primary document see N94-28294 07-46)
Avail: CASI HC A01/MF A02

Shklovsky and others have suggested that some of the major extinctions in the geological record might have been triggered by explosions of nearby supernovae. The frequency of such extinction events will depend on the galactic supernova frequency and on the distance up to which a supernova explosion will produce lethal effects upon terrestrial life. In the present note it will be assumed that a killer supernova has to occur so close to Earth that it will be embedded in a young, active, supernova remnant. Such young remnants typically have radii approximately less than 3 pc (1 x 10(exp 19) cm). Larger (more pessimistic?) killer radii have been adopted by Ruderman, Romig, and by Ellis and Schramm. From observations of historical supernovae, van den Bergh finds that core-collapse (types Ib and II) supernovae occur within 4 kpc of the Sun at a rate of 0.2 plus or minus 0.1 per century. Adopting a layer thickness of 0.3 kpc for the galacitc disk, this corresponds to a rate of approximately 1.3 x 10(exp -4) supernovae pc(exp -3) g.y.(exp -1). Including supernovae of type Ia will increase the total supernovae rate to approximately 1.5 x 10(exp -4) supernovae pc(exp -3) g.y.(exp -1). For a lethal radius of R pc the rate of killer events will therefore be 1.7 (R/3)(exp 3) x 10(exp -2) supernovae per g.y. However, a frequency of a few extinctions per g.y. is required to account for the extinctions observed during the phanerozoic. With R (extinction) approximately 3 pc, the galactic supernova frequency is therefore too low by 2 orders of magnitude to account for the major extinctions in the geological record. Author

WIND MEASUREMENTS WITH AN INCOHERENT LIDAR

G. J. Kunz 12 Jul. 1993 76 p
(AD-A273756; FEL-93-A040; TDCK-TD-93-0485) Avail: CASI HC A05/MF A01

Atmospheric structures can be measured with incoherent optical radars (lidars). Because these structures drift with the wind, they can serve as a tracer for remote sensing of the wind vector. For this purpose, a dual monostatic scanning lidar system is available to measure the atmosphere simultaneously in two different directions over a maximum range of about 1 km. The transit time of identified patterns between two sensing points in the horizontal plane provides in combination with the geometry of the lidar, sufficient information to derive the horizontal wind vector. The method is based on cross-correlation techniques. To determine the spatial wind vector as a function of altitude it is sufficient to measure in three different upward directions. This can be realized with a triple lidar or with a single lidar by measuring consecutively in three different directions and using an equivalent but more extended inversion method. DTIC

DEVELOPMENT AND TESTING OF THE COUPLED Ocean/Atmosphere MESOSCALE PREDICTION SYSTEM (COAMPS) Final Report
Richard M. Hodur Nov. 1993 84 p
(AD-A273925; NRL/MR/7533-93-7213) Avail: CASI HC A05/MF A01

A three-dimensional coupled ocean/atmosphere mesoscale prediction system (COAMPS) has been developed, consisting of a nonhydrostatic atmospheric model and a hydrostatic ocean model. The models can be integrated simultaneously so that the surface fluxes of heat, momentum, and moisture are exchanged across the air-water interface every time step. Optionally, either the atmospheric model or the ocean model can be used as a stand-alone system. Two idealized simulations of a hurricane are performed In the first simulation, only the atmospheric model is used, assuming a fixed sea surface temperature. A realistic hurricane structure with spiral bands develops. Evidence is found of concentric eye walls interacting to modify the intensification of the hurricane. In the second simulation, the ocean model is run simultaneously with the atmospheric model. After 84 hours, the sea surface temperature decreases more than 8 C within the radius of maximum winds. While this has a large impact on the intensity of the system (i.e., the strength of the maximum winds), there is little change in the overall structure of the system as measured by the tangential velocities outside the radius of maximum winds. DEVELOPING PREDICTION REGIONS FOR A TIME SERIES MODEL FOR HURRICANE FORECASTING M.S. Thesis
William Cheman Dec. 1993 68 p
(AD-A273777; AFIT/GSO/ENS/93D-03) Avail: CASI HC A04/MF A01

In this thesis, a class of time series models for forecasting a hurricane's future position based on its previous positions and a generalized model of hurricane motion are examined and extended. Results of a literature review suggest that meteorological models continue to increase in complexity while few statistical approaches, such as linear regression, have been successfully applied. An exception is provided by a certain class of time series models that appear to forecast storms almost as well as current meteorological models without their tremendous complexity. A suggestion for enhancing the performance of these time series models is pursued through an examination of the forecast errors produced when these models are applied to historical storm tracks. The results uncover no patterns that can be exploited in developing an improved model and suggest that there are meteorological processes or factors at work beyond those that can be modeled with the available historical data base. The statistical structure of the time series approach is exploited to develop a practical method for determining prediction regions which probabilistically describe a hurricane's likely future position. The Monte Carlo approach used to develop these prediction ellipses is seen to be applicable for predicting areas subject to risk from hurricane landfall. DTIC

CATALOG OF ABSOLUTELY CALIBRATED, RANGE NORMALIZED, WIDEBAND, ELECTRIC FIELD WAVEFORMS FROM TRIGGERED LIGHTNING FLASHES IN FLORIDA Interim Report
Yataka Izumi and John C. Willett 22 Jun. 1993 106 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A273793; AD-E201708; PL-TR-93-2151; ERP-1124) Avail: CASI HC A06

During the summer of 1987, a rocket-triggered-lightning program was conducted at NASA KSC, Florida. The rocket triggering was performed from two trigger platforms--one over water and the other over land. The propagation paths from the two sites were almost entirely over brackish water. This report presents waveform plots of the electric-field time derivative, the electric field, and the high-frequency spectral density at 5 MHz. DTIC

THE EFFECT OF ELEVATION DATA REPRESENTATION ON NOCTURNAL DRAINAGE WIND SIMULATIONS
H. Walker and J. M. Leone, Jr. Aug. 1993 12 p Presented at the 2nd International Workshop in Integrating Geographic Information Systems and Environmental Modeling, Breckenridge, CO, 27-29 Sep. 1993
(Contract W-7405-eng-48)
(DE94-003624; UCRL-JC-112788; CONF-9309230-3) Avail: CASI HC A03/MF A01

A critical requirement for accurately representing surface-atmosphere interactions within an atmospheric model is to realistically characterize the land surface. Data must be extracted from a geographical database and transformed so that it is consistent with the needs of the numerical model. In such a process, there are two major classes of error that must be understood and minimized whenever possible. The first class involves the accuracy, precision, and resolution of the geographical data itself. The second is error introduced by the transformations used to assimilate the data into the atmospheric model. Thus, this research has two coupled objectives: to understand the effects of errors within the geographical data base upon the accuracy of the atmospheric model simulation; and to design optimal techniques for the transformation of the data. Such transformations are often constrained by the conflicting needs of representing physically important spatial and temporal scales while eliminating scales that cannot be resolved by the model. SEASONAL SNOW OF ARCTIC ALASKA R4D INVESTIGATIONS
C. S. Benson Feb. 1993 46 p
(Contract DE-FG06-84ER-60245)
(DE93-040082; DOE/ER-60245/T2) Avail: CASI HC A03/MF A01

Seasonal snow is present on the Arctic Slope of Alaska for nine months each year. Its presence or absence determines whether 80% of the solar radiation is reflected or absorbed, respectively. Although life on the Arctic Slope is adapted to, and in some cases dependent upon seasonal snow, little is known about it from a scientific point of view. Its quantity has been grossly underestimated, and knowledge of its distribution and the extent of wind transport and redistribution is very limited. This research project dealt with the amount, regional distribution and physical properties of wind blown snow and its biological role in the R4D area of the Arctic Slope. Physical processes which operate within the snow that were studied included the flux of heat and vapor and the fractionation of stable isotopes through it during fall and winter, and the complex heat and mass transfer within the snow and between snow, its substrate and the overlying atmosphere during the melt period. ACTIVE LAYER DYNAMICS AND ARCTIC HYDROLOGY AND METEOROLOGY
1993 18 p
(Contracts DE-FG06-92ER-61457; DE-FG06-84ER-60247)
(DE94-001724; DOE/ER-61457/T1) Avail: CASI HC A03/MF A01

Man's impact on the environment is increasing with time. To be able to evaluate anthropogenic impacts on an ecosystems, it is necessary first to understand all facets of how the ecosystems works: what the main processes (physical, biological, chemical) are, at what rates they proceed, and how they can be manipulated. Arctic ecosystems are dominated by physical processes of energy exchange. This project has concentrated on a strong program of hydrologic and meteorologic data collection, to better understand dominant physical processes. Field research focused on determining the natural annual and diurnal variability of meteorologic and hydrologic variables, especially those which may indicate trends in climatic change. Comprehensive compute models are being developed to simulate physical processes occurring under the present conditions and to simulate processes under the influence of climatic change. DOE

CONVERSION OF THE CLUSE MODEL FOR APPLICATIONS OVER OPEN OCEAN Final Report, Jun. 1991 - Dec. 1992
A. M. VanEijk, P. G. Mestayer, and G. DeLeeuw Aug. 1993 80 p
(AD-A273750; FEL-93-A035; TDCK-TD-930758) Avail: CASI HC A05/MF A01

The CLUSE model has been developed to describe the dynamics of (fresh water) spray droplets in the homogeneous boundary layer of an air-sea interaction simulation tunnel, and their influence on humidity and temperature profiles. Extension to open ocean conditions requires that the fresh water droplets are replaced by sea-salt aerosol, and that the influence of waves is taken into account. In this report we describe the progress on the development of the SeaCluse model that applies to open ocean conditions. The calculation of the profiles of the mean wind velocity and turbulent diffusivity has been changed to take into account the characteristics of the marine atmosphere and of the wave field. A module was added to the initialization routines that models the air flow over the waves in a non-turbulent and non-evaporative atmosphere. This module yields vertical profiles of droplet concentrations that enter in the relaxation term that models the mean movement of the particles. These profiles are then modified in the iterative budget calculation that accounts for droplet transport by atmospheric turbulence and their interaction with the humidity field by evaporation. In this part of the code, the evaporation module was changed to describe the evaporation of sea salt aerosols in the marine atmosphere. The output of the new SeaCluse model consists of vertical profiles of temperature, humidity and aerosol concentration from the sea surface up to the top of the marine atmospheric boundary layer. AN OVERVIEW OF THE TNO CONTRIBUTION TO VAST 92
G. J. Kunz and M. M. Moerman 2 Sep. 1993 42 p
(AD-A273751; FEL-93-A039; TDCK-TD-930480) Avail: CASI HC A03/MF A01

The 'Vertical Atmospheric Structure Trail' (VAST92) took place from September 28 to October 16, 1992 at the Wehr Technische Dienststelle (WTD 52), Oberjettenberg, Germany, in the framework of NATO working group AC/243 (Panel 4/RSG.8) on atmospheric propagation effects on electro-optical systems. The experiment was designed to quantify the influence of the atmospheric vertical structure variations on infrared propagation and imaging and on lidar means of remotely sensing the variations. The TNO-Physics and Electronics Laboratory participated with a lidar system, meteo and aerosol equipment. The lidar was stationed in the valley. An altimeter and meteo-equipment were mounted on the cable car. Aerosol spectrometers and meteorological equipment were used, including a sonic anemometer and a fast hygrometer to measure turbulence on the mountain. A large part of the data from these instruments is of crucial importance for the evaluation and interpretation of the data obtained by the other participants. In this report, we present an overview of the TNO instrumentation and experiments. A number of data sets have been processed to demonstrate the possibilities of the different instruments. Interpretation of the results is postponed to later reports. This report is also a guideline for processing the TNO data in conjunction with data from other participants. DTIC

TESTBED MODEL AND DATA ASSIMILATION FOR ARM
J. F. Louis 28 Apr. 1993 12 p
(Contract DE-FG02-90ER-61065)
(DE94-000432; DOE/ER-61065/3) Avail: CASI HC A03/MF A01

The ultimate objectives of this research are to further develop the ALFA (AER Local Forecast and Assimilation) model originally designed at AER for local weather prediction and apply it to several related purposes in connection with the Atmospheric Radiation Measurement (ARM) program: (1) to provide a testbed that simulates a global climate model in order to facilitate the development and testing of new cloud parametrizations and radiation models; (2) to assimilate the ARM data continuously at the scale of a climate model, using the adjoint method, thus providing the initial conditions and verification data for testing parametrizations; and (3) to study the sensitivity of a radiation scheme to cloud parameters, again using the adjoint method, thus demonstrating the usefulness of the testbed model. The data assimilation uses a variational technique that minimizes the difference between the model results and the observation during the analysis period. The adjoint model is used to compute the gradient of a measure of the model errors with respect to nudging terms that are added to the equations to force the model output closer to the data. DOE

FNAS LIGHTNING DETECTION Final Report, 28 Sep. 1992 - 27 Oct. 1993
George P. Miller and Melanie A. Alzmann 27 Oct. 1993 20 p
(Contract NAS8-38609)
(NASA-CR-193927; NAS 1.26:193927; UAH-5-33068) Avail: CASI HC A03/MF A01

A review of past and future investigations into lightning detection from space was incorporated into a brochure. Following the collection of background information, a meeting was held to discuss the format and contents of the proposed documentation. An initial outline was produced and decided upon. Photographs to be included in the brochure were selected. Quotations with respect to printing the document were requested. In the period between 28 March and June 1993, work continued on compiling the text. Towards the end of this contract, a review of the brochure was undertaken by the technical monitor. Photographs were being revised and additional areas of lightning research were being considered for inclusion into the brochure. Included is a copy of the draft (and photographs) which is still being edited by the technical monitor at the time of this report.

PROPERTIES OF THE CENTRAL AMERICAN COLD SURGE
James P. McGuirk, Philip J. Reding, and Yuxia Zhang 1993 4 p
Presented at the 20th AMF Conference on Hurricanes and Tropical Meteorology and the 9th AMF Conference on Atmospheric and Oceanic Waves and Stability, San Antonio, TX, May 1993
(Grant NAG8-845)
(NASA-CR-194849; NAS 1.26:194849) Avail: CASI HC A01/MF A01

The Central American cold surge (CACS) is a frontal incursion from the United States into Central America and resembles the East Asian cold surge. They occur more frequently than analyzed by NMC or by published results, based on our observations between 1979 and 1990. Climatology and structure are quantified, based on surface and upper air stations throughout Central America and satellite products from GOES visible and infrared sensors and SSM/I precipitable water and rain rate sensors.

A MODELING STUDY OF THE MESOCYCLONE Interim Report
Paul R. Desrochers 4 Dec. 1992 50 p
(AD-A274889; PL-TR-92-2330; ERP-1113) Avail: CASI HC A03/MF A01

The mesocyclone is a strongly-rotating column of air associated with the updraft of a severe thunderstorm. The size and shape of the phenomenon allows ready detection with a single Doppler radar. Quantitative evaluation of the mesocyclone has been shown to be useful for the prediction of large hail and tornadoes. Accuracy in mesocyclone interpretation is of course critical to these endeavors. A limitation with single-Doppler observation of the mesocyclone is that the flow field is measured directly in only one dimension. Therefore, the shape and spatial variation of intensity can be difficult to determine. For this reason, it is common practice to assume the mesocyclone flow is circularly symmetric when interpreting the single-Doppler image. The problem is that mesocyclone flows are generally not circular, and the deviation from circular can be considerable. This report presents an improved model for the interpretation of single-Doppler mesocyclone observations. The model describes an elliptical flow pattern of any eccentricity. Some examples of highly distorted, single-Doppler, mesocyclone flows are presented which are well simulated by the model. DTIC

MESOSCALE FRONTAL EVOLUTION OF THE ERICA IOP-5A CYCLONE M.S. Thesis

Steven R. Cameron Sep. 1993 81 p
(AD-A274906) Avail: CASI HC A05/MF A01

A synoptic investigation was conducted of the rapid coastal cyclogenesis that occurred during Intensive Observation Period (IOP) 5A of the Experiment on Rapidly Intensifying Cyclones over the Atlantic (ERICA). Navy Operational Regional Analysis and Prediction System (NORAPS) forecasts were examined in order to study the mesoscale frontal evolution associated with this rapidly deepening coastal cyclone. The ability of the NORAPS forecasts to accurately depict the frontal positions and intensity was also investigated. The frontal evolution showed characteristics of a classical occlusion, similar to the Norwegian cyclone model and of marine frontal structure as discussed by Shapiro and Keyser. The frontal evolution was highly influenced by the prior existence of strong arctic and coastal fronts. These fronts intensified during the course of the storm development and did not develop as a result of the cyclogenesis. DTIC

THE NUMERICAL SIMULATION OF MARINE BOUNDARY LAYER CLOUDS
Harold D. Orville 1993 3 p
(Contract N00014-91-J-4017)
(AD-A273669) Avail: CASI HC A01/MF A01

The primary objectives of the research are to numerically simulate stratus, stratocumulus, and cumulus clouds in the marine boundary layer. The research included the formation, evolution, and dissolution of the clouds and the area covered. Next, the change of convection type and the formation of cloud streets could be investigated. Another objective is to increase our understanding of conditions in the marine boundary layer. What determines the vertical profiles of humidity, temperature, and cloud characteristics in space and time? What causes the changing depth of the boundary layer? What are its interaction with the clouds in and out of the boundary layer? A third objective is to compare various numerical models among themselves and with observations. Such comparisons should indicate ways to improve the model and whether practical predictive cloud models for the marine boundary layer can be constructed. DTIC

A PRELIMINARY ANALYSIS OF THE US WEST CLIMATOLOGY
J. O. Roads, S. C. Chen, K. Ueyoshi, J. Bossert, and J. Winterkamp 1992 4 p Presented at the 17th Annual Climate Diagnostics Conference, Norman, OK, 19-23 Oct. 1992
(Contract DE-FC03-90ER-61010)
(DE94-003028; CONF-9210334-4) Avail: CASI HC A01/MF A01

In a previous paper, Roads et al. discussed the forecast accuracy of the National Meteorological Center's (NMC's) medium-range forecasts (MRF's) of various near-surface meteorological elements, such as temperature, relative humidity, and wind speed in terms of NMC's global analysis. Although these global analyses are most applicable for global perspectives, the authors are interested in more regional scales. Here one might expect the large-scale global analyses to only grossly simulate various regional effects, especially in regions that are strongly influenced by topography. At regional scales, a mesoscale model, which is overlying mesoscale topography and which is forced at the boundary and initialized with a large scale analysis, could provide an even better representation of the regional behavior. In a similar manner, a regional model initialized and forced at the horizontal boundaries by general circulation model (GCM) variables might provide more detailed spatial representation of climatic change than is available from statistical interpolations or simple linear interpolations of the large-scale GCM output to the regional scale. Coastal Transition Zone (CTZ) Experiments were conducted off the California Coast near Pt. Arena by the Office of Naval Research (ONR). One of the basic goals of these experiments was: 'To understand the role of the atmosphere in driving coastal ocean currents and to learn of possible ocean-atmosphere feedback.' This principal investigator acted as a focal person for the meteorology of the CTZ experiments providing meteorological expertise to the other investigators. Our basic objectives were: (1) Documentation of the meteorological conditions during each field study; and (2) Data reduction plus analysis-synthesis of the meteorological conditions for each field study. OVERALL ANALYSIS OF METEOROLOGICAL INFORMATION IN THE DAEDUK NUCLEAR COMPLEX
Byung Woo Kim, Young Bok Lee, Moon Hee Han, Eun Han Kim, Kyung Suk Suh, Won Tae Hwang, and Suk Boong Hong Dec. 1992 116 p In KOREAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-632594; KAERI/RR-1175/92) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

Trouble shooting of the tower structure, sensor installation, and grounding and cabling were completed in an integrated field-test. Establishment of the data acquisition system and instrument calibration have been finished since the completion of the main tower construction earlier this year. A procedure guide covering instrument operation, calibration, and repair was also completed. Actual measurements were performed during Oct. and Nov. after the system equipment integration was completed. The occurrence of nocturnal inversion layers, fog, and frequent conditions of atmospheric stability were shown as the analysis results of measured data which represent the seasonal and regional characteristics of the site. Wireless data transmission to the MIPS (Meteorological Information Processing System) was performed after the information was collected by the DAS (data acquisition system). At MIPS, the environmental assessment can be done by the simulation programs for cases of emergency and normal operation. DOE

SCIENCE SUPPORT FOR THE EARTH RADIATION BUDGET EXPERIMENT Final Report
James A. Coakley, Jr. 7 Mar. 1994 44 p
(Contract NAS1-18992; RTOP 665-45-20-01)
(NASA-CR-191600; NAS 1.26:191600) Avail: CASI HC A03/MF A01

The work undertaken as part of the Earth Radiation Budget Experiment (ERBE) included the following major components: The development and application of a new cloud retrieval scheme to assess errors in the radiative fluxes arising from errors in the ERBE identification of cloud conditions. The comparison of the anisotropy of reflected sunlight and emitted thermal radiation with the anisotropy predicted by the Angular Dependence Models (ADM's) used to obtain the radiative fluxes. Additional studies included the comparison of calculated longwave cloud-free radiances with those observed by the ERBE scanner and the use of ERBE scanner data to track the calibration of the shortwave channels of the Advanced Very High Resolution Radiometer (AVHRR). Major findings included: the misidentification of cloud conditions by the ERBE scene identification algorithm could cause 15 percent errors in the shortwave flux reflected by certain scene types. For regions containing mixtures of scene types, the errors were typically less than 5 percent, and the anisotropies of the shortwave and longwave radiances exhibited a spatial scale dependence which, because of the growth of the scanner field of view from nadir to limb, gave rise to a view zenith angle dependent bias in the radiative fluxes. Two models are described for calculating topographical effects on precipitation in complex terrain. One is a three dimensional variational model, and the other is a three dimensional initial value model. The initial value model is the best in principle since it incorporates the most physics, but it requires an accurately defined initial state and is computationally expensive. The variational model is comparatively simple and easy to compute. The three dimensional variational model is applied to calculate the precipitation for 11 Jul. 1983 in the upper Columbia River watershed in

southeastern British Columbia as an experiment. The experimental results strongly show that the model gives realistic results and that the initial wind velocities can be adjusted by different methods. Theoretically speaking, adjusting velocities by two functions is the best, but this result cannot be proven from these experiments since the functions were chosen randomly.

INVESTIGATION OF MESOSCALE CONVECTIVE CLOUD CLUSTERS IN SOUTH CHINA
Jixi Jiang, Huiming Ye, and Meizhen Chen 3 Nov. 1993 26 p Transl. into ENGLISH from Yingyong Qixiang Xuebao (China), v. 1, no. 3, Aug. 1990 p 232-241
(AD-A274303; FASTC-ID(RS)T-0369-93) Avail: CASI HC A03/MF A01

The statistical characteristics of 176 mesoscale convective cloud clusters in South China, which are classified into three types in terms of their size, are analyzed based on the short interval GMS images and conventional data during April-October, 1980-1988. Two composite model charts are presented for their formation and development, and two typical cases are studied. Some conclusions can be drawn as follow: (1) Mesoscale convective systems in South China; (2) The convergences of wind and moisture fields in the surface layer and orographic forcing are the trigger mechanism for the genesis of cloud clusters: and (3) Low-level jet and monsoon cloud swell are the most important factors for the development of cloud clusters.

(DE94-002359; PNL-SA-22559; CONF-930810-10) Avail: CASI HC A02/MF A01

Meteorological measurements are an integral and essential component of any emergency response system for addressing accidental releases from nuclear facilities. An important element of the US Department of Energy's (DOE's) Atmospheric Studies in Complex Terrain (ASCOT) program is the refinement and use of state-of-the-art meteorological instrumentation. ASCOT is currently making use of ground-based remote wind sensing instruments such as doppler acoustic sounders (sodars). These instruments are capable of continuously and reliably measuring winds up to several hundred meters above the ground, unattended. Two sodars are currently measuring the winds, as part of ASCOT's Front Range Study, in the vicinity of DOE's Rocky Flats Plant (RFP) near Boulder, Colorado. A brief description of ASCOT's ongoing Front Range Study is given followed by a case study analysis that demonstrates the utility of the meteorological measurement equipment and the complexity of flow phenomena that are experienced near RFP. These complex flow phenomena can significantly influence the transport of the released material and consequently need to be identified for accurate assessments of the consequences of a release.

SHORT-RANGE CLOUD AMOUNT FORECASTING WITH MODEL OUTPUT STATISTICS Final Report, Feb. 1992 - Sep. 1993
M. E. Cianciolo Sep. 1993 167 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-91-C-0185)
(AD-A274769; PL-TR-93-2205) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

TASC conducted a feasibility study of the utility of short-range (3-, 6-, and 9-hour) forecasts of total cloud amount and probability of cloud cover categories using the Model Output Statistics (MOS) approach. The MOS models were built using output from the Air Force Global Spectral Model (GSM) and the Real-Time NEPHanalysis (RTNEPH) model. The RTNEPH total cloud amount fields were also used as ground truth. Models were developed on the eighth-mesh RTNEPH grid (approximately 40 km resolution) for 71 data sets covering a range of locations (tropics and midlatitudes), seasons, and times of day. Results were compared with persistence forecasts using the Brier score, 20/20 score, and sharpness measure. The MOS-based forecasts outperformed persistence with respect to the overall reduction in mean square error, but forecast sharpness was sacrificed. Estimates for future model performance for total cloud cover and probabilities of cloud cover categories were determined for two sample cases. Considering the short data records used to develop the equations, the MOS-based forecast models were remarkably robust in most cases. Recommendations for model improvements and additional performance assessment included: using higher spatial resolution model data that better match the resolution of the eighth-mesh forecasts, using cloud layer variables in model development, developing regression coefficients using additional seasons of data, using non-linear models, and continuing model evaluation using independent cloud data. SURFACE ROUGHNESS LENGTHS Final Report
Frank V. Hansen Aug. 1993 34 p
(AD-A274550; ARL-TR-61) Avail: CASI HC A03/MF A01

The surface roughness length is the meteorological equivalent of an aerodynamic drag coefficient. The surface morphology and terrain relief contribute to the roughness, have a large effect upon surface drag, and influence the analysis of wind, temperature, and specific humidity profiles in the surface boundary layer, as well as the examination of the surface energy balance. Roughness lengths effectively determine the vertical wind shear just above the surface with atmospheric stability almost a direct function of shear and roughness. Experimentally, roughness lengths over many natural surfaces have been determined. Many summaries of estimated surface roughness have been prepared, with most listing only a few typical values. One comprehensive study tabulated all values according to the year the data were collected. In this current effort, an attempt has been made to list roughness as a function of five categories, that is, natural surfaces, including seasonal variations, agricultural lands, urban roughness, effective roughness, and land-use categories. PROPAGATION OF COLD AIR MASSES IN EAST ASIA AND ITS ASSOCIATED PLANETARY-SCALE FUNCTION
Yihui Ding 3 Nov. 1993 23 p Transl. into ENGLISH from Yingyong Qixiang Xuebao (China), v. 2, no. 2, May 1991 p 124-132
(AD-A274304; FASTC-ID(RS)T-0370-93) Avail: CASI HC A03/MF A01

The present paper has delt with the characteristics of propagation of the winter monsoon during cold air outbreaks for 19 cases of 1980-1984 in East Asia as well as the associated planetary-scale effect. It has been revealed that the propagation of cold air mainly shows a mode of 10-20 day period oscillation. Furthermore, the Siberian cold high associated with outbreaks of cold air may lead to the response of a chain of planetary-scale events. This mainly shows up in the fact that the branch of upward motion of the divergent circulation rapidly shifts from the Indonesia-Malaysian region eastward to the eastern Pacific, thus causing the normal-type Walker circulation to reverse its sense. This condition is very similar to the movement of divergent circulation from non-El Nino year to El Nino year. From the dynamic viewpoint, this kind of divergent circulation is favorable to the synoptic development over the eastern Pacific and the western coast of North America. DTIC

CLOUD LIQUID WATER CONTENT MEASUREMENT TESTS USING DUAL-WAVELENGTH RADAR Technical Memo
Brooks E. Martner, Robert A. Kropfli, L. Edward Ash (Colorado Univ., Boulder.), and Jack B. Snider Oct. 1993 53 p See also PB91-131839 and PB92-133800 Prepared in cooperation with Colorado Univ., Boulder
(PB94-125960; NOAA-TM-ERL-ETL-235) Avail: CASI HC A04/MF A01

The first field test of a dual-wavelength differential attenuation radar technique for providing range-resolved measurements of cloud liquid water content (LWC) was conducted in Colorado during and shortly after the 1991 Winter Icing and Storms Project (WISP91). A dual-wavelength system was improvised from existing radars of 3.2 cm and 0.87 cm wavelengths. The radar antennas were electronically slaved together and scanned in synchronization with each other and with a steerable microwave radiometer which was used for comparisons. The experiment had mixed results. LWC values computed by the radar technique for several cases during WISP91 were erratic and included negative values. These clouds were relatively dry, however, and did not provide a suitable sample for evaluating the technique's performance in the more hazardous aircraft icing conditions of high LWC. Radar measurements obtained alone shortly after the end of WISP91 yielded reasonable LWC values and patterns, but without independent data for verification. The analyses suggest the radar technique may work best for long path lengths through high-LWC clouds of small droplets that contain some moderately large ice crystals and for clouds containing large droplets up to drizzle sizes. METEOROLOGICAL DATA AT THE NAGAOKA INSTITUTE OF SNOW AND ICE STUDIES Report No. 1, Dec. 1981 - Apr. 1991 [NAGAOKA NI OKERU KISHO KANSOKU SHIRYO]
Masujiro Shimizu, Tadashi Kimura, and Masayoshi Nakao 30 Mar. 1993 68 p In JAPANESE
(ISSN 0917-057X)
(Rept-158; JTN-94-80511) Avail: CASI HC A04/MF A01

Meteorological data have been collected since March 1971 as an important basis for the snow and ice studies at the Nagaoka Institute of Snow and Ice Studies. It is located at 37 deg 25 min N, 138 deg 53 min E, and 7 cm above sea level in the south of the Echigo plain, the central portion of Japan's main island. This report contains the daily data of 10 winters from December 1981 to April 1991, on the following elements: barometric pressure, air temperature, soil temperatures, wind direction and speed, global solar radiation, radiation balance, duration of sunshine, and amount of precipitation. AN OBSERVATIONAL STUDY OF THE EXTRATROPICAL ANTICYCLONES IN THE SOUTH AMERICAN CONTINENT [UM ESTUDO OBSERVACIONAL DA FORMACAO E TRAJETORIAS DE ANTICICLONES EXTRATROPICAIS NA AMERICA DO SUL]
Luiz Claudio Ermida Lima Dec. 1991 91 p In PORTUGESE
(INPE-5387-TDI/476) Avail: CASI HC A05/MF A01

In this study, South American extratropical anticyclones have been studied in the period between 1979 and 1989 for the weak and moderate ones, and between 1953 and 1990 for the most intense ones (in which average pressure was greater or equal to 1030 hPa) by using daily synoptic charts. The main goal of this work was to show the tracks of the anticyclones and the regions where the first closed isobar appeared more frequently in the area between 15 deg S and 55 deg S over the South American Continent. Initially we estimated the number of days in which inner anticyclonic curved isobars crossed the 5x5 degrees areas. Then all tracks of the migratory anticyclones were followed by using daily surface charts. The highest pressure located in the interior of the anticyclones or ridges and temperature was interpolated. We concluded that orography plays an important role in the distribution of anticylonic isobars, with a higher number of days to the west of the Andes cordillera than to the east of the mountains. It was observed that the anticyclogenetic area for the moderate and weak ones is located in an area to the south of Paraguay and North Argentina, while the most intense ones have their first closed isobar in Central Argentina. The weak anticyclones follow a zonal track and the moderate or intense ones follow a path oriented in the SW-NE direction. Author

GLOBAL BAROTROPIC RESPONSE TO A TROPICAL FORCING
Yuxia Zhang and James P. McGuirk 1993 2 p Presented at the 9th AMS Conference on Atmospheric and Oceanic Waves and Stability, San Antonio, TX, May 1993
(Grant NAG8-912)
(NASA-CR-195256; NAS 1.26:195256) Avail: CASI HC A01/MF A01

Zonally varying flow has been used to initialize numerical models and has been shown to play an important role in strong localized responses both in extratropics and the tropics. In this study, a climatological 200 mb January mean is used as a steady basic state of a barotropical model which consists of shallow water equations and a mass source centered at 4 deg S/120 deg E to simulate convective heating over Indonesia region. In the experiment, tropical responses appear not only over the western Pacific, where the forcing is located, but also over the eastern Pacific where the response is related to the zonally varying basic state. The westward propagating equatorial Rossby waves excited by the forcing interact with waves out of and into the tropics and the positive and negative phase of the Rossby waves result in blocking circulation over North America and tropical plumes over equatorial eastern Pacific, respectively. A SYNOPTIC STUDY ON PERIODS OF DEFICIENCY OVER RIO GRANDE DO SUL/BRAZIL [ESTUDO SINOTICO DE PERIODOS DEFICIENTES DE CHUVAS NO RIO GRANDE DO SUL]
Humberto Conrado Feb. 1992 155 p In PORTUGESE
(INPE-5456-TDI/498) Avail: CASI HC A08/MF A02

The rainfall regime in the State of Rio Grande do Sul (Brazil) is characterized by a homogeneous monthly distribution and a low interannual variability. A spatial series considering 39 years of precipitation data (1952-1990) was used to analyze the years which had periods of rain deficiency. In the years 1988 and 1989 the annual precipitation presented meaningful negative deviation. Two summer seasons (January and February) which presented negative anomalous behavior during these years were selected. A synoptical study, using geopotential fields, vertical velocity, relative vorticity, vorticity advection, and divergence fields was performed to analyze this period of rain deficiency. The South Atlantic Convergence Zone (SACZ) was observed to persist during the February months which registered a significant negative deviation precipitation. Related to the SACZ, the presence of a trough was noticed over to the east of Rio Grande do Sul state. At the same time, a trough in the Pacific Ocean was found about 120 deg W. This atmospheric pattern showed to be stationary in February, suggesting effects similar to a blocking situation. As a result, the frontal systems were deviated from their usual path over the State of Rio Grande do Sul. The position of the trough axis, to the east of Rio Grande do Sul induced a persistent subsidence which contributed to inhibiting the convective activity over the region. This period with anomalous negative precipitation coincided with the presence of a positive Southern Oscillation Index in the Pacific Ocean. Author (revised)

SIMULATION OF THE INDIAN AND EAST-ASIAN SUMMER MONSOON IN THE ECMWF MODEL: SENSITIVITY TO HORIZONTAL RESOLUTION
K. R. Sperber, G. L. Potter, J. S. Boyle, and S. Hameed (State Univ. of New York, Stony Brook.) Nov. 1993 37 p
(Contract W-7405-eng-48)
(DE94-004276; UCRL-ID-115322; PCMDI-12) Avail: CASI HC A03/MF A01

The ability of the ECMWF model (Cycle 33) to simulate the Indian and East Asian summer monsoon is evaluated at four different horizontal resolutions: T21, T42, T63, and T106. Generally, with respect to the large scale features of the circulation, the largest differences among the simulations occur at T42 relative to T21. However, on regional scales, important differences among the high frequency temporal variability serve as a further critical test of the model's ability to simulate the monsoon. More generally, the results indicate the importance of evaluating high frequency time scales as a component of the climate system. T106 best captures both the spatial and temporal characteristics of the Indian and East Asian monsoon, while T42 fails to correctly simulate the sequence and development of synoptic scale milestones that characterize the monsoon flow. In particular, T106 is superior at simulating the development and migration of the monsoon trough over the Bay of Bengal. In the T42 simulation, the development of the monsoon occurs one month earlier than typically observed. At this time the trough is incorrectly located adjacent to the east coast of India which results in an underestimate of precipitation over the Burma/Thailand region. This early establishment of the monsoon trough affects the evolution of the East-Asian monsoon and yields excessive preseason rainfall over the Mei-yu region. EOF analysis of precipitation over China indicates that T106 best simulates the Mei-yu mode of variability associated with an oscillation of the rainband that gives rise to periods of enhanced rainfall over the Yangize River Valley. The coarse resolution of T21 precludes simulation of the aforementioned regional scale monsoon flows. DOE

The internal structure of thunderstorms occurring in Southern Germany is investigated using a polarization diversity Doppler radar (POLDIRAD). The discrimination of different kinds of hydrometeors such as raindrops, graupel or hail was possible by polarimetric measurements. Following the temporal evolution of the particles allows the basic processes involved in hail formation to be inferred, as exemplified by a case study. Based on these processes as well as on statistics of storm types and potential damage, an assessment was made on the probable effects of cloud seeding for hail prevention as performed operationally in the counties of Rosenheim and Miesbach. Considering a variety of possible factors of influence, cloud seeding turned out to have negligible influence on potential hail damages on the ground. In accordance with this finding, six year statistics of the regional distribution of the radar determined hailfalls does not show any effects attributable to cloud seeding. ESA

THOR is a knowledge-based system which incorporates techniques from signal processing, pattern recognition, and artificial intelligence (AI) in order to determine the boundary of small thunderstorms which develop and dissipate over the area encompassed by KSC and the Cape Canaveral Air Force Station. THOR interprets electric field mill data (derived from a network of electric field mills) by using heuristics and algorithms about thunderstorms that have been obtained from several domain specialists. THOR generates two forms of output: contour plots which visually describe the electric field activity over the network and a verbal interpretation of the activity. THOR uses signal processing and pattern recognition to detect signatures associated with noise or thunderstorm behavior in a near real time fashion from over 31 electrical field mills. THOR's AI component generates hypotheses identifying areas which are under a threat from storm activity, such as lightning. THOR runs on a VAX/VMS at the Kennedy Space Center. Its software is a coupling of C and FORTRAN programs, several signal processing packages, and an expert system development shell. Author (revised)

(DE94-004985; LA-UR-93-4265; CONF-9311135-4) Avail: CASI HC A02/MF A01

Lightning represents an event detectable optically, electrically, and acoustically, and several systems are already in place to monitor such activity. Unfortunately, such detection of lightning can occur too late, since operations need to be protected in advance of the first lightning strike. Additionally, the bolt itself can traverse several kilometers before striking the ground, leaving a large region of uncertainty as to the center of the storm and its possible strike regions. NASA Kennedy Space Center has in place an array of electric field mills that monitor the effectively DC electric field. Prior to the first lightning strike, the surface electric fields rise as the storm generator within a thundercloud begins charging. Extending methods developed for an analogous source localization problem in magnetoencephalography, Cramer-Rao lower bounds and MUSIC scans for fitting a point-charge source model to the electric field mill data are presented. Such techniques can allow for the identification and localization of charge centers in cloud structures. DOE

(NASA-TM-104599; NAS 1.15:104599; Rept-94B00055) Avail: CASI HC A03/MF A01

Calibration of the visible and near-infrared (near-IR) channels of the MODIS Airborne Simulator (MAS) is derived from observations of a calibrated light source. For the 1992 Atlantic Stratocumulus Transition Experiment (ASTEX) field deployment, the calibrated light source was the NASA Goddard 48-inch integrating hemisphere. Tests during the ASTEX deployment were conducted to calibrate the hemisphere and then the MAS. This report summarizes the ASTEX hemisphere calibration, and then describes how the MAS was calibrated from the hemisphere data. All MAS calibration measurements are presented and determination of the MAS calibration coefficients (raw counts to radiance conversion) is discussed. In addition, comparisons to an independent MAS calibration by Ames personnel using their 30-inch integrating sphere is discussed. Derived from text

MODIS AIRBORNE SIMULATOR VISIBLE AND NEAR-INFRARED CALIBRATION, 1991 FIRE-CIRRUS FIELD EXPERIMENT. CALIBRATION VERSION: FIRE KING 1.1
G. Thomas Arnold (Applied Research Corp., Landover, MD.), Michael Fitzgerald (Analytical Technology Applications Corp., Mountain View, CA.), Patrick S. Grant (Analytical Technology Applications Corp., Mountain View, CA.), and Michael D. King Mar. 1994 26 p

(RTOP 913-00-00)
(NASA-TM-104600; NAS 1.15:104600; Rept-94B00054) Avail: CASI HC A03/MF A01

Calibration of the visible and near-infrared channels of the MODIS Airborne Simulator (MAS) is derived from observations of a calibrated light source. For the 1991 FIRE-Cirrus field experiment, the calibrated light source was the NASA Goddard 48-inch integrating hemisphere. Laboratory tests during the FIRE Cirrus field experiment were conducted to calibrate the hemisphere and from the hemisphere to the MAS. The purpose of this report is to summarize the FIRE-Cirrus hemisphere calibration, and then describe how the MAS was calibrated from observations of the hemisphere data. All MAS calibration measurements are presented, and determination of the MAS calibration coefficients (raw counts to radiance conversion) is discussed. Thermal sensitivity of the MAS visible and near-infrared calibration is also discussed. Typically, the MAS in-flight is 30 to 60 degrees C colder than the room temperature laboratory calibration. Results from in-flight temperature measurements and tests of the MAS in a cold chamber are given, and from these, equations are derived to adjust the MAS in-flight data to what the value would be at laboratory conditions. For FIRE-Cirrus data, only channels 3 through 6 were found to be temperature sensitive. The final section of this report describes comparisons to an independent MAS (room temperature) calibration by Ames personnel using their 30-inch integrating sphere. Author

AN ENHANCED GLOBAL SPECTRAL MODEL Final Report, Sep. 1989 - Nov. 1991

Thomas Nehrkorn, Ross Hoffman, Jean-Francois Louis, and Marina Zivkovic 27 Feb. 1992 85 p
(Contract F19628-89-C-0112)
(PL-TR-92-2011) Avail: CASI HC A05/MF A01

This report describes the development of a vectorized, multiprocessing global spectral model (GSM) with enhanced physical parameterizations. The starting point was the Phillips Laboratory GSM, in its GL90 version, which contained an enhanced suite of physical parameterizations. The latitude tasking scheme for multiprocessing the loop over latitude in the calculation of the spectral tendencies and adjusted model variables was implemented, using the general truncation version of the hydrodynamics code. Wavenumber calculations were vectorized over wavenumber and multiprocessed over vertical level. All grid point calculations were vectorized over longitude, and the physics packages were brought into closer compliance with plug-compatibility rules. Speedups due to the optimization were demonstrated in single- and multiprocessing timing tests on a dedicated Cray 2 and Cray Y-MP. The enhanced physics GSM was evaluated in forecast tests and contrasted with the simpler physics GSM used at GWC. Minimization of errors in the computation of the horizontal pressure gradient force was investigated using a perturbation temperature instead of full temperature in the integration of the hydrostatic equation. Several schemes were tested in an idealized model atmosphere. Author (revised)

A STUDY ON STRUCTURE OF BENTHIC BOUNDARY LAYER IN COASTAL WATERS [ENGAN KAIIKI NI OKERU KAITEI KYOKAISO NO KOZO NI KANSURU KENKYU]

Eichi Sumi 25 Feb. 1993 121 p In JAPANESE
(ISSN 0916-9989)
(Rept-4; JTN-94-80512) Avail: CASI HC A06/MF A02

A three dimensional ultrasonic current meter capable of measuring turbulent characteristics was developed and used to study the turbulent structure of the benthic boundary layer. The results obtained by the system are as follows: (1) the current system of coastal waters is the same as other natural current systems and originally has a three dimensional structure; and (2) it is demonstrated that the turbulent structure near the sea bottom is distributed in the turbulent level. A tidal flow was considered to be a field of the unsteady flow study and many unsteady phenomena were studied. The study results are as follows: (1) nearly 10 minutes were required for the assumption of quasi-steadiness to be established and the friction velocity could be measured with extreme precision at the sampling time of 3 minutes; and (2) the results of studying the temporal similarities and hysteresis effects of the turbulent structure of tidal flow near the sea bottom showed that the turbulent characteristics change with respect to the average horizontal flow velocity. The similarities between the benthic boundary layer and the atmospheric boundary layer were studied, and the study results were as follows: (1) in coastal waters which include shallow waters, it was shown that the friction velocity, not the Reynold's stress, decreases linearly with respect to the height and that the Reynold's stress had a nonlinear distribution; and (2) the vertical eddy viscosity coefficient in shallow waters was estimated from the results of field tests on various assumptions. SIMULATION OF THE CARBON CYCLE IN THE OCEANS

U. Siegenthaler 1993 4 p
(Contract DE-FG02-90ER-61054)
(DE94-000780; DOE/ER-61054/3) Avail: CASI HC A01/MF A01

In this report, the authors conclude that the average oceanic uptake of anthropogenic CO2, as determined from four different ocean models and normalized to the observed mean penetration depth of bomb-C-14 (analogue to anthropogenic CO2), is 2.0 +/- 0.5 GtC/yr (decade 1980-1989). This oceanic uptake plus the year-to-year growth of the atmospheric CO2 content together are less by 1.8 +/- 1.2 GtC/yr than the estimated anthropogenic CO2 emissions from fossil fuels and land use. INTERPRETING THE IMPLIED MERIDIONAL OCEANIC ENERGY TRANSPORT IN AMIP

D. A. Randall (Colorado State Univ., Fort Collins.) and P. J. Gleckler Sep. 1993 4 p Presented at the 74th American Meteorological Society Annual Meeting, Nashville, TN, 23-28 Jan. 1994
(Contract W-7405-eng-48)
(DE94-001538; UCRL-JC-114683; CONF-940115-8) Avail: CASI HC A01/MF A01

The Atmospheric Model Intercomparison Project (AMIP) was outlined in Paper No. CLIM VAR 2.3 (entitled 'The validation of ocean surface heat fluxes in AMIP') of these proceedings. Preliminary results of AMIP subproject No. 5 were also summarized. In particular, zonally averaged ocean surface heat fluxes resulting from various AMIP simulations were intercompared, and to the extent possible they were validated with uncertainties in observationally-based estimates of surface heat fluxes. The intercomparison is continued in this paper by examining the Oceanic Meridional Energy Transport (OMET) implied by the net surface heat fluxes of the AMIP simulations. As with the surface heat fluxes, the perspective here will be very cursory. The annual mean implied ocean heat transport can be estimated by integrating the zonally averaged net ocean surface heat flux, N(sub sfc), from one pole to the other. In AGCM simulations (and perhaps reality), the global mean N(sub sfc) is typically not in exact balance when averaged over one or more years. Because of this, an important assumption must be made about changes in the distribution of energy in the oceans. Otherwise, the integration will yield a non-zero transport at the endpoint of integration (pole) which is not physically realistic. Here the authors will only look at 10-year means of the AMIP runs, and for simplicity they assume that any long term imbalance in the global averaged N(sub sfc) will be sequestered (or released) over the global ocean. Tests have demonstrated that the treatment of how the global average energy imbalance is assumed to be distributed is important, especially when the long term imbalances are in excess of 10 W m(exp -2). However, this has not had a substantial impact on the qualitative features of the implied heat transport of the AMIP simulations examined thus far. DOE

HYDROGRAPHIC AND ACOUSTIC DOPPLER CURRENT PROFILER (ADCP) DATA FROM THE ONR EASTERN BOUNDARY CURRENT

ACCELERATED RESEARCH INITIATIVE, 9-16 JUNE 1992
Paul F. Jessen and Steven R. Ramp Nov. 1993 157 p
(AD-A274115; NPS-OC-93-006) Avail: CASI HC A08/MF A02

This data report presents hydrographic (CTD) and Acoustic Doppler Current Profiler (ADCP) data from a cruise to the continental slope region near Point Arena, CA during 9-16 Jun. 1992. The study area encompassed a region from about 38 deg 0.0 min N to 39 deg 0.0 min N from 20 to 90 km offshore. The sampling grid consisted of five along-shore transects 15 km apart, with five CTD stations 15 km apart in each transect. A total of 28 CTD casts were made. ADCP data were collected throughout the cruise. The data are presented as vertical sections, property distributions on horizontal surfaces, and waterfall plots. DTIC

CORRELATION BETWEEN THE GRAVITY FIELD AND THE BATHYMETRY IN THE NORTH ATLANTIC OCEAN Thesis [CORRELATIE TUSSEN HET ZWAARTEKRACHTVELD EN DE BATHYMETRIE IN DE NOORDATLANTISCHE OCEAAN]
Baptist Welting Jun. 1992 92 p In DUTCH
(ETN-94-95036) Avail: CASI HC A05/MF A01

The correlation between the gravity field and the topography/bathymetry in a limited regional area is addressed. The gravity implied by the mass distribution inside the Earth is described by Newton's law of gravity. The Newtonian integral is evaluated in two steps. The influence of the long wave topography is calculated, and the influence of the residual topography is examined. The North Atlantic Ocean is chosen as a test area. For the calculation of the gravity implied by the residual topography, the Newtonian integral is expressed as a convolution integral in terms of the Fourier theory. This convolution integral is evaluated using fast Fourier techniques. The correlation analysis shows that the long wavelength gravity agrees perfectly with an isostatic compensated topography model. The short wave gravity field correlates almost directly with the topography itself. The method is concluded to be convenient to model the gravity influence of the local topography. Only the Airy-Heiskanen model is used to describe the topography and its isostatic compensation. It will be interesting to investigate whether it is possible to expand the derived model, using Fourier techniques, for more complex topography/isostasy models, which are expected to provide even more realistic results for the local influence. COUPLING OF PELAGIC AND BENTHIC COMMUNITIES OVER A SEAMOUNT IN THE EASTERN NORTH PACIFIC Final Report, 1 Oct. 1988 - 30 Sep. 1993
Kenneth L. Smith, Jr. 1994 9 p
(Contract N00014-89-J-1540)
(AD-A274750) Avail: CASI HC A02/MF A01

Recent studies indicate that seamounts can be sites of enriched biological activity with enhanced biomass of pelagic and benthic organisms relative to the surrounding water. We undertook a study to examine the interaction of micronekton/nekton and benthopelagic animals/epibenthic megafauna over a deep oceanic seamount, Fieberling Guyot, located in the eastern North Pacific. We monitored the number and movements of acoustically detectable targets within the bottom 100 m of the water column over the summit using a vertically-profiling acoustic array developed for this study. A large multiple opening-closing net system (10 sq m) and free-vehicle baited traps were used to collect the pelagic fauna for identification, sizing and gut content analysis. A total of 26 acoustic targets were detected, dispersed non-randomly with a skewed distribution between 65 and 85 m above bottom. Temporal distribution of targets was random but revealed higher numbers in the morning than in the evening. The micronekton/nekton consisted of 114 species which were gravimetrically dominated by fish, especially the macrourid, Malacocephalus laevis. Four species of benthopelagic animals/epibenthic megafauna were collected including a new macrourid species, Nezumia n.sp. There are no strong trends in the diel distribution of the micronekton/nekton and the limited data on acoustic targets shows a random temporal distribution. Alternative explanations of trophic coupling over Fieberling Guyot are discussed.

TOPICS IN LONGSHORE CURRENTS Ph.D. Thesis
John C. Church Sep. 1993 130 p
(AD-A274788) Avail: CASI HC A07/MF A02

The momentum equation governing mean longshore currents on straight beaches is a balance of forcing from the momentum transfer of the oscillatory wave motion, turbulent momentum transfer (mixing), and bottom stress. Of these, the wave's contribution is well understood, but the remaining two are not, principally due to the complicated hydrodynamics of the surf-zone. Addressing the bottom stress term, a longshore current model is developed which includes a modification of the bottom stress due to the effects of breaking-wave induced turbulence. A one-dimensional turbulent kinetic energy equation is used to model this breaking-wave induced turbulence, producing a spatially varying bottom friction coefficient. The modeled longshore current cross-shore profiles show improved agreement with field observations. In a second bottom stress study, vertical profiles of mean longshore currents are examined using field data obtained with vertically stacked electromagnetic current meters with the goal of measuring the bottom stress and its associated drag coefficient. The profiles are observed to become vertically uniform whenever the ratio of wave height to depth exceeds 0.3, indicating that nearly all of the waves passing a given location are breaking. Finally, horizontal turbulent momentum transfer (mixing) is examined for the case of shear instabilities of the longshore current.

THE HOUGH TRANSFORM ALGORITHM FOR SEA ICE LEAD ANALYSIS: AN EVALUATION Final Report
Denise J. Gineris and Florence M. Fetterer 15 Nov. 1993 32 p
(AD-A274535; NRL-MR/7240-93-7072) Avail: CASI HC A03/MF A01

An algorithm for sea ice lead analysis using a Hough transform technique has been developed at the Naval Research Laboratory (NRL) Remote Sensing Applications Branch and is currently in use at NRL and the Navy/National Oceanic and Atmospheric Administration (NOAA) Joint Ice Center (JIC). The algorithm resides on a Sun microcomputer system as part of a larger image processing package (the NRL Satellite Image Processing System or NSIPS) developed at NRL. Currently, the algorithm functions on Advanced Very High Resolution Radiometer (AVHRR) and Operational Line Scan imagery. Algorithm performance was evaluated by comparing results from the Hough transform technique to those obtained through manual analysis for a set of five AVHRR infrared images. The algorithm operated well, but there is still room for improvement. Details of the evaluation and recommendations for improvement are contained in this report. DTIC

Detailed measurements of internal properties of Arctic ice were made in Spring 1990 to relate acoustic properties to the physical properties of the ice. This report presents the procedures, analyses, and results of those studies. Some basic parameters measured in previous field studies were remeasured; consistency between individual experiments strengthens our confidence in the results and the techniques used. Novel techniques were used to measure properties of growing ice, which was later cored, submerged, and remeasured. Results reported here have been summarized in the open literature. The basic data and their processing are described here in detail. In the ice-growth and submergence study, a 2-m-square hole was cut through the ice canopy. Strings of hydrophones and thermistors were then suspended vertically in the hole, and the water froze around them. Frequent monitoring of ice temperature and the receipt of sound pulses from below, along with salinities determined from ice cores obtained a short distance away, gave insight into the freezing process and the formation of a skeletal layer above the ice/water interface. Periodic measurements of the reflectivity of the growing ice at 37-150 kHz gave further information on the skeletal structure. The sound speed in the skeletal layer varied from that of the water at the ice/water interface to that of bulk ice at about 3 cm into the ice. Absorption of sound (in decibels per meter) was about three times greater near the interface, decreasing to that for bulk ice at 15-20 cm into the ice. DTIC

THE NOGAPS TEN YEAR AMIP INTEGRATION Final Report
Thomas E. Rosmond Oct. 1993 60 p
(DA Proj. 7W0-513)
(AD-A274332; NRL/MR/7532-93-7212) Avail: CASI HC A04/MF A01

This report is a user's guide to the 10 year model history data set from an integration of the Navy Operational Global Atmospheric Prediction System (NOGAPS). NRL Monterey is participating in the Atmospheric Model Intercomparison Project (AMIP) sponsored by the Department of Energy. Nearly every major atmospheric modeling center in the world has run their model for the years 1979 through 1988 with sea surface temperature and sea ice boundary conditions provided by AMIP. The NOGAPS AMIP data set has great potential for use in a wide variety of atmosphere/ocean studies that require the high time and space resolution available from a global atmospheric model. DTIC

COMPILATION OF CORRECTIONS FOR POSTPROCESSING OF LASER BATHYMETRY DATA [SAMMANSTAELLNING AV KORREKTIONER FOER EFTERBEHANDLING AV LASERBATYMETRIDATA]
O. Steinvall, K. Koppari, and U. Karlsson May 1993 41 p In SWAHILI
(PB94-123668; FOA-30079-3.1) Avail: Issuing Activity (National Technical Information Service (NTIS))

The report shortly reviews the most important corrections which have to be applied in the post-processing of the raw data from a laser bathymetry system. These corrections include absolute positioning of the depth sounding as well as corrections for the measured depth. The depth corrections consist of system dependent parameters as well as environmental factors such as the influence of waves and multiple scattering in the water. Many of the corrections are hard to apply with great accuracy, e.g. those corrections which depend on wave slopes as these slopes are hard to measure. An analysis of the total error budget indicates that a depth sounding laser system during most weather and water conditions can meet the demand on depth accuracy set by the International Hydrographic Bureau (IHB) as being no larger than + or - 30 cm down to 30 m depth and no larger than 1 m down to 100 m depth. (PB94-124443; FOA-C-30707-3.1) Avail: Issuing Activity (National Technical Information Service (NTIS))

The report describes the development of a program called ScanView. The program is supposed to simplify the postprocessing of water depth data collected with the FLASH-system. ScanView consists of a number of windows and dialogs that present swath and echos graphicly. With the program one can study collected bathymetry data as a color scaled map describing depth of water. Various settings can be made to make out interesting shots. The individual laser shots may then be selected and studied for instance by its waveform. The program is written in the programming language Ada with help of the window system Motif. NTIS

PROCEEDINGS OF THE SYMPOSIUM ON CURRENT CONCEPTS AND APPROACHES ON ANIMAL TEST ALTERNATIVES Final Report, period ending Feb. 1992
Harry Salem, comp. Sep. 1993 407 p
(DA Proj. 101-62622-A-553)
(AD-A273926; ERDEC-SP-012) Avail: CASI HC A18/MF A04

Biological and medical research has historically been conducted primarily with animal experimentation. The advances in biological scientific knowledge and medicine have been dependent and resulted from these animal experiments, supplemented with in vitro studies. Over the last decade, advocates for animal rights, and the skyrocketing cost of animal experimentation, have intensified the search for more alternatives to animal biomedical research and testing. Although to replace animal research is a noble quest, realistically this may never be accomplished since the final proof will require testing in an integrated whole animal system. However, the scientific and animal activist communities, sensitive to all of these issues, are advocating the adoption of three goals: replacement of animals, reduction in the number of animals, and refinement by getting more information from fewer animals and using animals lower on the phylogenetic tree. A fourth task is taking responsibility for implementation. These proceedings describe the current state of the art in these approaches. Alternative methods (in vitro, chemical, computer) are described for not only eye and skin, but also for inhalation, aquatic, environmental and noncarcinogenic endpoints. In addition, the regulatory status is discussed since this is a major prerequisite to validation and acceptance. DTIC

AN AUTOMATIC 14-DAY PASTE DIET FEEDER FOR ANIMALS

Marilyn Vasques, Jerry Mulenburg, Dan Gundo, and Jon Griffith (Bionetics Corp., Moffett Field, CA.) Jan. 1994 13 p
(RTOP 199-08-12-06)
(NASA-TM-108804; A-94037; NAS 1.15:108804) Avail: CASI HC A03/MF A01

During a centrifuge experiment, any interruption that requires stopping the centrifuge may influence the results. Centrifuges often must be stopped for animal maintenance (food, water and waste removal), especially in cases of timed feedings. To eliminate the need for stopping the centrifuge while still providing timed feeding, an automatic paste diet feeder was developed. The feeder is based on a constant volume concept and can deliver a predetermined amount of paste diet at specified time intervals. This unit was supported by water delivery and waste collection systems. The entire system performed reliably and maintained the animals well for a continuous centrifugation experiment of 14 days. PLASMA VOLUME SHIFTS AND EXERCISE THERMOREGULATION WITH WATER IMMERSION AND SIX-DEGREE HEAD-DOWN TILT

Andrew Carl Ertl Jan. 1994 32 p
(Grant NGT-50686; RTOP 199-18-12-07)
(NASA-TM-108781; A-93097; NAS 1.15:108781) Avail: CASI HC A03/MF A01

The hypothesized fluid shifts and resultant responses that occur during spaceflight are simulated by six-degree head down tilt (HDT) and water immersion (WI). The purpose of this study was to compare exercise thermoregulation before and after physiologic mechanisms reduce plasma volume (PV) in response to 24-hr HDT (HDT24). A secondary study utilized WI to reproduce the PV reduction of HDT24. Seven males were studied in two conditions: during 70 minutes of supine cycling ergometry at 58 percent of peak oxygen consumption following 1-hr HDT (HDT1) and HDT24; and up to 6 hr WI at 34.5 C. Plasma volume was reduced by 10.4 percent in HDT24 when compared to HDT1. Pre-exercise rectal temperature, T(sub re), was an average 0.22 C higher after HDT24. Rectal temperature increased during exercise with no interaction between time and treatment. The reduced PV and elevated pre-exercise T(sub re) had offsetting effects on thermoregulatory mechanisms, suggesting no alteration in the response at a given T(sub re). Plasma volume was reduced by 4.3 +/- 2.3 percent and 1.1 +/- 1.8 percent following HDT24 and WI, respectively, compared to upright chair rest. Although the reductions in PV were not significantly different, great intra-individual variability was evident. The ability to reproduce PV changes consistently with HDT and WI is limited by this variability. Author (revised)

THERMOREGULATORY EFFECTS OF CAFFEINE INGESTION DURING REST AND EXERCISE IN MEN

Nancy Dunagan, John E. Greenleaf, and Craig J. Cisar Jan. 1994 47 p
(RTOP 199-18-12-07)
(NASA-TM-108783; A-93099; NAS 1.15:108783) Avail: CASI HC A03/MF A01

Body temperatures and thermoregulatory responses were measured at rest and during submaximal exercise under normal ambient conditions in 11 aerobically-conditioned men (age = 29.2 +/- 6.2 yr, VO2(max) = 3.73 +/- 0.46 min(sup -1), relative body fat = 12.3 +/- 3.7 percent, mean +/- SD) with (CT) and without (NCT) the ingestion of 10 mg of caffeine per kg of body weight. Oxygen uptake (VO2), heart rate (HR), and rectal (T(sub re)) and mean skin (T-bar(sub sk)) temperatures were recorded for 100 minutes starting one minute after ingestion of caffeine or a placebo. Data were collected throughout 30 minutes of rest (sitting) and the following 70 minutes of sitting leg ergometer exercise using the same constant load (1,088 +/- 153 kgm/min) in both NCT and CT. The load resulted in a mean relative exercise intensity equal to approximately 68 percent of VO2(sub max). Skin heat conductance (H(sub sk)) and sweat rate were calculated. Two-way analysis of covariance revealed no significant (P greater than 0.05) differences between NCT and CT in VO2, HR, T(sub re), T-bar(sub sk), or H(sub sk). A dependent t-test indicated no significant difference between NCT and CT in sweat rate. Thus, a high level of caffeine ingestion has no detrimental effects on body temperatures and thermoregulatory responses during moderately heavy exercise in normal ambient conditions. STUDIES ON THE APPLICATION OF RADIATION FOR GENETIC TRANSFORMATION IN HIGHER PLANTS

Young Il Lee, Hi Sup Song, Jae Sung Kim, In Chul Shin, Sang Jae Lee, Ki Woon Lee, and Yong Tack Lim Feb. 1993 70 p In KOREAN
Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-632656; KAERI/RR-1214/92) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

The present research discusses the use of radiation in genetic engineering to increase productivity. Some variants were selected from the M2 generation of Namzack and the M3 generation of Sumi. The variants were derived from the plantlet of the microtuber culture of two potato cultivars irradiated with gamma rays. The rate of variation in the irradiated microtuber indicated that there were very few differences among the cultivars. The optimum gamma ray dosage for inducing mutations was found to be in the range of 30-50 Gy of gamma rays. DOE

THE ROLE OF HYPERBARIC OXYGEN AS A PROPHYLAXIS FOR RADIATION ENTERITIS Final Report, 15 Feb. 1992 - 14 Feb. 1993

John J. Feldmeier 14 Feb. 1993 6 p
(Contract F49620-92-J-0183)
(AD-A274974; AFOSR-94-0016TR) Avail: CASI HC A02/MF A01

C3H mice were used to study the effects of post radiation treatments of hyperbaric oxygen (HBO) on preventing onset of radiation enteritis. Fifty mice were irradiated in the abdominal pelvic regions with identical radiation doses of 3000 CGY in 10 fractions over two weeks. The mice were randomly divided into a control and a study group of 25 each. The control group received no other treatment while being maintained with standard nutritional support. The study group preceived 30 HBO treatments (90 min of 100% oxygen at 2.4 ATA for 5 days/week for 6 weeks) starting 7 weeks after radiation therapy. All mice were sacrificed at 7 months and examined for signs of radiation damage. A numerical scoring system was used to quantitatively evaluate radiation damage to tissue. A score of +30 was determined for the radiation control group consisting of 21 surviving animals while a score of only +3 was noted for the HBO treated study group consisting of 25 surviving animals. Stretch meter examination showed that 7 of 21 control animals possessed stenotic lesions while only 4 of 25 HBO-treated animals were affected. Histological examination for submucosal fibrosis is presently in progress with no apparent differences noted thus far. This study indicates that post-radiation HBO treatments can significantly reduce small bowel radiation damage in mice. DTIC

NEUTRON AND X RAY SCATTERING STUDIES OF THE INTERACTIONS BETWEEN Ca(2+)-BINDING PROTEINS AND THEIR REGULATORY TARGETS: COMPARISONS OF TROPONIN C AND CALMODULIN

J. Trewhella and G. A. Olah 1993 15 p Presented at the 4th International Conference on Biophysics and Synchrotron Radiation, Tsukuba, Japan, 30 Aug. - 5 Sep. 1992
(Contract W-7405-eng-36)
(DE94-002706; LA-UR-93-3851; CONF-920821-4) Avail: CASI HC A03/MF A01

The regulatory proteins calmodulin and troponin C share a strikingly unusual overall structure. Their crystal structures show each protein consists of two structurally homologous globular domains connected by an extended, solvent exposed alpha-helix of approximately eight turns. Calmodulin regulates a variety of enzymes that show remarkable functional and structural diversity. This diversity extends to the amino acid sequences of the calmodulin-binding domains in the target enzymes. In contrast with calodulin, troponin C appears to have a single very specialized function. It is an integral part of the troponin complex, and Ca(2+) binding to troponin c results in the release of the inhibitory function of troponin I, which eventually leads to actin-binding to myosin and the triggering of muscle contraction. Small-angle scattering has been particularly useful for studying the dumbbell shaped proteins because the technique is very sensitive to changes in the relative dispositions of the two globular domains. Small-angle scattering, using x rays or neutrons, gives information on the overall shapes of proteins in solution. Small-angle scattering studies of calmodulin and its complexes with calmodulin-binding domains from various target enzymes have played an important role in understanding the functional role of its unusual solvent exposed helix. Likewise, small-angle scattering has been used to study troponin C with various peptides, to shed light on the similarities and differences between calmodulin and troponin C. DOE

PERFORMANCE RECOVERY IN THE BABOON FOLLOWING (+)G SUB z-INDUCED LOSS OF CONSCIOUSNESS Final Report, Jul. 1985 - Sep. 1990

John W. Burns, Paul M. Werchan, John W. Fanton, and Andrew B. Dollins Dec. 1993 17 p
(AF Proj. 7930)
(AD-A274411; AL/CF-TR-1993-0110) Avail: CASI HC A03/MF A01

Seven male baboons (avg. wt. 20.6 +/- 1.6 kg) were trained in a simple shock-avoidance performance task on the Armstrong Laboratory human/animal centrifuge for subsequent (+)G sub z-induced loss of consciousness (G-LOC) exposure. A red light was presented to the baboon at approximate 2-s intervals. The animal was allowed 1 s to turn off the light or receive a 1-s shock. The shock could be abbreviated by a late trigger pull (escape). Thus, the animal could avoid, escape, or accept the full shock. EEG was monitored from three transcranial stainless steel electrodes. Loss of consciousness (LOC) was induced by a rapid onset (4 or 6 G/s) exposure to 8 (+)G sub z, (head-to-feet inertial load), and sustained until LOC was identified by a near isoelectric EEG signal. Performance recovery time was measured from the return of EEG activity to the time when the animal resumed the performance task. These data were compared with previously obtained human data and found to be very similar. Also, it was found that performance recovery time significantly (p less than .001) increased with increased duration of unconsciousness. This study demonstrates the utility of the baboon as an animal model for G-LOC research. DTIC

Toxins from pathogenic bacteria have been studied for the last century and have remained objects for intense research over the last decade. The power of gene technology has been used to increase the understanding of structure and mechanism of action of bacterial toxins. This review describes what is known for some of the most potent bacterial toxins. Aspects that are discussed are production of toxins in different systems, the use of toxins as new therapeutic agents and vaccines, and methods for identification of toxins. NTIS

NCVS, VOLUME 5 Status and Progress Report, Nov. 1993

Ingo Titze, ed., Julie Lenke, ed., Julie Ostrem, ed., and Martin Milder, ed. Nov. 1993 106 p Sponsored by National Inst. on Deafness and Other Communication Disorders Prepared in cooperation with Denver Center for the Performing Arts, CO; Wisconsin Univ., Madison; and Utah Univ., Salt Lake City
(AD-A274975) Avail: CASI HC A06/MF A02

This 5th Status and Progress Report comes at a time when we are all thinking of the long term future of the National Center for Voice and Speech. Many things are changing right now in the health science arena. All of us are familiar, of course, with the day to day developments of President Clinton's health care package. One thing is certain - each year we have to become more clever as researchers. The Advisory Board to NIDCD wishes us to get deeper into the molecular structure of all the organs of the human body involved in speech communication. At the same time, they wish us to understand the whole body as a system. Yet it is becoming more and more difficult to do invasive procedures, either on humans or on animals. This means that the critical data that we all need have to come from very carefully conducted experiments, those that have a high benefit to risk (or cost) ratio. On the one hand, we need large numbers of human subjects or animals to make our results statistically reliable; on the other hand, we need to conserve and protect humans and animals involved in research. This puts all of the pressure on the experimenter to obtain only those pieces of information that are absolutely vital and then to integrate the fragments in the most clever ways. DTIC

Proprioception, the reception of stimuli within the body that indicates position, is an important mechanism for optimal human performance. People exposed to prolonged bed rest, microgravity, or other deconditioning situations usually experience reduced proprioceptor and kinesthetic stimuli that compromise body balance, posture, and equilibrium. A new proprioceptive test is described that utilizes the computer-driven LIDO isokinetic ergometer. An overview of the computer logic, software, and testing procedure for this proprioceptive test, which can be performed with the arms or legs, is described. Author

EFFECT OF CARBON DIOXIDE ENRICHMENT ON RADISH PRODUCTION USING NUTRIENT FILM TECHNIQUE (NFT)

C. L. Mackowiak (Bionetics Corp., Cocoa Beach, FL.), L. M. Ruffe (Bionetics Corp., Cocoa Beach, FL.), N. C. Yorio (Bionetics Corp., Cocoa Beach, FL.), and R. M. Wheeler (Bionetics Corp., Cocoa Beach, FL.) Mar. 1994 17 p
(NASA-TM-107198; NAS 1.15:107198) Avail: CASI HC A03/MF A01

Radish plants (Raphanus sativus L. cvs. Cherry Belle, Giant White Globe, and Early Scarlet Globe) were grown in four different CO2 enriched environments, 0.04, 0.10, 0.50, and 1.00 kPa (400, 1000, 5000, 10000 ppm). Cultivar responses to CO2 treatments varied, where cv. Cherry Belle showed no significant response to CO2 enrichment, cv. Giant White Globe was moderately affected and Early Scarlet Globe was strongly affected. Enrichment at 0.10 kPa led to greater root dry matter (DM) than 1.00 kPa for cv. Giant White Glove, whereas 0.10 kPa produced greater storage root, shoot, and root DM than 1.00 kPa for cv. Early Scarlet Globe. The data suggest that 1.00 kPa CO2 may be detrimental to the growth of certain radish cultivars. Root:shoot ratios tended to increase with increasing CO2 concentration. Water use efficiency (g biomass/kg H2O) increased with increasing CO2 enrichment, up to 0.5 kPa but then declined at the 1.00 kPa treatment. The total nitric acid used to maintain nutrient solution pH was lowest at the 1.00 kPa treatment as well, suggesting a decreased demand of nutrients by the plants at the highest CO2 level. Author

DEVELOPMENT OF A SPARGING TECHNIQUE FOR VOLATILE EMISSIONS FROM POTATO (SOLANUM TUBEROSUM)
Elizabeth Berdis (Bionetics Corp., Cocoa Beach, FL.), Barbara Vieux Peterson (Bionetics Corp., Cocoa Beach, FL.), Neil C. Yorio (Bionetics Corp., Cocoa Beach, FL.), Jennifer Batten (Bionetics Corp., Cocoa Beach, FL.), and Raymond M. Wheeler 8 Dec. 1993 23 p
(Contract NAS10-11624)
(NASA-TM-109199; NAS 1.15:109199) Avail: CASI HC A03/MF A01

Accumulation of volatile emissions from plants grown in tightly closed growth chambers may have allelopathic or phytotoxic properties. Whole air analysis of a closed chamber includes both biotic and abiotic volatile emissions. A method for characterization and quantification of biogenic emissions solely from plantlets was developed to investigate this complex mixture of volatile organic compounds. Volatile organic compounds from potato (Solanum tuberosum L. cv. Norland) were isolated, separated and identified using an in-line configuration consisting of a purge and trap concentrator with sparging vessels coupled to a GC/MS system. Analyses identified plant volatile compounds: transcaryophyllene, alpha-humulene, thiobismethane, hexanal, cis-3-hexen-1-ol, and cis-3-hexenyl acetate. Author

The space experiment KINETICS onboard of the Spacelab mission IML-2 (International Microgravity Laboratory) deals with cellular repair processes of radiation injured DNA (Deoxyribo Nucleic Acid) in microgravity. The biological samples consist of irradiated cultures of bacteria and human cells in nine Typ-1-containers of the Biorack. They are kept frozen except for the active phase in the 37 C incubator. The experiment hardware comprises nine sample carriers and three passive thermal units to keep the samples frozen during the first 30 h of the mission. The sample carriers are constructed from rectangular aluminum profiles with holes to accommodate eighteen 200 micrometers tubes with bacteria and ten 600 micrometers tubes with cell cultures, each. The passive thermal units are stainless steel vacuum flasks. Their interior is divided into an inner part, accommodating three sample carriers, and an outer part with phase changing material. A total of 550 ml of a water salt solution as phase changing material will keep the samples frozen for 42 h. ESA

(DLR-FB-93-26; ETN-94-95502) Avail: CASI HC A06/MF A02

On Escherichia coli plasmid pUC19 the UV action spectra of inactivation, mutation induction and strand break induction are compared between wet and dry state. The cross sections of inactivation and mutation induction show similar dependence on wavelength strand in the range 190 to 254 nm, whereas the cross sections of inactivation and break induction show similar dependence on wavelength in the range 160 to 190 nm. The mutation spectrum was detected after irradiation with V-UV (Vacuum UV) (160 nm) and V-UV (254 nm). In both cases, more than 60 of the detected mutations were transitions. After irradiation with V-UV (254 nm) a significant amount of frame-shift mutations could be detected. ESA

NEUTRONS IN BIOLOGY
Satoru Funahashi (Japan Atomic Energy Research Inst., Tokai.) and Nobuo Niimura (Toho Univ., Tokyo, Japan.) Jan. 1993 104 p
(DE94-701085; JAERI-M-92-213) Avail: CASI HC A06/MF A02

The start of JRR-3M in 1990 was a great epoch to the neutron scattering research in Japan. Abundant neutron beam generated by the JRR-3M made it possible to widen the research field of neutron scattering in Japan. In the early days of neutron scattering, biological materials were too difficult to be studied by neutrons not only because of their complexity but also because of the strong incoherent scattering by hydrogen. However, the remarkable development of the recent neutron scattering and its related sciences, as well as the availability of higher flux, has made biological materials one of the most attractive subjects to be studied by neutrons. In early September 1992, an intensive workshop titled 'Neutrons in Biology' was held in Hitachi City by making use of the opportunity of the 4th International Conference on Biophysics and Synchrotron Radiation (BSR92) held in Tsukuba. The workshop was organized by volunteers who are eager to develop the research in this field in Japan. Numbers of outstanding neutron scattering biologists from U.S., Europe, and Asian countries met together and enthusiastic discussions were held all day long. The editors believe that the presentations at the workshop were so invaluable that it is absolutely adequate to put them on record as an issue of JAERI-M and to make them available for scientists to refer to in order to further promote the research in the future. ROOT GRAVITROPISM IN MAIZE AND ARABIDOPSIS Final Report, 1 Mar. 1992 - 30 Nov. 1993
Michael L. Evans 30 Nov. 1993 4 p
(Grant NAG10-84)
(NASA-CR-195710; NAS 1.26:195710) Avail: CASI HC A01/MF A01

Research during the period 1 March 1992 to 30 November 1993 focused on improvements in a video digitizer system designed to automate the recording of surface extension in plants responding to gravistimulation. The improvements included modification of software to allow detailed analysis of localized extension patterns in roots of Arabidopsis. We used the system to analyze the role of the postmitotic isodiametric growth zone (a region between the meristem and the elongation zone) in the response of maize roots to auxin, calcium, touch and gravity. We also used the system to analyze short-term auxin and gravitropic responses in mutants of Arabidopsis with reduced auxin sensitivity. In a related project, we studied the relationship between growth rate and surface electrical currents in roots by examining the effects of gravity and thigmostimulation on surface potentials in maize roots. Among the most fundamental issues of visual attention research is the extent to which visual selection is controlled by properties of the stimulus or by the intentions, goals and beliefs of the observer. Before selective attention operates, preattentive processes perform some basic analyses segmenting the visual field into functional perceptual units. The crucial question is whether the allocation of attention to these perceptual units is under the endogenous control of the observer (intentions, goals, beliefs) or under the exogenous control of stimulation. This report discusses evidence regarding the endogenous and exogenous control of attention in tasks in which subjects search for a particular 'basic' feature (e.g., search for a unique color, shape, brightness). The present review suggests that selectivity in these type of search tasks is dependent on the relative saliency of the stimulus attributes. It is concluded that the visual system automatically calculates differences in basic features (e.g., difference in shape, color, brightness) and that visual information occupying the position of the highest saliency across stimulus dimensions is exogenously passed on to the 'central representation' that is responsible for further stimulus analysis. Alternative explanations of the present findings and tentative speculations resulting from the present approach are discussed. DTIC

ECARHEART2 VERSION 1.0: PROGRAMMERS DOCUMENTATION
S. Stoeren and P. Neksae 1 Jul. 1993 44 p
(PB94-124633; STF23-A93028) Avail: Issuing Activity (National Technical Information Service (NTIS))

EcarHeart2 is a program for analysis of the cardiac function and the systematic and pulmonal arterial tree. It is an EchoDisp Custom Analysis Routine (ECAR) and runs under EchoDisp. This documentation is the programmers documentation of the EcarHeart2 code. It covers the core of EcarHeart2 and the calculation modules: Aortic pressure and flow; Wall stress; and Proximal inflow convergence. NTIS

THE AFIT MULTIELECTRODE ARRAY FOR NEURAL RECORDING AND SIMULATION: DESIGN, TESTING, AND ENCAPSULATION M.S. Thesis
James R. Reid, Jr. Dec. 1993 105 p
(AD-A274086; AFIT/GE/Eng/93D-33) Avail: CASI HC A06/MF A02

A two-dimensional, X-Y addressable, multiplexed array of 256 electrodes (16 x 16) has been fabricated using conventional semiconductor processing techniques. The individual electrodes are 160 microns x 160 microns approximating the size of the cortical columns; the overall array size is 3910 microns x 3910 microns. The array has been fitted to a chronically implantable package and tested for several days in a simulated neural environment. EEG-like data were collected successfully from individual electrodes in the array. This array improves on a previous design of a 16 electrode (4 x 4) array that was chronically implanted on the cortex of a laboratory beagle (Canis familiaris) in 1982. The original implant, located approximately over primary visual cortex, recorded both EEG and visually evoked response (VER) data. It proved the feasibility of multiplexing data directly from the surface of the cortex, thereby opening the possibility of very large arrays of electrodes since only a single wideband signal channel could address significant numbers of electrodes. REWARMING METHODOLOGIES IN THE FIELD
S. Feith, R. Hesslink, J. Reading, P. Kincaid, and R. Pozos 17 Nov. 1993 20 p
(NR Proj. M00-96)
(AD-A274744; NHRC-93-4) Avail: CASI HC A03/MF A01

The Heatpac is currently used by the U.S. Marine Corps to warm cold-stressed infantry personnel in the field. Recently, this system has been modified so a small wetting chamber called Humipac can be attached to the Heatpac so personnel can breathe warm humidified air. The air is saturated to 95-99% humidity with a temperature range of 45.3 to 49.4 C. In a series of experiments using a USMC issue sleeping bag, the effectiveness of the Heatpac was compared to the combined Heatpac/Humipac and to rewarming by shivering. Subjects wearing only swimming trunks were placed in 12.8 C water for one hour. At the end of that period, any of the three interventions were randomly assigned. In all conditions, the subject was placed in a sleeping bag. Heart rate, T(sub re) and T(sub es) temperatures, and metabolic rates were monitored during the cooling phase and for 120 minutes during the rewarming phase. Breathing the warm humidified air did not significantly alter the rate of body rewarming. In some cases, normal shivering induced as large an increase in core temperature as did the active interventions. Additional studies are underway to investigate the relative role that these various rewarming systems have on thermogenesis. DTIC

EFFECTS OF METHAMPHETAMINE ON VIGILANCE AND TRACKING DURING EXTENDED WAKEFULNESS Interim Report
R. R. Stanny, A. H. McCardie, and D. F. Neri Sep. 1993 36 p
(NR Proj. M00-96)
(AD-A274896; NAMRL-1386) Avail: CASI HC A03/MF A01

The effects of a 10 mg/70 kg oral dose of d-methamphetamine HCl on high-event-rate vigilance and tracking performance in a 13.5-hour sustained-performance session during a night of sleep loss are examined. At 0116 hours, seven subjects were administered d-methamphetamine, double-blind. The remaining six subjects were given a placebo. Values of sensitivity (d) in the vigilance task declined markedly during the night in the placebo group. The methamphetamine treatment reversed an initial decline in d' within approximately two hours of administration. The methamphetamine treatment also reversed increases in nonresponses (lapses) within approximately two hours of administration. Tracking performance also declined markedly during the night in the placebo group. The methamphetamine treatment reversed the decline in tracking performance. An analysis of fast guesses in the vigilance experiment disclosed no evidence to suggest that methamphetamine tended to increase impulsive responding. In fact, the methamphetamine treatment was associated with a small and nonsignificant reduction in fast guesses. The overall pattern of the results suggests that methamphetamine at 10 mg/70 kg produces genuine increases in efficiency that effectively counteract the effects of continuous work during a night of sleep loss. PRACTICE PATTERNS OF US ARMY MEDICAL DEPARTMENT PSYCHIATRISTS AND PSYCHOLOGISTS Final Report, May 1991 - Dec. 1993
Nancy K. Willcockson and James M. Georgoulakis Jan. 1994 27 p
(AD-A274787; HCSCIA-HR-94-002) Avail: CASI HC A03/MF A01

The present study is an evaluation of psychiatrist and psychologist patient care services from the Army's Ambulatory Care Data Base. The data from the present study did not reveal any evidence that psychiatrists performed patient care or medical services in any manner different from psychologists, with the exception that they prescribed medication. Psychologists were found (1) to spend more time with patients, (2) to provide a wider variety of patient care services, (3) to treat more patients with concurrent medical disorders, (4) to perform nearly all psychological testing evaluations, and (5) to be the sole medical professionals performing biofeedback and behavioral assessment. Both provider groups treated all of the same patient diagnostic categories, with some variation in patient diagnostic frequency, and neither group utilized ancillary medical procedures to any significant extent in its evaluation and management of patients. This data revealed that psychologists' are the almost exclusive providers of psychological testing evaluation, which is a work intensive, lengthy, and complex diagnostic process. Four significant variations were found: (1) time spent in evaluation, depended upon the type of assessment performed (e.g., personality, intellectual, neuropsychological, or a combination thereof; (2) the amount of direct provider time required by psychologists, which depended upon three factors--the complexity of the case, the type of assessment undertaken, and whether a psychological assistant was utilized; (3) the frequency with which types of evaluations were performed, with personality assessments accounting for almost one-half half of all psychological testing evaluations; and (4) the average number of visit days involved in an assessment, which, again, varied with the complexity of the evaluation. MONITORING ACTIVITY WITH A WRIST-WORN ACTIGRAPH: EFFECTS OF AMPLIFIER PASSBAND AND THRESHOLD VARIATIONS Final Report, Nov. 1990 - Oct. 1992

Timothy F. Elsmore and Paul Naitoh Feb. 1993 63 p
(Contract MIPR-91MM1505)
(AD-A274705; NHRC-93-18) Avail: CASI HC A04/MF A01

This project investigated some properties of the AMA-32 wrist-worn activity monitor. In the first phase of this project, a software program for the analysis of activity data was developed. The program permits rapid statistical and graphical summaries of activity data. The second phase of the project investigated effects of varying the sensitivity of the actigraph. Three different frequency passbands were investigated. The ability to differentiate sleep from wake was optimized with a 2 to 3 Hz passband, particularly with a high trigger threshold. Increasing sensitivity by lowering the trigger threshold or by broadening the passband reduced sleep/wake discriminability. The optimal sleep/wake discrimination parameters for the AMA-32 approximate those of earlier generations of wrist-worn actigraphs. The work in this report suggests research to investigate the utility of other actigraph sensitivity settings for differentiating movement patterns during sleep or for assessments of daytime workload. US ARMY AVIATION EPIDEMIOLOGY DATA REGISTRY: INCIDENCE AND OUTCOMES OF AVIATOR FLYING EVALUATION BOARDS Final Report

Kevin T. Mason and S. G. Shannon Oct. 1993 21 p
(DA Proj. 3M1-62787-A-879)
(AD-A274711; USAARL-94-2) Avail: CASI HC A03/MF A01

The Aviation Epidemiology Data Registry (AEDR) is a family of databases storing history and physical information on Army aircrewmembers. The AEDR lacks some aviation career endpoints, one being the outcome of flying evaluation boards (FEB's) for nonmedical disqualifications. The outcomes of 170 new FEB actions from 1985 through 1992 in active duty and U.S. Army Reserve aviators were reviewed. The overall incidence was 1.13 per 1,000 aviator-years. Aviators aged 25 through 39 were twice as likely to undergo FEB actions. The likelihood of restoration to flying duties after FEB was significantly lower if the FEB was for habits, character, and motivation, than if the FEB was for poor flying proficiency or failure to follow flight rules. Many nonmedical disqualifications leading to FEB require medical evaluation to rule out underlying mental disorders. DTIC

AEROMEDICAL ISSUES RELATED TO POSITIVE PRESSURE BREATHING FOR +Gz PROTECTION Interim Report, 1 Apr. - 31 Oct. 1992

Larry P. Krock Dec. 1993 13 p
(AF Proj. 7930)
(AD-A274717; AL-TP-1992-0024) Avail: CASI HC A03/MF A01

Positive pressure breathing as a method to enhance aircrew tolerance for repeated and sustained high +Gz exposures (PBG) was first considered many years ago. Use of Combined Advanced Technology Enhanced Design G Ensemble (COMBAT EDGE) as a G-protection measure increases overall tolerance to +Gz acceleration by reducing the fatigue associated with performing straining maneuvers during extended or repeated exposures to acceleration stress. Physiologically, PBG exerts its effects upon both the cardiovascular and respiratory systems. The principal benefit of PBG is the maintenance of elevated intrathoracic pressure with minimal voluntary effort on behalf of the individual. Some confusion exists with regard to the potential impact COMBAT EDGE may have on the physical health of aircrew. A certain unknown probability exists suggesting acute and/or long-term exposure to PBG may produce certain undesirable changes in the cardiopulmonary physiology of a pilot. This issue has resulted in the need to provide information regarding the current state of our understanding. Described herein are the principal physiologic issues raised concerning use of COMBAT EDGE, looking to the available literature, past experience, and current and future research answers. DTIC

MOLECULAR BIOLOGICAL STUDIES ON THE HUMAN RADIORESISTANCE AND DRUG RESISTANCE

Chang Min Kim and Weon Seon Hong Apr. 1992 20 p In KOREAN
Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-632682; KAERI/RR-1114/91) Avail: CASI HC A03 (US Sales Only)

We irradiated the MKN45 and PC14 cell lines with 500 rads and also established the adriamycin-resistant and cis-platinum resistant cell line. The genomic DNA and total RNA were extracted and subjected to the Southern and Northern analysis using various probes including heat shock protein 70, MDR1, fos, TGFb, etc. The mRNA transcript was increased 1 hour after the irradiation and sustained during the 48 hours and returned to the level of pre-irradiation. No significant change was observed with the drug resistant cell lines at the level of gene dosage. We suggest that the marked increase of the hsp70 transcript is a very important finding and is believed to be a good candidate for the modulation of the cellular response to irradiation and the radioresistance. A COMPARISON OF SLEEP SCORED FROM ELECTROENCEPHALOGRAPHY TO SLEEP SCORED BY WRIST ACTIGRAPHY Technical Report, Nov. 1989 - Feb. 1990

J. L. Caldwell and John A. Caldwell, Jr. Sep. 1993 33 p
(AD-A273739; USAARL-93-32) Avail: CASI HC A03/MF A01

During military operations, it has been found that soldiers often are required to work for long periods of time without rest. In order to assist commanders in determining how much rest soldiers receive, various methods of monitoring activity have been used. One unobtrusive method is to use wrist activity monitors (WAM's) to determine how long soldiers are required to work with little or no sleep. This study compared data from traditionally scored sleep using electroencephalographs (EEG's) to data from WAM's to determine the ability of WAMs to measure sleep. Based on this limited comparison study, it appears that the WAM is a good instrument to use to estimate sleep time when an EEG is not possible. The percent agreement between WAM sleep time and EEG sleep time is very high, with an average of almost 89 percent. The error tended to be in the direction of overestimation of sleep time by the WAM. Also, the current method of scoring using a set cutoff of counts is a suitable method. However, an overestimation of sleep most likely will occur when this method is used. Therefore, whenever actigraphs are used, a conservative interpretation of the data is to discuss 'rest time' instead of 'sleep time.' In addition, the quality of sleep as determined by normal EEG sleep staging cannot be assessed by the WAM. DTIC

PASSIVE AND ACTIVE BEHAVIOR OF THE CARDIOVASCULAR SYSTEM UNDER INCREASED GRAVITATIONAL LOADS IN A CHRONICALLY INSTRUMENTAL CONSCIOUS BABOON MODEL Final Report, 1 Feb. 1991 - 1 Jun. 1993

David A. Self, Curtis D. White, Richard W. Owens, John W. Fanton, and Ricky D. Latham Nov. 1993 27 p
(AF Proj. 2312)
(AD-A274344; AL/AO-TR-1993-0103) Avail: CASI HC A03/MF A01

Simultaneous recordings of right atrial, left atrial, left ventricular (LV) and aortic pressure (AOP), aortic root flow and LV dimensions were recorded in chronically instrumented baboons at rest and undergoing centrifugation that mimicked military aviation acceleration environments. We separated the early and late hemodynamic responses to increased +Gz loads during acceleration using a rapid onset-rapid return (ROR) (greater than 4.5 G/s) centrifugation protocol. +Gz onset resulted in immediate changes in vascular pressure from hydrostatic effects, followed by passive shifting of blood volume to dependent regions causing declines in systemic pressure above the hydrostatic indifference point (HIP) and in venous return. Stroke volume (SV) and mean cardiac power output fell. Distending carotid level pressure routinely fell during acceleration to levels well outside threshold values previously reported for carotid baroreflex function. Active compensation consisted of increases in heart rate, AOP and decreases in aortic flow. Previous +Gz load history had enormous impact on blood pressure regulation during increased +Gz loads and on baseline pressures existing prior to exposure to a second +Gz onset. Animals exposed to a conditioning run that saturated their short-term pressure regulatory mechanisms 5 min before a second +Gz exposure, displayed significantly higher mean aortic root pressures and consistently overshot their baseline operating points during centrifugation. We conclude that hemodynamic consequences of rapid-onset acceleration are extremely complex and may provide conflicting error signal information during compensatory adjustments. DTIC

PULSE WAVEFORM AND TRANSCRANIAL DOPPLER ANALYSIS DURING LOWER BODY NEGATIVE PRESSURE Interim Report, Jan. - Oct. 1992
Rainer K. Effenhauser and Lloyd D. Tripp, Jr. Apr. 1993 83 p
(AF Proj. 7231)
(AD-A274516; AL/CF-TR-1993-0097) Avail: CASI HC A05/MF A01

The use of lower body negative pressure (LBNP) as an acceleration pre-conditioning technique for space applications was investigated. The purpose was to evaluate changes in cephalic blood flow during LBNP. The intent was to see if detection or warning of impending syncope was possible, and to simulate effects which occur under exposure to +Gz. Ten subjects underwent the following LBNP profile while in a standing position: Five minutes of baseline at ambient pressure, followed by increments of -10 mm Hg every three minutes to a minimum of -50 mm Hg. They remained at -50 mm Hg for a maximum of twenty minutes or until presyncopal symptoms occurred. An additional five minutes of post-LBNP baseline data were collected. The analog pulse waveform, obtained from a pulse oximeter sensor located approximately at eye level on the subject's ear lobe. The pulse waveform analysis included pulse area, amplitude, and duration. Other physiological variables included: middle cerebral artery blood flow velocity using transcranial Doppler (TCD) sonography, and oxygen saturation obtained from a pulse oximeter. Six of the ten subjects experienced presyncopal symptoms during the LBNP profile. Significant changes were observed in several variables at the presyncopal endpoint and included: pulse waveform area ($P=0.0048$), pulse waveform amplitude ($P=0.0236$), cerebral artery blood flow velocity ($P=0.0001$), and cerebral artery pulsatility index ($P=0.0357$). AVIATION EPIDEMIOLOGY DATA REGISTER: INDEXING THE AEDR DOCUMENT LASER OPTIC ARCHIVE Final Report
Kevin T. Mason, Samuel G. Shannon, and Robert E. Post Oct. 1993 20 p
(DA Proj. 3M1-62787-A-879)
(AD-A274185; USAARL-94-1) Avail: CASI HC A03/MF A01

The Aviation Epidemiology Data Register (AEDR) is a family of databases storing health and physical parameters of Army aircrew. The components are administratively linked by social security number (SSN). A new component is an upgrade of the medical document microfiche archive to laser optic CD-ROM. The U.S. Army Aeromedical Activity requested assistance in creating an indexing scheme for the new system. They wanted to use a single SSN digit, the disks to fill at a uniform rate, and to keep the same aircrew member on the same disk even if multiple entries were made for the same patient. The SSN of each case in the microfiche archive was extracted as a reference population. Analysis of the frequency distribution of decimal values for selected SSN digits showed the last SSN digit would meet the stated requirements. Any of the first five SSN digits should not be used for indexing. DTIC

In this study, urine excretion was examined using tail-suspended rats as a model of muscle and bone atrophy in a weightless state. Subjects were 30 Wistar strain rats, classified into a control group, and suspended groups. In suspended groups, rats were suspended from the ceilings of the cages with wires pierced through the coccygeal bone for seven days, and urine was collected every 12 hours, as well as the amount of diets and water ingested was measured. As a result, the amount of diet and water ingestion was significantly decreased in the tail-suspended groups. Urine excretion in day was increased in all suspended groups, while that in night was different by when the suspension started; i.e. rats suspended at 19:00 increased in urine excretion, but those suspended at 7:00 did not show remarkable change. Comparing the ratios of urine excretion in night to that in day, they were significantly decreased in the suspended groups, whereas no observable change was detected in the control group. These results suggest that the circadian change of urine excretion may result from secretion and modification of Atrial Natriuretic Polypeptide (ANP) by glucocorticoids. Author (NASDA)

Metabolic change and endocrine variation of tail-suspended rats were studied as a model of atrophy in weightless state or long term bedding. Subjects were Wistar strain rats, suspended from the ceilings of the cages by wires pierced through the tails, and urine was collected every 12 hours. Seven days after the suspension, all rats were killed, and wet weight of associated organs, and testosterone, activated vitamin D3, hydroxyproline, Ca and Pi (Inorganic Phosphorus) concentration were measured, as well as Alkali Phosphatase (ALP) activity. As a result, in suspension groups, significant decrease was observed in body weight and in wet weights of the thymus, testicle and bones, whereas the adrenal gland weight was significantly increased. In suspension groups, there was also significant decrease in testosterone concentration, as well as tendency of decrease in vitamin D3. Ca and Pi concentrations in blood were significantly decreased within the normal range. In the bones of suspended group, ALP activity, the amounts of hydroxyproline, Ca and Pi were all decreased. These results suggest the correlation of muscle and bone atrophy with decrease of testosterone. The change of the bone components also reveals the decrease of bone density, which may result from the decrease of vitamin D3 in blood. Author (NASDA)

CHANGES IN FLUID AND ELECTROLYTE METABOLISM DURING WATER IMMERSION AT HIGH OR THERMONEUTRAL TEMPERATURE [KOON OYOBI CHUSEION SUISHINJI NI OKERU MIZU-DENKAISHITSU TAISHA NO HENDO]
Sachiko Omori, Kazumi Kanda, Chikashi Yamamoto, Sayoko Hayamizu, K. A. Kirsch (Freie Univ., Berlin, Germany.), Satoshi Iwase, Chihiro Miwa, Junichi Sugenoya (Aichi Medical Univ., Nagakute, Japan.), Tadaaki Mano, and Yoshiharu Murata *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 9-17 In JAPANESE (For primary document see N94-27442 07-52)
Avail: CASI HC A02/MF A04

It is known that water and electrolyte metabolism changes due to movement of fluid from lower part to upper part of the body when astronauts are in a weightless state. In addition, stress might effect on astronauts' metabolism during space travel. To study metabolic changes in this condition, subjects were immersed in thermoneutral water or hot water to load stress, and blood and urine samples were collected. As a result, Ht (Hematocrit), total protein and Ca concentration was decreased by immersion in thermoneutral water bath, which suggests that blood was diluted by fluid transferred into the vessel in a weightless state. In addition, decrease of aldosterone that was also observed may cause increase of Na in urine and urine flow. Contrastingly, by immersion in high temperature water, it was revealed that blood was condensed by sweating, and aldosterone was increased. These results suggests that stress loaded by high temperature might stimulate the hypothalamus that controls the secretion of the adrenal grand. Author (NASDA)

STUDY ON POSTURE CONTROL AND ADAPTION MECHANISM UNDER WEIGHTLESSNESS: RESULTS OF SECOND REHEARSAL FOR SPACE EXPERIMENT USING CARP Progress Report No. 45 [MUJURYOKU KANKYO KA NO UNDO SEIGYO TO SONO JUNNO NI KANSURU KENKYU: KOI NO UCHU JIKKEN, DAINIKAI RIHASARU SEIKA HOKOKU] **c54**
Shigeo Mori, Sadaharu Takagi, Satoru Watanabe, Akira Takabayashi (Fujita Health Univ., Toyohashi, Japan.), and Shiro Usui *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 18-21 In JAPANESE (For primary document see N94-27442 07-52)
Avail: CASI HC A01/MF A04

The 2nd rehearsal of the space experiment on posture control and adaption mechanism under weightless condition using carp was performed in April to May 1992, in order to simulate and practice the ground operation of the experiment. This rehearsal included transportation and breeding of carp in the pool of Kennedy Space Center (KSC) and examination of conductivity of implanted electrodes for brain wave. As a result, many carp died from encephalic infection after implantation of the electrode in KSC, especially in carp that had undergone statolithis extirpation in Japan. For this reason, several countermeasures were proposed, such as improvement of statolithis extirpation, prompt transportation system, suitable breeding procedure in KSC, selection of adaptable carp to a experimental unit, preparation for carp implantation, and supply system of carp. Above all, sufficient duration seems to be important for carp to recover from stress of operation or transportation. Therefore, a time table was prepared on the basis of these findings. An experiment on posture control and adaptation mechanism under weightless condition using carp was performed in Space Shuttle, Endeavor, in aviation of September 12-20, 1992 (FMPT (First Material Processing Test)/L-2). Although unexpected troubles occurred in ground operation, preparation could be completed thanks to the support system organized for this mission and the time schedule based on the results of two rehearsals that suggested importance of time margin for rest and adaption of carp. During aviation, there were several accidents such as entanglement of cables, but the experiment was completed and brain wave of carp could be recorded. The post-aviation test was also performed on the carp used in the space experiment that seemed healthy when returned from space travel, but at the end of all these experiments, the carp were demonstrated to be anoxia from analysis of water in the tank. As the data recorded during aviation were not obtained at this time, this report describes mainly preparation and process of experiment performed in the Space Shuttle and post-aviation. The Space Adaptation Syndrome (SAS) is one functional abnormality in a weightless state which leads to autonomic disorder. The cause of SAS is considered to be disorder of sensory coordination. Not only human beings but also other animals show abnormal behavior in a weightless state. Both of them can control movement and posture by three senses; i.e. sight, vestibule and somatesthesia. Among these senses, vestibule seems to be most affected under weightless condition, especially by disappearance of stimulation of statoliths. Therefore, it can be considered that SAS may result from sensory disorder by unbalance between the right and left vestibule senses. To review this possibility, right and left statolithses extirpated from carp in preparation of the Space Shuttle experiment were compared in respect to the shape and weight. As a result, right and left statoliths was similar in shape and weight, so that sensory disorder might not be caused by the difference between the weight of right and left statolithses. Physiological experiments in outer space requires special knowledge and technique. However the limited number of Payload Specialists (PS) cannot cover all the special fields, so that the role of telescience has become important in order to communicate experimental sequences or manipulation with Principal Investigators (PI), especially in experiments with flexible sequences. Several preliminary studies to simulate space experiments using testbedding revealed that human factors may provide an important effect on space experiments. Therefore, this study focused on operation ability of PS's under hypobaric hypoxic conditions that was evaluated by Kraepelin census, results of a video game, brain wave and heart rate. As a result, operation ability was not decreased in this condition, which suggests effectiveness of the teletool as a means of communication with PI's on ground and PS's in space. The method that direction by PI's was given as necessary was proved to be useful to optimize the time line if PS's have enough level of skill. In addition, several PI's directed two PS's to perform two experiments parallely. This parallel system seemed to be useful to save time, but it should be prudent to introduce it, because both PI's and PS's felt anxiety in the parallel system. Author (NASDA)

Avail: CASI HC A01/MF A04

Telescience is a remote operation support system which enables Principal Investigators (PI) on ground to direct a Payload Specialist (PS) and to manipulate directly the experimental system in outer space through teletools. In order to complete this system, simulation tests were performed on ground using testbedding. This report concerns the 4th simulation test, that focused on human factors under a particular condition of outer space, hypobaric hypoxia. In this test, operation and recognition ability was evaluated by results of Kraepelin census, results of a video game, scoring of subjective symptoms and measurements of brain wave and heart rate, for two subjects. As a result, no difference was observed in these abilities between normal and hypobaric hypoxic condition in one subject, probably because of experience of a decompression chamber that the subjects already had. The other subject, who had no such experience, revealed decrease in operation ability, while no or slight decrease was observed in recognition ability. These results suggests that a PS can respond to clear directions even in a particular condition that could decrease operation ability. Author (NASDA)

Telescience is a system to achieve highly credible experiment in outer space, directed by Principal Investigators (PI) on ground through teletools, and is inevitable to perform complicated physiological experiments that require flexible experimental sequences. For development and operation of telescience, preliminary experiments were performed under the hypobaric hypoxic condition in a testbedding. In this study, Contigent Negative Variation (CNV) was used as an objective index of attentiveness to evaluate credibility and adequacy of telescience experiments. In addition, a teletool which has been developed to determine CNV, was also evaluated in respect to operational effectiveness. As a result, it was demonstrated that CNV was a useful index to evaluate operation ability. In evaluation of the teletool, the up link image was effective in presenting, directing and discussing data from ground, especially in a phase requiring sophisticated manipulation. The down link data was improved to send only status data of device and statistic data on physiological and behavior indexes, which enabled: (1) reduction of information to 1/200; (2) decrease of PI's work; and (3) visualization and facilitation of data by making a graph. On the other hand, as the system largely depends on the computer support, several problems occurred due to less communication with PS's. Author (NASDA)

Motion sickness is a disease caused by vehicles with symptoms of digestive system, as well as pale and cold sweat. It is often observed in parabolic flight which produces microgravity and hypergravity. Recently, Electrogastrography (ECG) has been developed to record gastric electroactivity percutaneously. In order to examine whether ECG was available as an index of nausia and vomitting in motion sickness, ECG was measured during parabolic flight in this study. As a result, from scoring of motion sickness according to the diagnosis table, four in eight subjects were diagnosed as motion sickness. Although there was individual difference in amplitude and frequency of ECG, motion sickness occurred in subjects who had large amplitude before vomiting, or high frequency as nausea became worse. It was also observed that trajectory of ECG turned to the opposite direction when gravity shifted from 0 to 2 G. Therefore, ECG might be useful as an objective index of motion sickness, however, further studies with large population would be necessary in order to remove individual differences. Author (NASDA)

There are many reports that variation of gravity causes vertical nystagmus, probably resulting from changes of vertical acceleration sensed by statoliths system. This report concerns some findings obtained from simultaneous measurement of acceleration and vertical eye movement by Electronystagmography (ENG) in the parabolic flight under the following three conditions: (1) open eyed gaze with sitting position; (2) dark field with sitting position; and (3) dark field with reclining position. As a result, under the condition (1), no eye movement was detected during vertical gravity (Gz) altered from 2.3 to 0 G, while upward shift of eye position and downward nystagmus were observed during Gz changing from hypergravity to microgravity under the condition (2). On the other hand, while the eye position was shifted upwards under the condition (3), slight downward nystagmus was observed from hypergravity to microgravity. In both sitting and reclining positions, eye position was shifted before Gz decreased below 1 G. In addition, the posture or the direction that subjects were facing may affect the eye movement in parabolic flight, so that these factors should be considered in the study concerning sense of equilibrium. Usually, circulatory system is regulated under a constant gravity. However, in outer space, microgravity causes fluid to move to the upper part of the body, and the regulation of the fluid movement results in circulatory hypometabolism after returning in normal gravity. There is no effective countermeasure for this hypometabolism at present. In this study, adaptation of circulatory system under microgravity was examined by Electrogastrography (ECG) in parabolic flight using eight hamsters, including three normal, three hemilateral labyrinthectomized and two bilateral labyrinthectomized hamsters. ECG data was sent by telemetric transmitter implanted in the hamsters, with data of vertical gravity. As a result, two in three normal hamsters increased heart rate under the microgravity, while the other [illegible]thectomized hamsters did not reveal any change by variation of gravity [illegible]ultaneous human experiment demonstrated that although human h[illegible] was decreased under microgravity, and was increased under hy[illegible]vity in sitting position, it was not affected in supine position. This could be because in sitting position the fluid movement by change of gravity stimulates baroreceptor, leading to decrease of heart rate, while in supine position the change of gravity may not move fluid. As hamsters' posture is considered to be similar to human supine position, the effect of fluid can be excluded, so that the change of heart rate in hamster may be caused by change of vestibular sense or somatasthenia. It is known that optokinetic stimulation of extensive field causes body sway and inclination, probably because regulatory system works for the change of posture. In this study, body sway caused by optokinetic stimulation and inclining board was examined using frequency analysis. For optokinetic stimulation, random dot patterns was projected on the screen, moving downwards, and the body sway was recorded as the displacement of the center of the gravity. The locus of longitudal sway was analyzed by frequency analysis. As a result, power spectrum during the optokinetic stimulation was increased in the frequency from 0.2 to 0.7 Hz, while power spectrum variation was not varied markedly in this range by intentional inclining on the tilt board. Because previous studies revealed that the displacement of center of gravity was increased in the frequency of less than 0.1 Hz when eyes closed, the increase of frequency in 0.2 to 0.7 Hz may reflect the direct intervention of sight into the regulation of orthostatic position. In addition, it was suggested that the increase of power spectrum in the frequency of 3 to 4 Hz was in response to the posture regulation mainly caused by stretch reflex of the crural muscles. Avail: CASI HC A01/MF A04

Under microgravity, the gravity does not effect on the vestibular organ, especially on vestibulo-ocular reflex that senses the change of acceleration, which could be a dominant cause of space sickness. In vestibulo-ocular reflex system, the vertical acceleration (Y-axis) can elicit eye movement most effectively, while head position also plays an important role; i.e. prone position induces eye movement more than supine position. This can be explained by the effect of gazing at an imaginary target, because it has been reported that an imaginary target near to the head increased the reflex. In this report, the effect of imaginary fixed targets on vestibulo-ocular reflex was examined using a linear accelerator. Subjects imagined either body fixed target or space fixed target in prone position or supine position. The results revealed that imaginary target had remarkable effect on vestibulo-ocular reflex system. Especially, space fixed targets increased the reflex largely, probably because of non-visual smooth eye movement by senses other than sight, that is, acceleration or sound by the accelerator. Therefore, the body fixed target seems more appropriate to evaluate vestibulo-ocular reflex. Author (NASDA)

THE MECHANISM OF CALORIC NYSTAGMUS UNDER MICROGRAVITY. 1: CHANGES OF ENDOLYMPHATIC PRESSURE IN THE SEMICIRCULAR CANAL OF PIGEON BY CALORIC STIMULATION [MUJURYOKU KA NI OKERU ONDOSEI GANSHIN HATSUGEN KIJO. 1: HATO NO ONDO SHIGEKI NI TAISURU SUIHEI HANKIKANNAI RINPA ATSU HENKA]
Yoshiro Wada, Hiroyuki Suzuki, and Satoru Watanabe *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 64-67 In JAPANESE (For primary document see N94-27442 07-52)
Avail: CASI HC A01/MF A04

The caloric nystagmus is a nystagmus caused by pouring cold or hot water in the external auditory meatus, which is extensively practiced in clinical test of equilibrium function. The cause might be change of endolymphatic pressure in the semicircular canal according to caloric stimulation. This study examined the variation of endolymphatic pressure in response to caloric stimulation in pigeons in order to verify the hypothesis. The endolymphatic pressure was measured with a thermosensor directly on the semicircular canal, around which a silicon tube was twisted to stimulate by hot or cold water flowing through it. It was observed that the endolymphatic pressure of pigeons increased when stimulated by cold water and decreased by hot water, and the pressure was varied in proportion to the change of temperature. In addition, because this change was not affected by posture of a pigeon's head which fixed to keep the semicircular canal in horizontal or 45 degree-inclining position, the effect of gravity could be excluded. CARDIOVASCULAR FUNCTION DURING THERMONEUTRAL HEAD-OUT WATER IMMERSION IN THE ELDERLY [KOREISHA NI OKERU CHURITSUON KEIKA SUISHIN FUKAJI NO JUNKAN DOTAI]

Yoshiki Sugiyama, Chihiro Miwa, Hatsue Suzuki, Ye-Xiang Xue, Toshiyoshi Matsukawa, Satoshi Iwase, and Tadaaki Mano *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 68-71 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

Circulation system is regulated mainly by autonomic nerve system including pressor-receptor reflex. However, in the elderly, this regulation system did not seem to function, probably because of degeneration of baroreceptor and less fluid movement which may lower the suppression of muscular intension via sympathetic nervous system. The purpose of this study is to review circulatory regulation in the elderly. For examination of circulatory function, heart rate, blood pressure, mean stroke volume and cardiac output were compared between the elderly and the youth when immersed in thermoneutral water up to the level of navel or shoulder, or in standing position before the immersion. As a result, during immersion, heart rate was significantly decreased in the youth, while no decrease was observed in the elderly. Blood pressure was significantly increased in the elderly, but stroke volume was significantly increased in the youth. Cardiac output was increased only in the youth. These results reveal that in the elderly the blood pressure was increased significantly in spite of less cardiac output, which should be suppressed by negative feedback of sympathetic nervous system stimulated by the baroreceptor. However the function of pressor-receptor reflex may degenerate in the elderly. In addition, during immersion, water pressure moves fluid toward upper part of the body, and this fluid movement may stimulate the baroreceptor. However, the mechanism might not work sufficiently in the elderly. Author (NASDA)

Kirsch (Freie Univ., Berlin, Germany.) *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 72-75 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

This study examined the effects of temperature in water immersion by measuring skin temperature, core temperature, sweat rate, blood flow, body weight loss and urine volume, and compared the data between 34 C and 40 C water immersion. As a result, skin temperature and blood flow in forearms and precordia was increased, and blood flow in fingertips was decreased, during immersion in hot water. After immersion for 10 minutes, the core temperature and sweat rate was rapidly increased in high temperature water. During thermoneutral water immersion, skin temperature, sweat rate and blood flow did not change, and core temperature was lowered. Body weight loss in hot water immersion was larger by 300 g, while urine volume in thermoneutral water immersion was five times as much as that in hot water immersion. The sweat rate in the palm which represents psychogenic sweat was observed 20 minutes after the hot water immersion, probably because of stress by high temperatrue. In addition, in hot water, blood flow and skin temperature was increased by two steps; one is immediately after the immersion and the other is about 10 minutes after that. The first step might be the direct effect of water temperature, and the second might result from dilation of peripheral vessels by the change of core temperature that could stimulate thermoregulation system. It is suggested that the body weight loss might result from increased sweat in the case of high temperature, and from endocrine variation in the case of thermoneutral immersion. Author (NASDA)

DEVELOPMENT OF STIMULUS-SEEKING SCALE FOR EXPECTING INDIVIDUAL DIFFERENCES AGAINST CONFINEMENT STRESS [HEISA KANKYO SUTORESU NI TAISURO TAISEI YOSOKU NO TAMENO SHIGEKI KIKYU SHAKUDO NO SAKUSEI]

Mitsuro Kida, Masafumi Tanaka, Tetsuji Ito, and Kazuaki Kawano *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 76-83 In JAPANESE (For primary document see N94-27442 07-52)

(Grant MOE-04551001)

Avail: CASI HC A02/MF A04

Confinement stress is a current issue caused by an extremely few stimuli such as life in a satellite station or polar base. There are several levels of optimal stimulus for each individual, and if the individual difference could be measured, the confinement stress will be predicted. The purpose of this study was to develop a new stimulus-seeking scale based on Zuckerman's scale. In this stimulus-seeking scale, two levels were presumed; i.e. external stimulus-seeking that seeks external or physical stimulus, and internal stimulus-seeking that seeks internal or mental stimulus. Based on the two stimulus-seeking levels, a questionnaire was prepared to verify whether this classification was appropriate or not, as well as to review this scale by comparing the established scale of anxiety and disposition. From results of about 200 subjects, each 10 items were selected for internal and external stimulus-seeking level as appropriate items to distinguish individual features. Analytical study revealed the credibility and propriety of these items. Comparing scores of characteristic anxiety scale and disposition scale, there was correlation with external stimulus-seeking scale, while slight or no correlation was observed with internal stimulus-seeking scale. THE EFFECT OF BODY ORIENTATION ON THE PERCEPTION OF VERTICAL AND HORIZONTAL DISTANCE IN AN OUTDOOR SETTING [HIKENSHA NO SHISEI TO YAGAI NI OKERU SUICHOKU-SUIHEI KYORI NO CHIKAKU] c54

Atsuki Higashiyama and Kazuo Koga (Nagoya Univ., Japan.) *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 84-87 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

It is known that vertical distance appears longer than horizontal distance although they are the same length. The purpose of this study was to examine whether this effect depends on a subject's postures. 28 subjects were classified into upright-position group and lie-down position group, and three-story white building was used as a vertical scale. Subjects were told to move where they thought the distance from the building to the subject (horizontal distance) matched that from a mark on the side of the building to the ground (vertical distance). As a result, the longer the actual distance was, the longer the visual vertical distance appeared. Generally, vertical distance appeared longer in upright-position, whereas difference between visual vertical and horizontal distance was not observed in lie-down position as far as the actual distance was less than 6 m, and, even in the case that the actual distance is longer than 6 m, the differences between visual vertical and horizontal distance was not so much as those of upright-position. The most important finding was that the posture of subjects affected only the sense of vertical distance, rather than that of horizontal distance. Author (NASDA)

EYE-HEAD COORDINATION AND SWINGING OF THE VISUAL SCENE WHEN WEARING VISUALLY UP-DOWN REVERSING MIRROR FOR 14 DAYS [JOGEHANTENKYO CHAKUYOCHU NO GANKYU-TOBU UNDO TO SHIYA NO DOYO] c54

Hirokazu Yoshimura and Kazuo Koga (Nagoya Univ., Japan.) *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 88-92 In JAPANESE (For

primary document see N94-27442 07-52)
(Grant NOE-03551003)
Avail: CASI HC A01/MF A04

In this study, one subject wore a visually up-down reversing mirror for 14 days and recorded the subjective impression. During the period, eye-head movement and swinging of the visual scene were measured every three days. For eye-head movement, eye position and head position were recorded while the subject shook the head every one second. This experiment was performed in a dark room under the following two conditions: one is not to intend to fix the head or eyes in a particular position, the other is to intend to fix eyes at an imaginary point. As a result, on the second day, the eye movement traced in a reverse phase with the head movement, probably due to compensating the head movement, in both conditions. However, this tendency became decreased, and spikes of saccade began to be observed in the trace of eye movement. On the 15th day, the decrease of amplitude was obvious even in a trace under the condition of no intention, and, in condition of intention to fixate an imaginary point, the eye movement that showed saccade instead of pursuit movement coordinated with the phase of the head movement. For the swinging of the scene, critical fusion frequency of on-and-off light was measured under head-fixed condition and head-movement condition that shook the head every one second. As a result, the critical frequency did not change remarkably under the head-fixed condition, whereas it was increased once, then, after the 12th day, decreased under the head-movement condition.

It is expected that visual recognition and coordination of eye-hand or eye-head movement would be somewhat different in cosmic space. To examine the human behavior in space, a study was planned and operated as a part of the First Material Processing Test (FMPT) in the Space Shuttle Endeavor. In this study, saccadic eye movement and anti-gravity muscle activity of a Payload Specialist (PS) was recorded. This article reports the process and operation of this experiment. For the mission operation, staff training was started in 1991, in order to master general operation of the control facilities, technical terms used in flight control, and the downlink display, etc. In 1992, several simulation training were performed using the facilities of NASA. During the flight, three experiments were scheduled to operate, with support of downlink image data. Communication with PS was also capable; however, the number of circuit was limited so that it was permitted only when necessary. The experiment was completed almost as scheduled, although several changes were added.

Under hypobaric hypoxic condition, liver function is expected to be affected by induction of enzymes to adapt anaerobic condition. These biological responses were studied using rats induced hepatitis by galactosamine under the condition with altitude of 8,000 m. To examine liver metabolism, the activity of mitochondrial enzymes (citrate synthase, fumarase), cytosol glycolysis enzyme (hexokinase), glyconeogenesis enzyme FBPase (Fructose 1,6-bisphosphatase Steroid-Induced Enzyme) (tyrosine aminotransgerase) were measured. As a result, the activity of mitochondrial enzymes were decreased in hepatitis group, whereas that of hexokinase and FBPase was not changed by galactosamine. Both hepatitis and control group were not affected by exposure of high altitude hypoxia. However, tyrosine aminotransferase activity was increased twice as much as that of control group by exposure of high altitude hypoxia, while no change was observed in hepatitis group. The fact that mitochondrial enzymes were changed but not cytosol glycolysis enzymes in hepatitis group suggests that mitochondrial membrane could be damaged by galactosamine. In addition, galactosamine inhibited the steroidal induction of tyrosine aminotransferase under the condition of high altitude hypoxia. This implies that galactosamine was damaged endoplasmic reticulum, too. These results suggests that galactosamine-induced hepatitis is useful to examine how to switch the anaerobic metabolism to aerobic metabolism. Author (NASDA)

It has been revealed that Platelet Activating Factor (PAF) has a direct effect on the heart, as well as possibility to be associated with reperfusion injury in the heart. This study examined the effect of TCV-309, an PAF antagonist, on isolated rabbit heart and on CPK (Creatine Phosphokinase) release during reperfusion. For this study, isolated rabbit hearts were perfused aerobically for 30 minutes, followed by blocking of perfusion for 120 minutes, then, reperfused again for 60 minutes. TCV-309 was administered in perfusate before and after the block. In this experiment, Left Ventricular Developed Pressure (LVDP) and the amount of CPK released in perfusate for 5 minutes after the reperfusion were measured. As a result, LVDP recovery rate was 54.3 percent in control group, whereas it was remarkably improved up to 77.6 percent in TCV-309 administered group. The amount of CPK was significantly decreased in TCV-309 administered group. From these results, it can be concluded that TCV-309 can improve cardiac function after ischemia and inhibit CPK release. These results support the possibility that PAF might be associated with reperfusion injury of cardiac ischemia.

It is known that excess intracellular Ca(2+) causes cytotoxic reaction after reperfusion of cardiac ischemia. Ca(2+) is transported into the cell by Na(+)/Ca(2+) exchange propelled by H(+) concentration gradient, followed by Na(+)/H(+) exchange. It was reported that amiloride improved cardiac function in newborn rabbit hearts where intracellular Na(+) might be accumulated more than matured hearts probably due to anaerobic glycolysis. This effect depends on inhibition of Na(+)/H(+) and Na(+)/Ca(2+) exchanger. This study concerns protective action of a amiloride derivative, amiloride, 5-(N, N-dimethyl) hydrochloride (DMA) against reperfusion injury after ischemia, which can inhibit Na(+)/H(+) exchanger selectively. In this study, perfusion was blocked for 45 minutes after 15 minutes of preperfusion in isolated newborn rabbit heart, followed by reperfusion for 30 minutes, and Left Ventricular Developed Pressure (LVDP) was measured, as well as the amount of CPK (Creatine Phosphokinase) in perfusate for 15 minutes after the reperfusion was determined. It was also revealed that DMA barely effected non-ischemic heart from one to 10 micromoles, but 100 micromoles of DMA caused cardiac arrest. LVDP recovery rate was 51 percent in control group, whereas DMA improved it up to 1 percent. Comparing the amount of CPK, DMA group was decreased significantly than control group (68 unit/g vs. 10 unit/g). These results suggest that DMA improved LVDP recovery rate after reperfusion, and decreased CPK release, without any adverse effect on the heart. This effect was as much strong as amiloride. This study examined the responses of a cardiac muscle in the longitudinal (L) direction and transverse (T) direction stimulated by electric shock pulses (SP) using the cardiac muscles of guinea pigs. As a result, it was revealed that they responded differently by orientation of muscle fibers; i.e., the diastolic threshold of excitation in L direction was 1.4 - 1.6 times the strength as that in T direction. This suggests that L direction was more responsive to high intensity electric stimulation than T direction, probably resulting from electric potential (membrane potential) that is varied by the length of conductor in the same direction as electric field. However, in case of stimulating by 25 V/cm or more of SP's, the delayed responses were contrary to these results; i.e., decrease of resting potential and increase of contractility were larger in T direction than L direction, and vibration of membrane potential and spontaneous activity tend to occur in T direction. This is probably because electroporation that can pass ions unselectively after high-intensity electric stimulation does not present or presents slightly at the ends of longitudinal axis. Thus, electric coupling via gap junction of intercellular constitution that are different by orientation of muscle fibers may cause the different conductivity between T and L direction. In this study, the correlation between effects of low energy electric field stimulation on Effective Refractory Period (ERP) and cardiac fiber orientation was reviewed in order to clarify the mechanism of reentrant arrhythmias following DC (direct current) defibrillation. The ERP was measured using a cardiac muscle of guinea pigs stimulated by shock pulses (PS) provided to the longitudinal (L) direction and the transverse (T) direction. As a result, it was revealed that repolarization and ERP were delayed according to the intervals between basic stimulation and PS and intensity of low energy electric field stimulations. This effect was marked in the L direction than the T direction, probably resulting from the shape of cardiac fibers. They are usually longer in the L direction than the T direction by 8 - 10 times so that the maximum membrane potential in the L direction is estimated to be several times as much as that in the T direction. The difference of conductivity by directions causes anisotropy of tissue resistance. In addition, electrical coupling occurred effectively and extracellular resistance was lowered in the L direction, which might also cause the difference of electric density by the directions. Low energy DC electric field stimulation can delay ERP and repolarization, and the delay was modified by strength of electric field, interval of stimulation, and orientation of cardiac fibers, leading to inequal refractory period in different sites. This could be a cause of reentrant arrhythmias. Author (NASDA)

POSITIVE CHRONOTROPIC EFFECT OF MECHANICAL STRETCH ON THE SINOATRIAL NODE: ROLES OF NEUROTRANSMITTERS AND STRETCH ACTIVATED CHANNELS [KIKAITEKI SHINTEN NI YORU DOKESSETSU JIDONO KOSHIN NO KIJO NI KANSURU KENKYU] **c51**

Akiko Arai, Ryoko Suzuki, Itsuo Kodama, and Junji Toyama *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 114-116 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

It is known that stretch stimulation causes positive chronotropic effect on the sinoatrial node probably mediated by Stretch-Activated (SA) channels. This study examined the mechanism using the SA-channel blocker, gadolinium (Gd(3+)). The sinoatrial node of rabbit was extracted and the Spontaneous Cycle Length (SPCL) was determined during and after the stretch stimulation. As a result, it was revealed that the mechanical stretch caused positive chronotropic effect in proportion to the strength of the tension. The maximum effect was achieved immediately after the stretch stimulation and then decreased exponentially. When the neurotransmitter in the tissue was blocked pharmacologically by propranolol and atropine, residual effect after the stimulation disappeared. However, Gd(3+) did not decrease the positive chronotropic effect. These results suggests that this effect might result from not only neurotransmitters, especially noradrenaline, but also another factor. However, Gd(3+) sensitive SA channel might not play an important role in this process. Author (NASDA)

There is a possibility that gamma-radiation may affect a development of nerve cells by disturbance of neuronal migration. In the cerebral cortex, ganglionic layer is formed from inside to outside, and young nerve cells developed in the ventricule migrate through the primodial cortex to form the outer layer. This study examined the effect of low dose gamma-radiation on this migration using mice. Proliferative cells in S stage were labeled by Bromodeoxy Uridine (BrdU) at the 16th or 17th day of pregnancy, and 0.26 Gy of gamma-ray was radiated at the 17th day. These mice were killed at hours after the radiation or two days or six weeks after the birth, and each brain was examined. As a result, cell death was not observed in the ventricle hours after radiation. However, in the cerebral cortex of two day-old mice, migration of nerve cells in S-stage were disturbed, while those in G1 or G2 stage migrated normally. In six week-old mice, migration was disturbed in cells in both S-stage and G0/G2 stage. These results suggest that low-dose gamma-radiation disturbs the migration of premature nerve cells to the cerebral cortex. In this process, cells during DNA (Deoxyribonucleic Acid) replication were more sensitive to the radiation effect than those during differentiation. Author (NASDA)

A rolling mouse Nagoya has been used as a model of human spinocerebellar degeneration presenting hereditary ataxia. In this study, distribution of neurons containing Gamma-Aminobutyric Acid (GABA) in the brain of a rolling mouse Nagoya was determined immunologically using anti-GABA antibodies. In addition, mice with microcephaly by embryonal gamma-irradiation was also studied in the same manner. The brain of both mice were sliced, immunostained and observed microscopically. As a result, the cerebrum of the rolling mice appeared normal, and no histological abnormality was observed in the cerebellum in spite of some reports that presented the possibility of hypoplasia of the frontal lobe and decrease of granule cells. On the contrary, the gamma-irradiation mice had obviously smaller cerebrum and thinner cortex layer than control, but other parts of the brain was histologically normal. In the immunostain study, GABA-positive neurons were mainly observed in the cerebral cortex in both mice, striate body, thalamus and cerebellar cortex. In the cerebral cortex, they were distributed predominantly in the two and four layers of control mice, whereas they were distributed in all layers of the gamma-irradiated mice and rolling mice. In other parts of the brain, no particular difference was observed in the distribution of GABA-positive neurons between control group and gamma-irradiated and rolling mice group. Author (NASDA)

It is known that developing nerve cells are so sensitive to radiation that apoptotic death often occurs. In this process, condensation of chromatin and pykonosis, followed by reduction of cells, finally results in destruction of cells. It is considered that Transglutaminase (TG) plays an important role to form apoptotic body via cross-link of protein. In order to reveal the TG function, it was examined whether the TG activity was changed or induced during the apoptosis. One-day old mice were irradiated by gamma-rays to cause apoptosis in the outer granule layer of the cerebellum. As a result, pykonosis increased 3 hours after the radiation, achieved the peak after 5 hours, then gradually decreased in the cerebellum, while the TG activity was changed in accordance with the change of pyknosis. TG activation and induction might strengthen the cross-link of protein which stabilizes apoptotic body and prevent leak of intracellular substances. Thus, these results support the idea that TG may function in occurrence of apoptosis. Author (NASDA)

The incidence of stroke and cardiac infarction increases during and immediately after bathing; however, it is not sufficiently understood what is the effect of bathing, especially on the circulatorysystem. In this study, the changes of core temperature, skin blood flow, blood pressure and heart rate were measured to compare the effect of bathing in 34 C water and 40 C water on healthy human subjects. As a result, in 34 C bathing, skin blood flow and systolic pressure did not change, while core temperature, diastolic pressure, mean blood pressure and heart rate were decreased. On the contrary, in 40 C bathing, core temperature, skin blood flow and heart rate were significantly increased, and systolic, diastolic and mean pressure were decreased significantly. Generally, bathing effects circulatory system by static water pressure and water temperature, but 34 C bathing receives only static water pressure. Therefore, the difference between 34 C and 40 C bathing could result from the effect of water temperature. This effect includes an increase of peripheral blood that may decrease the amount of central blood, leading to decrease of blood pressure in 40 C bathing. The reverse response of heart rate was explained as follows: in 34 C bathing, increase of central blood by static water pressure may stimulate baroreceptor to decrease heart rate, whereas, in 40 C bathing, baroreceptor was stimulated oppositely, as well as stimulation of the hypothalamus by high core temperature also functioned to increase heart rate via sympathetic nerve system. Avail: CASI HC A01/MF A04

The Japanese prefers hot water bathing of 41 - 43 C; however, it was reported that cardiovascular and cerebrovascular diseases often occurs during hot water bathing. This study examined physiological effects of 41 C bathing for 20 minutes on healthy human subjects. As a result, heart and respiration rate, skin temperature and skin blood flow were increased, while blood pressure was decreased. When bathing, the first response could be dilation of peripheral vessels that decreases circulatory blood and cardiac output, which might result in immediate decrease of blood pressure and rise of heart and respiration rate. The second response which occurred 10 minutes after bathing was increase of heart rate and respiration rate, probably resulting from elevation of core temperature that also stores blood in peripheral vessels and decrease circulatory blood, and from stimulation of the hypothalamus by high core temperature to activate sympathetic nerve system. Sweat was observed 10 minutes after the bathing, which would be thermoregulation against core temperature elevation. Author (NASDA)

Avail: CASI HC A01/MF A04

This study examined physiological response (mean skin temperature)

and psychological response (feeling of hot and cold, cool and warm, comfort and desire for elevating or lowering room temperature) of human subjects for every month in case of changing room temperature from 18 to 26 C and from 34 to 26 C. For each response parameters, linear regression line was obtained from the relation of the response with change of room temperature. Concerning skin temperature, regression lines of each month were compared between rising and lowering temperature condition, and the inclines in the two conditions differed remarkably during June to August. This suggests that during summer sweat lowers skin temperature in 34 C condition so that the incline becomes gentler around the temperature. The incline of hot and cold feelings was not varied by seasonal changes, but generally, the inclines were steeper in rising temperature than lowering temperature. This is because at 18 C subjects complained coldness more than the degree of complain of hotness in lowering temperature. In the desire for room temperature, the Y intercepts were smaller in winter, which suggests that a man is satisfied to higher temperature during winter.

Avail: CASI HC A01/MF A04

The purpose of this article is to review the studies on environmental evaluation and changes of comfortability by dynamic thermal conditions, especially on a effect of seasonal changes, in order to achieve a coordinated environments not depending on large energy consumption but considering ecological system on the entire earth. From these studies, it was revealed that the change of room temperature caused physiological and psychological changes. The similar physiological changes were also observed in seasonal changes, although the peak of hot or cold temperature preceded the peak of physiological responses by about two months. The senses of warm or cool seem to largely depend on a physiological factor (hormone or metabolism), and a mental factor (scenary or color). The adaptability is a behavior to reach such warm or cool condition by anticipating the seasonal changes. There are two factors that effect thermo-comfortability: seasonal factor, such as metabolism, meteorological condition, or scenary, and seasonable factor, such as admiration of seasons. It seems to be important to consider both factors for design and management of comfortable environment.

THE INTRACELLULAR SECOND MESSENGER SYSTEM IN c-fos GENE INDUCTION BY ACTH [ACTH NI YORU C-FOS IDENSHI YUDO NO SAIBONAI SEKANDO MESSENJA] c51

Norihiro Miyamoto, Kazumi Kanda, Hiroyoshi Hidaka, and Hisao Seo *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 145-147 In JAPANESE (For primary document see N94-27442 07-52)
(Grant MOE-04671469)
Avail: CASI HC A01/MF A04

In the previous report, it was demonstrated that Adrenocorticotroic Hormone (ACTH) induced to express the c-fos gene, a cellular tumor gene, transiently in the early stage in hypophysectomy rats. Several intracellular second messengers might participate in the c-fos gene induction, including cAMP (cyclic Adenosine 3', 5'-monophosphate) dependent kinase (A-kinase), proteinkinase C (C-kinase), and Ca(2+)/calmodulin-dependent kinase (CaM-kinase). This study examined the function of these messengers in c-fos gene induction. To the primary culture of rat's adrenal cells, an activator of either A-kinase, C-kinase or CaM-kinase was added, as well as an A-kinase inhibitor. As a result, c-fos mRNA (messenger Ribonucleic Acid) was remarkably increased 60 minutes after A-kinase activator, cAMP, addition, and decreased to the level before the addition at 180 minutes. The amount of corticosterone in the culture was increased in proportion to time. The A-kinase inhibitor, H-89, inhibited the increase of mRNA, as well as production of corticosterone, in dose-dependent manner. However, the activators of C-kinase and CaM-kinase did not increase the mRNA and corticosterone. These results suggest that the c-fos gene induction by ACTH may mediated by cAMP as a intracellular second messenger, and that C-kinase and CaM-kinase may not participate in c-fos gene induction as a second messenger.

Avail: CASI HC A01/MF A04

This article presents the responses of human skin fibroblasts to the stimulus of thyroid hormone. In previous studies, the mechanism was examined with monolayer culture, however, different stages of cell cycle were observed among cells. On the other hand, cells are considered to stay at G(sub 0)-stage in the spheroid culture. In this study, this spheroid culture was applied using a thermo-sensitive polymer which has a property to become insoluble above 30 C and soluble below the temperature. Human skin fibroblasts were cultured in solid medium at 37 C, and when confluent, it was cooled to 4 C to melt the polymer so that the cells were suspended in the medium and gradually formed spheroids. Triiodothyronine (T(sub 3)) was added to the culture when spheroid was formed and Fibronectin (FN) mRNA (Messenger Ribonucleic Acid) and collagenase mRNA was determined as indices of the response. As a result, FN mRNA was decreased to two-thirds by T(sub 3) addition, while collagenase mRNA was not changed by T(sub 3). There is some contradictions between these results and those from monolayer culture, because the effect of proteinkinase C cannot be excluded from the latter system due to containing cells with different cell cycles. Therefore, the spheroid culture may be superior in examining the pure effect of thyroid hormone.

It was demonstrated that the response to thyroid hormone was weakened in hepatocytes of proliferation phase due to inhibiting the expression of T(sub 3) response genes. This study examined the gene expression of rat alpha-Retinoid X Receptor (RXR-alpha) cDNA (complementary Deoxyribonucleic Acid) that is a T(sub 3) receptor auxiliary protein presenting in the liver, in order to clarify the mechanism of the thyroid hormone response in hepatocytes. For cDNA, RXR alpha cDNA was amplified by RT (Reverse Transcription)-PCR (Polymerase Chain Reaction) from total mRNA extracted from mice liver, and was cloned, and the sequence was determined. As a result, it was proved that the cDNA was homologous to the human RXR alpha DNA in 2.1 percent. Gene expression of RXR alpha was examined using regenerating liver, primary cultured hepatocytes, and sham-operated liver. The three cells were cultivated by monolayer culture and spheroid culture, amplified by PCR, and the RXR alpha mRNA was identified on electrophoresis. As a result, no difference was observed in respect to mRNA expression among three kinds of cells, and between two culture methods. Therefore, it can be concluded that gene expression of

RXR alpha mRNA (messenger Ribonucleic Acid) are not related with the decrease of the thyroid hormone response in proliferating hepatocytes.

Recently, it has been demonstrated that expression of Pit-1, an homeobox gene, is necessary for differentiation and proliferation of growth hormone, prolactin and thyroid-stimulating hormone in the anterior pituitary of rats, and that Pit-1 functioned as a transcription regulatory factor for the expression of hormone genes in each cell. Furthermore, a group of proteins called the POU family, that have a highly homologous domain with the Pit-1 gene, were found in the central nerve system, testicle, and B-cells. In this study, mRNA's (Messenger Ribonucleic Acid) were extracted from several organs, to find new POU gene. As a result, mRNA's of the hypothalamus, thyroid gland, thymus, adrenal grand and testicle were amplified by RT (Reverse Transcription)-PCR (Polymenase Chain Reaction), and their cDNA (complementary Deoxyribonucleic Acid) were revealed to be highly homologous to the human Oct-1 gene, which is of the POU family. The cDNA amplified from mRNA of the pituitary was identified as the Pit-1 POU domain. The mRNA of the pancreas could not be amplified. These results suggest that the cDNA's cloned in this study were rat Oct-1 cDNA, and that the Oct-1 POU domain sequence could be ubiquitous in vertebrates. In respect to organs, the Oct-1 gene was found in almost all organs except for the pancreas.

Long-term hemodialysis usually causes dialysis amyloid arthropathy. It was demonstrated in the previous studies that sera from long-term hemodialysis patients promoted the production of Collagenase (CS) that plays an important role in degradation of interstitial tissue in synovial cells. This study examined whether this sera varies the expression of mRNA of Stomelysin (SN) and Tissue Inhibitor of Metalloprotease (TIMP). It is known that SN promotes degradation of interstitial tissue together with CS synergistically, and TIMP inhibits such degradation by blocking both proteases to reconstitute interstitial tissue. Sera from long-term dialysis patient was added to subcultured synovial cells, and the mRNA (messenger Ribonucleic Acid) was extracted and determined. As a result, mRNA of CS and SN was increased three times as much as that of control in which sera from healthy person was added. On the contrary, at the most, only a slight difference was observed in TIMP mRNA expression between sera from patient and a healthy person. This suggests that sera from the dialysis patient change synovial cells to promote degradation of surrounding interstitial tissue.

Thyroxine-binding globulin complete deficiency is a hereditary disease that is defined by a serum Thyroxine-Binding Globulin (TBG) level of less than 5 mg/l. It has several subtypes including Thyroxine-Binding Globulin Complete Deficiency in Japanese (TBG-CDJ) which produces TBG with a deficit of 22 amino acids from the C-terminal, probably because of mistranslation of genetic code resulting from a deficit of one base. The purpose of this study was to reveal the mechanism of TBG-CDJ by examining the synthesis and release of TBG in COS-1 cells derived from a monkey's renal cells to which normal TBG (TBG-N) or mutant TBG (TBG-CDJ) was induced. As a result, the presence of intracellular TBG was identified in the cell induced TBG-CDJ for a relative long period. This suggests that something interfered with the release of normal TBG in the TBG-CDJ cells. From results of cell fractionation and sensitivity to endoglycosidase H, it was revealed that TBG was stored in RER (Rough-Surfaced Endoplasmic Reticulum) and was not transported to Golgi bodies. This is probably due to the C-terminal which might be important for intracellular transportation was varied in TBG-CDJ, and the tertiary structure was also considered to be changed.

Avail: CASI HC A01/MF A04

This study examined the development of Purkinje cells in a serum-free medium. The cerebellum of newborn mice or one week-old mice were trypsinized, and the free cells were cultivated in the serum-free medium at 37 C and under 5 percent CO2. To identify Purkinje cells, the antibodies for vitamin D-dependent Ca Binding Protein (CaBP) that are present in Purkinje cells were used for immunostain. As a result, slightly large sphere cells were stained at the first day of the cultivation. At the seventh day, Purkinje cells were observed with long axons and short dendrites that became longer at the 14th day and at the 21st day. Purkinje cells with branched axons were observed. The process of cell development in vitro was almost similar to that in vivo. It was reported that synapses of granule cells and Purkinje cells were observed electrophysiologically in vitro. Therefore cultivation of undeveloped Purkinje cells might be a useful model system to study the developing of nerve cells in the cerebellum.

Avail: CASI HC A01/MF A04

This study compared the development of the cerebellum between suncuses and rats by the expression of protein kinase C type 1 isozyme which is only present in the nervous system, especially in the Purkinje cells of rats and rabbits. The expression was identified by immunohistological method and immuno-blot method; i.e., the cerebellums were extracted from zero, one, three, five, 10, 15, 21, and 42 day-old suncuses and rats were sliced, immunostained, and observed microscopically, or homogenated and analyzed by electrophoresis. Purkinje cells were observed in the cerebellum of newborn suncuses, and their numbers increased as time passed, while they were not found until the third day in rats. In the immunohistological study, Purkinje cells were identified by type 1 isozyme in newborn suncuses and in 15 day-old rats. In the immuno-blot study, these cells were expressed in newborn suncuses and in 10 day-old rats. This suggests that the development of Purkinje cells was underway in suncuses at birth because their pregnancy period is longer than rats. Author (NASDA)

Avail: CASI HC A01/MF A04

In a previous study, it was demonstrated that rats in which microcephaly was induced by intraperitoneal injection of Methylazoxymethanol (MAM) on the 15th day of pregnancy (MAM rat) had underdeveloped serotonin nerve fibers in the raphe nuclei. There are some reports that monoamine concentration, including serotonin, is increased in the cerebral cortex and other subcortex regions of MAM rats. This study compared the distribution of serotonin nerve fibers in the visual cortex between a MAM rat group and control group. Both groups rats were killed on the first, third, or fifth day after birth, the brain was extracted, and the brain was examined for abnormal development of serotonin nerve fibers and nerve endings in the visual cortex by immunohistological method. EFFECTS OF ML-9, A MYOSIN LIGHT-CHAIN KINASE INHIBITOR, ON PREIMPLANTATION DEVELOPMENT OF THE MOUSE [MAUSU NO CHAKUSHOMAE HASSEI NI OYOBOSU MIOSHIN KEISA KINAZE SOGAIZAI ML-9 NO EIKYO] c51

Nurul Kabir, Hideki Yamamura, Yoshiko Takagishi, Minoru Inoue, Senichi Oda, and Hiroyoshi Hidaka *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 177-179 In JAPANESE (For primary document see N94-27442 07-52)

(Grant MOE-04670012)

Avail: CASI HC A01/MF A04

The purpose of this study is to reveal whether myosin light-chain kinase participates in preimplantaion development. Rat embryos were extracted 44 hours after fertilization, and they were cultivated for four days at 37 C in air containing 5 percent CO2. In the medium, an inhibitor of myosin light-chain kinase, 1-(5-chloronaphthalene 1-sulfonyl) 1H-hexahydro 1,4-diazepine hydrochloride (ML-9), was added at concentrations of 1, 10, or 50 micro M. The development was expressed by biological ages corresponding to each developing stage, and the relation with the biological age and time was examined. As a result, development of the embryo was inhibited by ML-9 in a dose-dependent manner. This implies that myosin light-chain kinase may participate in the preimplantation development of a mouse, and the intracellular regulation may be mediated by Ca-calmodulin-myosin light-chain kinase pathway. It is known that 1-oleolyl-2-acetylglycerol (1,2-OAG), an activator of proteinkinase, causes compaction-like aggregation in embryos in two, four, and eight-celled stages. This study examined the compaction-like aggregation induced by 1,2-OAG using an electron microscopy, especially the boundary surface of the blastomere and the microvillus on the outer surface, and compared it with physiological compaction. Embryos were extracted from B6C3F1 mice, cultivated till two, four, eight, or compaction stage, and 1,2-OAG was added. The embryos cultivated in the 1,2-OAG free medium had microvillus on the surface of blastomeres in two, four, and eight-celled stages, but they did not have a intracellular junction. In the 1,2-OAG treated embryos, microvillus was observed on the outer surface of blastomeres but not in the boundary surface, and the intracellular junction was not observed. The embryos with physiologically induced compaction had microvillus on the outer surface, and the intracellular junction was formed between the boundary surfaces. Author (NASDA)

Avail: CASI HC A01/MF A04

Retinoic acid has a strong teratogenic effect, and it participates in embryonic development extensively. In previous studies, the mouse embryonic ectoderm was cultivated in vitro at the early primitive streak stage, and it was found that most embryos differentiated to epithelial cells and fibroblasts but did not seem to be committed to nerve cells. This study examined whether the embryonic ectoderm can differentiate to nerve cells in the presence of Retinoic Acid (RA). The embryos were extracted from mice at the early primitive streak stage, cultivated in a medium with RA for 20 hours, then removed to an RA-free medium. Cell differentiation was observed morphologically, and nerve cells were identified by the immunohistological method using anti-neurofilament monoclonal antibodies. As a result, the differentiation of nerve cells was observed at the fifth day of cultivation, and this was identified immunohistologically. However, the number of differentiated nerve cells was not constant among each culture. Author (NASDA)

ANORECTAL MALFORMATIONS INDUCED BY INTRAPERITONEAL INJECTION OF ALL-TRANS RETINOIC ACID IN SUNCUS [SUNKUSU NI OKERU ORU TORANSU RECHINOIN SAN FUKUKONAI TOYO NI YORU SAKO NO YUHATSU] c51

Ryozo Hashimoto, Senichi Oda, Minoru Inoue, and Hideki Yamamura *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 186-188 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

All-trans Retinoic Acid (RA) is a strong teratogenic agent that causes several malformations including anorectal malformation. The incidence of human anorectal malformation is reported to be relatively high (0.02 percent), so that it is important to study the development mechanism using animal models. The purpose of this study was to clarify whether a suncus is available for a experimental model of malformation development. Therefore, the suitable amount and timing of RA administration was determined to achieve high incidence of anorectal malformation. RA was injected 50, 100, or 200 mg/g weight to suncuses intraperitoneally at the 10th, 11th, 12th, or 13th day of pregnancy. Corn oil was injected as a control in the same way. The fetuses were extracted at the 27th day and observed microscopically. The highest incidence of anorectal malformation was observed in the group administered 100 mg/g weight RA at 12th day (88.2 percent). Administration at 10th day did not cause anorectal malformation. Administration at the 13th day caused tail malformation and only one case of anorectal malformation. In the case of 200 mg/g weight RA administration, all of the fetuses were dead. As a result, anorectal malformation can be induced by RA in suncuses with high incidence. This could be useful for pathological study of the development of anorectal malformation. Author (NASDA)

Recently, the experimental demand for swine has increased, especially in the field of medicinal biology. For experimental use, it is necessary to understand normal fetal development, and ossification can be used as an index after organogenesis. This report presents the observational results of the timing of ossification and order in swine fetuses. The fetuses were extracted from the 32nd to 53rd day of pregnancy, fixed in ethanol, stained for the bones, and observed microscopically. As a result, ossification began in the mandible and the regions around the orbits on the 34th day. Until the 39th day, ossification of the cranium and facial bones had begun except for hyoid bone which began after the 52nd day. In the spine, ossification of the cervical vertebrae, ribs, and lumbar vertebrae was observed on the 39th day. Other vertebrae began to develop from anterior to posterior. For the limb bones, the humeri ossified on the 34th day. The scapulae, ulnae, radii, ilium, femora, tibiae, and fibrae ossified on the 39th day. The order of skeletogeny of feet and hooves was also determined in detail. Author (NASDA)

This report discusses the development of inbred strains of Japanese wild rats (Rattus norvegicus) and the characteristics of these strains. Twelve pairs of wild rats were bred, and inbred strains were developed by sibling mating. The gene of hair color was analyzed for each of the strains, and a biological marker gene was detected by electrophoresis. As a result, five inbred strains were developed: A, B, C, D, and E. Strain A rats were gentle, docile, and seemed most suitable for experimental rats. They have stable breeding potential. Strain B rats have the mutant gene for hair color and eye color, and their characteristics and fertility are similar to those of strain A rats. Strain C rats were undersized, and may have a maker gene--transferrin mutant. Strain D rats showed marked maternal aggression. Strain E rats were developed from a different pair of captured rats from the other four strains. They are slightly gentle and docile, and their breeding potential is unstable. Author (NASDA)

It has been reported that crossbred suncuses express a high frequency of mutation in size, shape, or number of chromosomes. Hence, they are an appropriate model for studying pairing or reconstitution of chromosomes. This study examines the chromosome pairing and shape of nucleolus from zygotene stage to diplotene stage of meiosis using spermatocyte of crossbred suncuses. The subjects were 17 mature male suncuses from eight breeding groups. The testicles were extracted, separated with a thin needle, fixed on a slide, and staind by silver staining. The spermatocyte chromosomes were observed by an electron microscopy and compared with other mammals, such as the Chinese hamster or mouse. As a result, no difference was observed between suncus and other mammals in respect to the behavior of chromosomes and shape of spermatocytes in prophase of meiosis. However, the behavior of the sex chromosome was apparently different from other mammals; i.e., the sex vesicle appeared in early prophase in the suncus, as opposed to late prophase in other mammals. Detail observation of pairing and shape of nucleolus in prophase of meiosis may be useful to study complicated meiosis in crossbreeding suncus with various number or shape of chromosomes. As an experimental model for chronic inflammation, rats with arthritis induced by adjuvant are used extensively. A phologogenic agent is usually administered to these rats at the base of the tail or the foot. A severe inflammatory response with marked swelling usually occurs at the administration site on the first day. This rapid and severe response is not suitable for experiments that measure the foot volume as an index of inflammation. Therefore, injecting the adjuvant at the one-third distal site of the tail was used in thisstudy. The purpose was to clarify whether the injection causes suitable inflammatory response as a model of chronic inflammation and to prepare control data on these rats. Author (NASDA)

In previous studies, it was shown that inflammatory edema could be affected by a neurogenic inflammation caused by polymodal receptor stimulation using adjuvant-induced arthritis rats. This study examined the effect of mechanical stimulus on inflammatory edema while varying the concentration of the phlogogenic agent. The subjects were 13 Lewis strain rats, to which either 0.6 ($N = 3$), 0.4 ($N = 3$), 0.2 ($N = 5$), or 0.1 mg ($N = 2$) of adjuvant was administered at the one-third distal site of the tail. Each rat was forced to move everyday after the administration, and the foot volume was measured before and after the movement and compared with non-movement group. As a result, the foot volume is not different between the movement group and non-movement group in the case of administered 0.4 mg and 0.6 mg adjuvant; however, 0.2 mg adjuvant rats revealed remarkably larger foot volume in the movement group than the non-movement group. The 0.1 mg adjuvant rats, however, showed the opposite response to 0.2 mg adjuvant rats; the foot volume was smaller in the movement group. Assuming that the greater the concentration of phlogogenic agent gets, the more severe the inflammation becomes, these results suggest that polymodal receptors may be stimulated by mechanical stimulus in a certain inflammatory state and may result in occurrence of edema by neurogenic inflammation. It was known that the narcotic effect was prolonged in adjuvant-induced arthritic rats, probably due to decrease of the liver microsome activity. Recently, a finding was obtained that opioid analgesics prolongs the narcotic effect of pentobarbital. This suggests that the opioid pathway might be related to the prolongation in adjuvant-induced arthritic rats, and this possibility was examined in this study. The subjects were six Lewis strain rats classified into the control group ($N = 3$) and the adjuvant-induced arthritis group ($N = 3$). In both subjects the narcotics were administered intraperitoneally, and the period that wink reflex disappeared was measured as the effective time of the narcotics. The same measurement was performed on subjects preadministered with naloxone. As a result, the effective time of adjuvant group was longer than that before adjuvant administration; however, in case of preadministration of naroxone, the effective time became shorter. In the control group, the effective time became slightly shorter in case of naroxone preadministration. Author (NASDA)

It was demonstrated that polymodal receptors responsive to noxious stimuli are sensitive to capsaicin (CAP), a phlogogenic agent, in peripheral levels. The fact that polymodal receptors present in Dorsal Root Ganglions (DRG) and the cells in DRG can bind with and be stimulated by CAP suggests that the membrane of DRG cells might respond to CAP. In this study, the size of dosal root ganglion cells was compared with other ganglion cells using a retrograde tracer method. Fast Blue (FB) was injected to the testicle and epididymis or the left superior testicular nerve of male dogs, and the diameter of the cells in the first and second lumber vertebra (L1 and L2) was measured. In case of administering FB at the testicle, the mean diameter of labelled cells was 35.7 micrometers, whereas it was 31.7 micrometers when administered at the superior testicular nerve. The results of the normality test revealed that the cells labelled at the testicle were intermingled with several sizes of cells. It is known that the dorsal root ganglion cells can be morphologically classified into small cell and large cell. The cells labelled at the superior testicular nerve were small cells, which implies that afferent neurons that control the testicle via superior testicular nerve may correspond to small cells. When FB was administered at the testicle, the fluorochrome may stain not only afferent neurons but also other cells. Therefore, the size of afferent neuron could be determined by the FB-labelled cells administered at the superior testicular cells. It can be concluded that the test of normality is useful to detect intermingled cells in the study using retrograde tracer method. Author (NASDA)

It was reported that Cholecystokinin (CCK) participates in tachyphylaxy of opioid analgesics. The CCK receptor is classified into two subtypes; type A and type B. The effect of a type B receptor was examined using highly selective inhibitors, L-365 and 260, because B receptors are present mainly in the brain. The thin-fiber muscular afferent nerves of cats were stimulated every 35 minutes and L-365 or 260 was injected slowly for 1 minute intravenously, while respiratory response was monitored, and respiratory output was determined as an index. The concentration of inhibitor was 0.03, 0.1, 0.2, 0.3, 1.0 mg/kg, in the order of administration, and, at the last of them, naroxone, an inhibitor of opioids, was administered. As a result, the tachyphylaxis of Aspiratory Suppression (AS) that was induced by repetitive stimulation of thin-fiber muscular afferent nerves was inhibited by CCK-B (CCK Type-B) receptor inhibitor, L-365 and 260, in dose-dependent manner. It was also revealed that there is high correlation between the degree of tachyphylaxy and degree of inhibition. Therefore, this tachyphylaxy may be mediated by CCK-B receptors. L-365 and 260 dominantly affect the respiratory rate. This suggests that tachyphylaxy of AS may not result from deletion of endogenous opioid, but from activation of CCK receptors by excitation of thin-fiber muscular afferent nerve which modulates respiratory rate. The acute administration of amiodarone, an antiarrhythmic agent, was studied and the data was compared with chronic administration. The ventricular myocytes were isolated from rabbit hearts, perfusated with perfusate containing amiodarone, and action potential was measured under steady stimulating frequency. As a result, Action Potential Duration (APD) was shortened by amiodarone acute administration, and this did not depend on the stimulating frequency. The previous study demonstrated that APD was remarkably prolonged by chronic administration of amiodarone. Therefore, electrophysiologically reverse effects were observed in rabbit ventricular myocytes by the two administration methods. In respect to ion current, amiodarone acute administration interfered Na current and Ca current, and the suppression of these inward currents may result in the shortening of APD. In addition, transient outward current induced by repetitive depolarization was not affected by amiodarone acute administration, whereas it was decreased by chronic administration. Author (NASDA)

The purpose was to examine the change of Na current by lidocaine and disopyramide using concentration-clamp method, and to consider how the drugs bind the channel protein. The ventricular myocytes were isolated from guinea pig hearts and the Na current was measured using whole-cell clamp method. As a result, Na current was interfered slowly, at the time constant of 10 seconds, when disopyramide was added extracellularly. In case that lidocaine was added, Na channel was blocked by two steps; one is rapid block with the time constant of less than 0.1 seconds, and another is slow block that reached steady state for 60 to 120 seconds. The concentration of both drugs were so high that the Na current suppression depended not on electric potential or stimulating rate, but on binding the drug with the channel protein. If binding site of lidocaine presents on the only outer surface of the cell membrane, the time constant can be expressed using binding constant (k) and dissociation constant (l) as the following formula; $1/(k(D) + l)$. In order to bind the channel protein, drugs must pass through a extracellular hydrophilic path as well as intermembrane hydrophobic path. This suggests that the slow time constant of disopyramide and lidocaine may correspond to the hydrophobic pathway, and the rapid time constant of lidocaine, to the hydrophilic pathway. MS-511, 1, 3-dimethyl 6-(2-(N-(2-hydroxethyl) 3-(4-nitrophenyl) propylamino) ethylamino) 2, 4-(1H, 3H)-pyrimidinedione hydrochloride, is a newly developed antiarrhythmic agent that can prolong the Action Potential Duration (APD) and effective refractory period mainly due to K channel blockage. The MS-551 was compared with sotalol and E-4031 in respect to prolongation of effective refractory period. Rabbit ventricular muscles were extracted, perfusated with perfusate containing MS-551, and the membrane potential was measured. As a result, MS-551 prolonged APD significantly at the concentration of 0.3 micro-M or more, without suppressing maximum upstroke velocity. The APD prolongation caused by sotalol and E-4031 showed remarkable reverse use-dependency within the range of 0.1 to 3.0 Hz of stimulus, whereas that by MS-551 showed diphasic rate-dependency. This suggests that MS-511 may suppress a different K channel from other drug suppression. Among various K channels in the myocytes, slow rectifying K channel may participate in the rate-dependent APD prolongation, and MS-551 may bind with the activated K channel because the effect emerged not at the first stimulating pulse but at the second pulse after a long pause. Avail: CASI HC A01/MF A04

The effect of newly developed Class 3 antiarrhythmic agents, E-4031 and MS-551 on electrophysiological property of myocytes, especially on action potential and transient outward current was examined. The ventricular myocytes were extracted from rabbit hearts, and membrane potential was measured using whole cell clamp method. As a result, Action Potential Duration (APD) was prolonged by E-4031 under low frequency stimulus in reverse use-dependent manner. On the other hand, MS-511 prolonged APD under high frequency stimulus in use dependent manner. However both drugs were similar in respect to APD prolongation without affecting maximum upstroke potential or action potential amplitude. In addition, they did not affect transient outward current that is an important factor to cause the notch in the first phase of the action potential and to regulate APD. Therefore, the APD prolongation by low frequency stimulus using E-4031 may not result from the effect on transient outward current. MS-511 prolongs APD with premature contraction which shows shorter coupling duration than E-4031, so that they may have different association and dissociation constants of drug and channel. Avail: CASI HC A01/MF A04

Class 1 drugs, such as Na channel blockers, were used for ventricular arrhythmia to lower the conductivity and excitability of the ventricle. Recently, it was revealed that the inhibition of conductivity caused reentry in the ventricle. The conduction and fiber orientation of ventricular epicardium surface when lidocaine or flecainide was added, in order to clarify the mechanism of arrhythmia caused by class 1 antiarrhythmic agents was examined. The ventricle was extracted from rabbit hearts, and the extracellular potential was recorded and mapped to draw isochronic lines of conduction on the surface. These lines became stable after 2 hours of perfusion, and drew ellipses extended to the longitudinal direction of the fibers (L-direction). Lidocaine inhibited the L-direction conduction at the stimulating frequency of 2.0 Hz or more, and flecainide showed the similar inhibition within the range of 0.2 to 3.0 Hz. These inhibitions augmented with increase of stimulating frequency. This rate-dependency may result from use-dependent block of Na channel. However, both lidocaine and flecainanide did not inhibit the conduction to the transversal direction of the fibers. Author (NASDA)

EFFECTS OF CLASS 3 ANTIARRHYTHMIC AGENTS, E-4031 AND MS-551 ON VENTRICULAR REPOLARIZATION IN ISOLATED RABBIT HEARTS [IEUSAGI SHINSHITSU NO SAI BUNKYOKU NI TAISURU KURASU 3 KOFUSEIMYAKUZAI E-4031 TO MS-551 NO SAYO] c51

Hirokazu Iwata, Ryoko Suzuki, Kaichiro Kamiya, Itsuo Kodama, and Junji Toyama *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 245-247 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

It is known that class 3 antiarrhythmic agents can prolong action potential duration and refractory period, however it is uncertain whether these effects are different by each ventricular site, or how these drugs modify the repolarization in the entire ventricle. The effects of newly developed class 3 drugs, E-4031 and MS-551, were examined by mapping the electric potential of the heart surface. The hearts were extracted from rabbits, and heart surface potential were recorded and conductivity was mapped using a distant bipolar electrogram. As a result, it was demonstrated that E-4031 had a different effect from E-4031 prolonged the APD (Action Potential Duration) mainly in the apex, and increased spatial inequality of repolarization, whereas MS-551 did not cause inequality of ADP and repolarization in the entire left ventricle. It is known that class 3 drugs prolong APD and refractory period by inhibiting three types of K current, i.e., slow rectifying K(+) current, inward rectifying K(+) current, and transient outward current. The channels of these current are distributed unequally on the heart surface. This may be the reason why ADP and E-4031 effect was different by the sites of ventricle. Author (NASDA)

Avail: CASI HC A01/MF A04

Electric coupling between a multicellular sample or isolated myocyte and an external circuit simulating a gap junction able to change the conductivity was examined, and the electric coupling between sinoatrial node and atrial muscle was reviewed. The external circuit was consist of a voltage converter connected with an amplifier with membrane potential to membrane current converter, which can couple certain cells with other cells or a membrane model that can change the conductance like gap junction. Using this system, two experiments were performed. In one experiment, sinoatrial node cells were connected with a membrane model, however, spontaneous exciting cycle, depolarization velocity of the fourth phase, and action potential duration were not modified by the membrane model. This is probably because of insufficient space clamp due to low input resistance of the cells. Another experiment was that a single atrial cell of a guinea pig was connected with recorded action potential of the sinoatrial node. As a result, the atrial cell was excited, and as conductance increased, the action potential became similar to action potential in the sinoatrial node. Therefore, it can be concluded that this system is useful for quantitative evaluation of the cell-to-cell interaction and cellular excitability by electric coupling between a cell and a membrane model. Avail: CASI HC A01/MF A04

Whether action potential by electrical field stimulation is affected by intercellular electrical interaction was examined. The right ventricular papillary muscles were extracted from guinea pig hearts, to which electrical field stimulation was given, and the upstroke phase of action potential was recorded, as well as the activation time was determined as a time to reach the maximum upstroke velocity (V(sub max)) for each phase. As a result, V(sub max) was similar to that of one-point stimulation at any part of the muscle, which was about half of the V(sub max) in a single cell. The activation time was dispersed within the range of approximately 2-3 msec. In this experiment, a two-dimensional sheet model was developed to simulate cell membrane with dispersed excitation stages. Using this model, it was revealed that when electrical field stimulation was given, the cells were not excited synchronously, but the excitation was propagated among cells. The change of field stimulation may vary the direction of conduction, and cause unequal excitation, because isochronic line of conduction was obviously changed according to the change of stimulus strength, and because there were sites that V(sub max) was changed largely by abrupt change of activation time. Therefore, it can be concluded that V(sub max) was affected by various intercellular interaction when electric field stimulation was given, so that V(sub max) should not be used as an index of availability of Na channels. Author (NASDA)

Avail: CASI HC A01/MF A04

Ro 22-9194 (R), (2R)-2-amino N-(2, 6-dimethylphenyl) N-(3-(3-pyridyl) propyl) propionamiade D-tartrate is a newly developed antiarrhythmic agent. In previous study, it was demonstrated that the effect was dependent on blockage of Na channels of myocytes, because the drug inhibited the maximum upstroke velocity (V(sub max)) in rate-dependent manner. The membrane potential dependency of Na channel blockage by Ro 22-9194 (R) was examined. Venticular myocytes were isolated from guinea pig hearts, membrane potential was clamped by the whole cell clamp method, and the membrane potential and V(sub max) was determined. From the relation between resting potential of a single cell and V(sub max), it was revealed that the membrane potential that decreases V(sub max) by 50 percent was lowered by .0 mV by adding 30 micro-M Ro 22-9194 (R). This suggests that the drug may bind inactivated Na channels. In order to examine the participation of Na channel in detail, clamp pulses were given, which can shift the Na channel to resting state to inactivated state via activated state, and the duration of inactivated state is changeable. When a single pulse was given, V(sub max) inhibition was apparently increased by prolongation of pulse duration, so that Na block may occur both in the upstroke phase and in the plateau phase. From the experiment using train pulses, it was revealed that Ro 22-9194 blocked Na channels in use dependent manner by repetitive activation, and the drug could bind both activated and inactivated channel. ELECTROPHYSIOLOGICAL EFFECTS OF AN ANTIARRHYTHMIC DRUG, MORICIZINE ON ISOLATED GUINEA PIG VENTRICULAR MUSCLES [KO FUSEIMYAKUYAKU MORISHIJIN NO MORUMOTTO SHINSHITSUKIN NI TAISURU DENKI SEIRIGAKUTEKI SAYO] **c51**

Kazuyasu Maruyama, Ryoko Suzuki, Takafumi Anno, Itsuo Kodama, and Junji Toyama *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 259-261 In JAPANESE (For primary document see N94-27442 07-52)
Avail: CASI HC A01/MF A04

Moricizine is an oral antiarrhythmic agent that has an effect to block Na channel. Rate-dependent and membrane potential-dependent Na channel inhibition by moricizine using maximum upstroke velocity (V(sub max)) as an index was studied. The right papillary muscles were extracted from guinea pig hearts, and the action potential was recorded when electric stimuli were given. As a result, moricizine decreased the V(sub max) in dose-dependent manner without affecting the resting potential at the concentration of 1 micro-M or more. The concentration to inhibit the V(sub max) by 20 percent (IC(sub 20)) was 1.3 micro-M under basic stimulus of 1 Hz, and under three or more micro-M, the action potential duration was shortened significantly. These results suggest that main effect of moricizine on cardiac muscles might depend on inhibition of Na channels. In case of train stimuli, V(sub max) was inhibited use-dependently, and the inhibition was augmented as the frequency of stimulus was increased. The recovery time constant and onset rate of Use-Dependent Block (UDB) were similar to flecainide that shows slow Na channel blockage. From experiments using isolated ventricular myocytes, V(sub max) was decreased significantly when the duration of 0 mV conditioning clamp was prolonged to 400 msec or more, and the longer the duration was prolonged, the more the V(sub max) decreased. 0 mV conditioning clamp shifts Na channel from resting state to inactivating state via activating state. From these results, it can be concluded that moricizine may have high affinity to inactivated Na channel. Author (NASDA)

CORRELATION BETWEEN ELECTRICAL ACTIVITY AND THE SIZE OF SINGLE SINOATRIAL NODE CELLS [DOBO KESSETSU HOCHODORI SAIBO NO OKISA TO DENKITEKI TOKUSEI TONO KANKEI] **c51**

Haruo Honjo, M. R. Boyett (Leeds Univ., England.), Itsuo Kodama, and Junji Toyama *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 262-265 In JAPANESE (For primary document see N94-27442 07-52)
Avail: CASI HC A01/MF A04

In the sinoatrial node, various sizes of pacemaker cells are present. The purpose is to compare the cell size with spontaneous action potential pulses and ion current densities in pacemaker cells. The sinoatrial myocytes were isolated from rabbit hearts, and the cells which contract spontaneously were clamped by the whole cell clamp method. The action potential was recorded and membrane current was measured under membrane potential clamp. As a result, there was correlation between the size of these cells and spontaneous action potential; i.e., the small cells showed shallow maximum diastolic membrane potential and low maximum upstroke velocity and diastolic depolarization velocity compared by the large cells. In addition, small cells tended to be slow in spontaneous excitation. It is known that small cells present in the central part of the sinoatrial node, so that pacemaker cells in the central sinoatrial node may have shallow maximum diastolic potential, slow maximum upstroke velocity and diastolic depolarization velocity, and slow spontaneous activity. In respect to correlation between ion current density and cell size, no significant correlation was observed between the density of L-type Ca current and cell size, however, the density of non-selective current activated by hyperpolarization tended to augment the large cells. Therefore, this current may participate in rapid spontaneous activity and diastolic depolarization velocity in larger cells. Author (NASDA)

Acetylcholine (Ach) has a negative chronotropic effect on the heart due to suppressing automatism of the pacemaker in the sinoatrial node. How selective inhibition of ion channels can influence the Ach negative chronotropic effect was examined. The sinoatrial myocytes were isolated from rabbit hearts, and spontaneous cycle length was measured. In order to distinguish Ach effects on K current and on non-selective current activated by hyperdepolarization, each current was inhibited selectively using Ba(2+) and Cs(+); 0.5 mM Ba(2+) can inhibit K current by 80 - 0 percent, and 1 mM Cs(+) can inhibit the non-selective current by 50 - 60 percent. Both inhibitors do not affect other currents. A 1 mM Cs(+) did not show any effect on spontaneous excitation rate of the sinoatrial node, and on inhibition by Ach. This suggests that the negative chronotropic effect of Ach is not related to the non-selective current. On the other hand, although 0.5 mM Ba(2+) did not affect the spontaneous excitation rate when Ach was not present, it suppressed the Ach effect on spontaneous excitation. Therefore, the K current may participate in negative chronotropic effect of Ach. Author (NASDA)

The inhibition of automatism and change of membrane potential pulses in multicellular samples under wide range of Acetylcholine (Ach) concentration using selective inhibitors of channels associated with Ach was studied. Small sinoatrial node tissues were extracted from rabbit hearts, and perfused with perfusate containing Ach, Ba(2+), or Cs(+). Ba(2+) was used as a selective inhibitor of Ach sensitive K current (I(sub k)), and Cs(+), as a inhibitor of inward current activated by hyperdepolarization (I(sub f)). As a result, 2 mM Cs(+) decreased spontaneous excitation rate by 12.8 percent, while 2 mM Cs(+) did not affect the negative chronotropic effect of Ach; i.e., the dose-response curve and IC(sub 50) (the concentration inhibiting Ach effect by 50 percent) was not changed by Cs(+) addition. This implies that I(sub f) may not play an important role in pacemaker function, and that the negative chronotropic effect by Ach may not be associated with I(sub f). 0.5mM Ba(2+) prolonged the action potential duration, and decreased the maximum diastolic potential by 8-10 mV, as well as slight promotion of spontaneous excitation was observed. This is probably because of decrease of slow rectifying K current, and partially due to decrease of I(sub f) current secondary to the depolarization. In addition, Ba(2+) shifted the dose-response curve of Ach to the right, and increase IC(sub 50) (Ach) 3.5 times, which implies that Ach effect was inhibited. Therefore, the negative chronotropic effect of Ach may be caused by the activation of K current. Author (NASDA)

Avail: CASI HC A01/MF A04

In a previous study, it was demonstrated that the negative chronotropic effect of Acetylcholine (Ach) on sinoatrial node was owed to activation of K current (I(sub k)) rather than inward current activated by hyperpolarization (I(sub f)). The negative chronotropic effect of Ach released from postganglionic vagal ending on the entire sinoatrial node was studied. The sample tissues extracted from rabbit hearts were stimulated by electric field stimulus, and the response disappeared when atropine was added. Therefore, this response may be caused by binding muscarinic receptor with Ach released from postganglionic vagal ending. The vagal nerves responded with three phases; early automatism inhibition, secondary post-inhibitory rebound, and late artomatism inhibition. The post-inhibitory rebound can not be explained by the shift of pace-making site to other site in the sinoatrial node, because there is a finding that the post-inhibitory rebound was observed after the pacemaker site returned to the original site. When Cs(2+), an inhibitor of I(sub f), was added, the post-inhibitory rebound disappeared or decreased, which implies that automatism may be promoted by I(sub f) activation following hyperpolarization in vagal endings. Although Cs(2+) did not change the relation between early automatism inhibition and vagal stimulus compared with control, Ba(2+) decreased the negative chronotropic effect. It can be concluded that I(sub k) may play a more important role than I(sub f) in the negative chronotropic effect by Ach. Author (NASDA)

This study was performed as a part of a three-year project of international comparison of human behavior and psychology under extremely isolated environment, advocated by the Scientific Committee on Antarctic Research (SCAR) to Canada, Italy, Australia, France, and Japan. The subjects were 31 Japanese male members of the 32nd Antarctic wintering party, consisting of 16 observation members and 15 construction members. The age was ranging from 25 to 45, and the average age was 33.9. The duration was from November 1990 to March 1992. This test can be divided into two phases. The first phase was the test using questionnaires that was delivered to each members who were told to answer it within one week. Although this test was not compulsive, the recovery rate was as high as 1.3 percent. Another test was observation of particular members in some opportunities where every member was present at one time, such as meetings or dinner. In this test, the behavior, conversation, and others were recorded. These data are being analyzed now, and are scheduled to be compared at the international working group next year. What was interesting in this test was apparent contrast between observation members and construction members. Construction members answered to try external self-control rather than internal self-control when self-control was required, and included many inadaptable members. Author (NASDA)

INTERHEMISPHERIC PHASE RELATIONSHIP OF ALPHA WAVES AND CEREBRAL DOMINANCE [ARUFAHA NO HANKYUKAN ISO RENKAN TO HANKYU YUISEI] c53

Takako Kawaguchi, Hiroyasu Jijiwa (Institute for Developmental Research, Kasugai, Japan.), and Satoru Watanabe *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 279-281 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

In previous studies, phase of alpha wave was compared between the right and left hemispheres during loading mental work. Whether the interhemispheric difference could be changed by linguistic load and acoustic load was examined. The subjects were healthy 20 students. They sat relaxed with closed eyes, and brain waves were recorded, during the following two mental loadings; one is 10 questions on proverbs previously recorded by a cassette tape recorder, and another was to sing or follow seven musics in mind. The music included three children's songs with words and four melodies without words. As a result, the phase of alpha waves were significantly increased in temporal and frontal regions under linguistic loads and in temporal regions under acoustic loads, compared with those during closed-eyed relaxation. The time ratio of preceding phase in the left hemisphere to the right hemisphere was significantly larger in the temporal, frontal and central regions under linguistic loading, whereas it was not changed during acoustic loading and relaxation. This suggests that the left hemisphere of the brain may have a function of the linguistic process. No significant interhemispheric difference was observed between the music with and without words. Avail: CASI HC A02/MF A04

Phosphene is a sense obtained by electric stimulus of eyeball, and it can be applied as an evoked potential in the brain. The basic pulses of EER (Electricaly Evoked Response) and responses of a single neuron in the area 17 and 18 of the cerebral cortex were studied. The subjects were cats whose cerebral cortex was exposed, and extracellular potential was recorded. 54 units of cortex neurons were identified in the area 17, including 41 simple cells and 13 complex cells, and, 48 units, in the area 18. It is known that discharge occurs corresponding to two negative waves in Lateral Geniculate Neurons (LGN); i.e., latency ms (N1) and latency 20 ms (N2) stimulus. As a result of neuronal responses in the area 17, simple cells discharged by either N1, N2 or N1 and N2, and the response was less periodical compared with LGN, while the complex cells tended to slightly respond to the N1 and N2 stimuli. In the area 18, a few neurons discharged by the N1 stimulus, and no neuron could respond to both N1 and N2 stimuli. However, the neurons discharging by 30 ms or more stimulus presented in the area 18. In addition, by stimuli of 20 ms or more given twice at the interval of 20 ms, the responses were inhibited, which implies that these responses may be mediated by multiple synapses in the cortex, and the responses to 20 ms of stimuli may be a single synaptic response. IMPAIRED ASSOCIATED MOVEMENT IN PARKINSON'S DISEASE: AN EVALUATION OF BELL'S PHENOMENON [PAKINSONBYO NI OKERU RENGO UNDO SHOGAI: BERU GENSHO NI TSUITE NO KENTO]

Minoru Hoshiyama, Satoru Watanabe, Seiji Yoshino (Suzuka Univ. of Medical Science and Technology, Japan.), and Kaneo Mori *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 288-291 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

One of the dyskinesia in Parkinson's disease is a kinesia with impaired associated movement. This impairment includes Bell's phenomenon which is an upward movement of eye balls accompanied with eye close movement. The purpose is to observe the Bell's phenomenon in patients with Parkinson's disease. The subjects were seven patients with Parkinson's disease and eight healthy persons in the similar ages, who sat in resting position, with the head fixed, and closed the eyes while gazing at the front. Movement of eye ball and eye lid was recorded by an Electrooculogram (EOG). As a result, the Bell's phenomenon was observed in both groups. However, vertical movement of eye balls was significantly smaller in movement angle and the maximum angle in patient group, although no difference was observed in horizontal movement and distance of eye lid movement between both groups. There was a correlation between distance and velocity of eye lid movement in both groups, which implies that the duration of close eye movement was constant. In addition, duration from the beginning to the end of upward movement of eye ball was not different between two groups. Therefore, the difference of upward movement of eye balls could result from the difference of eye movement velocity. Author (NASDA)

HYPERALGESIA TO COLD IN PATIENTS WITH SUBACUTE MYELO-OPTICO-NEUROPATHY (SMON) [SUMON KANJA NO HIFU TSUKAKU KABIN: SAMO TESUTO NI YORU KENTO]

Yoshiki Sugiyama, Satoshi Iwase, Tadaaki Mano, Yasuo Koike, Kimiya Sugimura, and Akira Takahashi *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 292-294 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

In previous studies, it was demonstrated that hyperalgesia was manifested by ischemic block in the brachium. Blocking for 2 minutes causes spontaneous discharge of myelinated thick-fibers, resulting in tingling pain, and in case of blocking more than 10 minutes, dull pain hypersensitive to coldness occurred at the level of less than the threshold stimulus probably due to excitation of unmyelinated fibers, both of which are similar to the pain in a patient with Subacute Myelo-Optico-Neuropathy (SMON). The functional disorder of myelinated thick-fibers and afferent thin-fibers in hyperalgesia observed in SMON were examined. The subjects were 17 patients with SMON, to whom caloric stimulus and vibration were given. As a result, hyperalgesia by vibration was observed in seven cases, and thermoparesthesia was eight cases in the hand and nine cases in the thigh. What is interesting was abnormal sensitivity to coldness was observed in 11 cases. The threshold of these stimuli was within the non-pain range, and the response has a property of secondary pain with sense of ardor. These results suggest that hyperalgesia in SMON may be mediated by unmyelinated fibers. Author (NASDA)

CONTRIBUTION OF MUSCLE SPINDLE AFFERENT ACTIVITY TO TRANSIENT PAUSE IN EMG DURING VOLUNTARY TONIC CONTRACTION [JIZOKUSEI KIN SHUSHUKUCHU NI MIRARERU KIN HODEN NO KYUSHI NI KAKAWARU KIN BOSUI KYUSHINSEI HASSHA KATSUDO]

Reiko Tsukahara, Hisashi Aoki (Institute for Developmental Research, Kasugai, Japan.), Kyonosuke Yabe, and Tadaaki Mano *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 295-298 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

The purpose of this study is to examine how discharge of afferent fibers contributes to the pause emerging incidently in electromyogram (EMG) during voluntary tonic contraction. The subjects were five healthy adults, who lied in the prone position with isometric plantar flexion, and EMG and electroneurogram were recorded to identify afferent discharge of muscle spindle and Golgi tendon organ. As a result, the afferent discharge of muscle spindle was paused or grouped before muscle discharge paused. The muscle spindle afferent discharge was not relevant to restart of muscle discharge, at least through spinal reflex pathway. In addition, although discharge of muscle spindle tended to group before pauses of muscle discharge, the tendency disappeared after the pauses. The EMG of Golgi tendon organ revealed that discharge was decreased during muscle discharge pause as well as before restart of muscle discharge. This suggests that decrease of inhibitory stimulus from Golgi tendon organ may contribute to muscle discharge after the restart. Author (NASDA)

FUNCTION OF SELECTIVE ATTENTION INTRINSIC TO THE SACCADE SYSTEM: DOES THE VOLUNTARY CONTROL OVERRIDE THE STIMULUS DRIVEN CONTROL? [SAKKADO SHISUTEMU NI NAIZAISURU SENTAKUTEKI CHUI KINO: ZUIITEKI SEIGYO WA SHIGEKI KUDO SEIGYO OSEISURUKA] c53

Hiromi Imai and Kazuo Koga (Nagoya Univ., Japan.) *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 299-303 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

From many studies on spatial attention, it was revealed that subjects can maintain selective attention to a particular target with ignoring distractors. However, the mechanism of this selective attention is not understood. The purpose of this study is to examine which is the dominant control, voluntary control or stimulus driven control, and, in the case that one control was dominant, whether the other control could affect the control or not. Three subjects were told to gaze at a target dot on a display and to ignore a distractor that appeared after a short interval, and the horizontal movement of the left eye was recorded. As a result, saccade to the targets was mainly observed, and the distractor scarcely caused saccade even in emergence immediately after the emergence of the target. This suggests that voluntary control may override stimulus driven control. However, because duration from emergence of target to occurrence of saccade was prolonged by a distractor, the presence of a distractor may interfere with saccade programming to some extent. Avail: CASI HC A01/MF A04

It is known that skin sympathetic nerve activity causes vasoconstriction and decrease of skin blood flow. This study examined the effect of a peripheral vasodilator, Prostaglandin E1 (PGE1), on the skin sympathetic nerve activity. The subjects were five healthy male adults to whom skin sympathetic nerve activity burst was induced by several stimuli with or without PGE1, and the nerve activity and skin blood flow were recorded. It had been proved that there is a positive correlation between the intensity of the nerve activity and decrease of skin blood flow. In this study, it was demonstrated that PGE1 does not change the blood flow in resting condition, while it inhibites vasoconstriction in a dose-dependent manner under such stimuli as to cause burst activity in skin sympathetic nerve. These results suggest that it may be useful to test sympathetic nerve activity pharmacologically for examination of the vasoconstrictive action of drugs. Author (NASDA)

DIFFERENCE IN SKIN BLOOD FLOW REDUCTION DEPENDING ON ACTIVATING MANEUVER OF SKIN SYMPATHETIC NERVE ACTIVITY [KAKUSHU HIFU KOKAN SHINKEI KATSUDO FUKATSUKAHO GA MASSHO HIFU KETSURYURYO GENSHO NI OYOBOS EIKYO]

Satoshi Iwase, Yoshiki Sugiyama, Toshiyoshi Matsukawa, Chihiro Miwa, and Tadaaki Mano *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 309-313 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

It is known that activity burst can be induced in skin sympathetic nerve by various stimuli. This study examined the change of skin blood flow during occurrence of the activity burst to reveal the participation of activity burst in vasoconstrictive and sweating effect of sympathetic nerve. The subjects were four healthy male adults, to whom activity burst was induced by mental arithmetic, acoustic stimulus, electric stimulus, and sudden and deep inspiration, while skin nerve activity, skin blood flow, and sweating were measured. As a result, linear relation was observed between skin sympathetic nerve activity and reduction of blood flow, when activity burst was induced by mental arithmetic, acoustic stimulus, electric stimulus, or in resting condition. Under activity burst by deep breathing, reduction of blood flow was larger than other stimuli. The stimuli, such as acoustic or electric stimulus, can activate the sympathetic nerve system via the cerebral cortex, while inspiratory stimulus activates afferent vagus nerve directly through Hering-Breuer reflex. These results indicate that the decrease of skin blood flow was larger when the response was mediated by afferent vagus nerve via Hering-Breuer reflex than mediated through cerebral cortex. Therefore, the activation via afferent vagus nerve may stimulate vasoconstrictive activity more vividly during skin sympathetic nerve activity. Author (NASDA)

EFFECT OF L-DOPA ON HEMODYNAMIC FUNCTIONS IN HUMANS [L-DOPA GA HITO NO JUNKAN DOTAI NI OYOBOSU EIKYO]

Shigeo Takeuchi, Yoshiki Sugiyama, Satoshi Iwase, Tadaaki Mano, Toshiyoshi Matsukawa, and Reiko Tsukahara *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 314-320 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A02/MF A04

L-dopa often causes orthostatic hypotension in patients with Parkinson's disease. This study examined the effect of L-dopa on human circulatory system to clarify the mechanism of this adverse reaction. The subjects were eight healthy adults, who lied in supine position on a tilting bed which was inclined 20, 40, and 60 degrees for head-up tilt before and after administration of L-dopa. To evaluate cardiovascular functions, the associated cardiovascular parameters and sympathetic nerve activity were measured. As a result, burst activity of muscle sympathetic nerve was increased significantly in every tilt by L-dopa administration, so that the effect of L-dopa may result from inhibition of sympathetic nerve activity at the peripheral level. This is supported by the fact that the increase of muscle sympathetic nerve activity was lowered by L-dopa as flow resistance in the leg was increased during tilting. Therefore, L-dopa may cause vasodilation or inhibit vasoconstriction at the peripheral level. Flow resistance was significantly decreased at 60 degrees tilt after L-dopa administration, probably because decrease of blood pressure by peripheral vasodilation surpasses central sympathetic nerve activity. Author (NASDA)

SYMPATHETIC NERVE ACTIVITY DURING DYNAMIC LEG EXERCISE [DOTEKI KYAKU UNDOJI NO KOKAN SHINKEI KATSUDO]

Mitsuru Saito and Tadaaki Mano (Nagoya Univ., Japan.) *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 321-324 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

It has been suggested that sympathetic nerve activity may be affected by the muscles that participate in the motive activity and by exercise patterns. The purpose of this study is to observe sympathetic nerve activity during dynamic leg exercise that increased oxygen consumption up to 70 percent of the maximum oxygen consumption. The subjects were five healthy male adults, 22 to 27 years old, who were loaded with an ergometer by four stages; i.e., Warming-up stage (W-Up), load less than anaerobic metabolic threshold, load corresponding to anaerobic metabolic threshold, and load more than anaerobic metabolic threshold, and sympathetic nerve activity, heart rate, blood pressure, and electromyogram (EMG) of femur muscle surface were recorded. As a result, the heart rate, EMG, and blood pressure were all increased as the load increased. As an index of sympathetic nerve activity, discharge burst rate (BR) was determined by the number of peak bursts from the analysis of muscle sympathetic nerve activity, which indicated that BR was once decreased in W-Up, then increased linearly as the exercise load was increased. In other words, sympathetic nerve activity was increased in heavy exercise, although it was suppressed in light exercise. Author (NASDA)

ANALYSIS ON ONE MINUTE WAVE IN BODY FLUID VOLUME AND MUSCLE PUMPING REFERRED TO BODY PARTS GENERATING THE ONE MINUTE WAVE DURING HUMAN ACTIVE STANDING [HITO NO NODOTEKI SEISHI RITSUI NI OKERU TAIEKIRYO HENDO ICHI FUNHA NO HASSEI BUI OYOBI SONO ICHI FUNHA TO KIN PONPU SAYO TONO KANKEI]

Kinsaku Inamura, Tadaaki Mano, and Satoshi Iwase *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 325-330 In JAPANESE (For primary document see N94-27442 07-52)

Avail: CASI HC A02/MF A04

It is known that muscle pumping and sympathetic nerve response can regulate one-minute waves that are generated by automatic vasoconstriction in venous blood congestive sites in order to circulate congestive blood. The purpose of this study is to reveal the generating site and propagation of one-minute waves in active standing by measuring body fluid volume and surface electromyography in detail, and to reveal the relationship between muscle pumping and one-minute waves in body fluid volume. The subjects were 14 healthy adults, 18 to 20 years old, who maintained active standing for 40 minutes, and circumferences of each body parts, electromyograms, and foot pressure centers were measured. As a result, it was revealed that the one-minute waves in body fluid volume were generated not only in the lower thigh but also in the abdomen and upper thigh and propagated upwards. The one-minute waves were generated at one site each in the lower thigh, upper thigh, and upper body, and they were usually observed in the soleus muscle, central calf, upper thigh, and navel and stomach level of the abdomen. In addition, as soon as muscle constriction occurred, one-minute waves were observed on this site, and the wave was coupled with one-minute wave of foot pressure center resulting from body sway in active standing. This implies that the muscle pumping caused by body sway may circulate blood by one-minute waves in body fluid volume. Author (NASDA)

AN ATTEMPT OF INTRANEURAL STIMULATION BY MICROELECTRODE INSERTED IN SKIN SYMPATHETIC NERVE FASCICLE [BISHO DENKYOKU NI YORU HIFU KOKAN SHINKEINAI SHIGEKI NO KOKOROMI]

Junichi Sugenoya, Satoshi Iwase (Nagoya Univ., Japan.), Yoshiki Sugiyama (Nagoya Univ., Japan.), and Tadaaki Mano (Nagoya Univ., Japan.) *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 331-334 In JAPANESE (For primary document see N94-27442 07-52)
Avail: CASI HC A01/MF A04

Recently, microelectrode techniques have enabled selective stimulation of a nerve by inserting a stimulating electrode into the target nerve fascicle percutaneously. In this study, a new technique was attempted using a microelectrode to stimulate skin sympathetic nerve selectively. The subjects were four healthy male adults, to whom a microelectrode was inserted into the tibial nerve percutaneously, and skin sympathetic nerve activity (SSNA) was recorded. Sweating and skin blood flow were also recorded in the soles which have effecters of the tibial nerve. Before insertion, the nerve was blocked by lidocaine at 5 cm proximal from the insertion site, and stimulated with various strengths of current, duration, and stimulating patterns. Although the nerve was not blocked completely, the latency of sweating response was shortened by 1.5 seconds when stimulated, which indicates that the electrode directly stimulated the sweat controlling nerve. This response was increased by repetitive stimuli. In addition, the more the current strength was, the more the sweating responses became. Even when the stimulus was so weak that sweating response did not occur, it tended to occur by repetitive stimuli with more frequent cycle. The latency tended to be shortened when large response occurred by strong stimulus. However, no change was observed in skin blood flow. Author (NASDA)

THE MEASUREMENTS OF MUSCLE BLOOD FLOW BY LASER DOPPLER FLOWMETRY WITH NEEDLE TYPE PROBE [HARIGATA PUROBE O MOCHIITA REZA DOPPURA KETSURYURYOKEI NIYORU KIN SOSHIKI KETSURYURYO NO SOKUTEI] c51

Kiyohito Yamamoto, Yasuhiro Oba, Tadaaki Mano, and Shigehiko Shionoya *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 335-339 In JAPANESE (For primary document see N94-27442 07-52)
Avail: CASI HC A01/MF A04

Laser Doppler velocimetry is an easy method to measure continuous skin blood flow. However, for muscle blood flow measurement, the probe must touch directly to the operationally exposed muscle, and the performance has not been determined yet. The newly developed needle type probe for laser Doppler velocimetry can be inserted into the target muscle without operation, so that simple and continuous measurement of muscle blood flow might be achieved. In order to examine this possibility, the laser Doppler velocimeter was compared with an ultrasonic velocimeter in respect to suitability of continuous measurement and reproducibility. The subjects were three dogs, in which an ultrasonic velocimeter was equipped to the popliteal artery, and a laser Doppler velocimeter was inserted into the musculus gastrocnemius, and blood flow was varied by papaverin and reactive hyperemia. As a result, there was a linear relationship between measurements of the two velocimeters when blood flow increased, whereas when blood flow decreased, no linear relationship was observed between the two methods. However, in short-period blood flow decrease, the two methods were correlated positively, although the incline was different between papaverin and reactive hyperemia. These results suggest that the laser Doppler velocimeter could be useful to measure muscle blood flow with high reproducibility; however the measurements should be evaluated as relative values. Clinical manifestations of hyper- and hypothyroidism are similar to those of hyper- and hypoactivity of sympathetic nerves. In order to clarify the relation between muscle sympathetic nerve activity (MSNA) and thyroid function, action potential of sympathetic nerve was measured directly using microneurography, and the data were compared with control and patients with hyper- and hypothyroidism. The subjects were eight healthy persons, six patients with hyperthyroidism, and six patients with hypothyroidism. Blood pressure, cardiac rate, and MSNA were measured and at the same time free triiodothyronine (F-T3), free thyroxine (F-T4), and thyroid-stimulating hormone (TSH) in venous blood were determined. As a result, it was revealed that sympathetic nerve was hyperactive in patients with hypothyroidism, while it was hypoactive in patients with hyperthroidism. In addition, there was a negative correlation between thyroid hormone concentration and MSNA, probably because thyrotropin releasing hormone (TRH) that can activate MSNA may be lowered in hyperthyroidism, and increased in hypothyroidism. Moreover, this negative relation may be relevant to beta-receptor which can be increased in number and affinity by thyroid hormone. Author (NASDA)

ENHANCEMENT OF SKIN SYMPATHETIC NERVE ACTIVITY IN AMYOTROPHIC LATERAL SCLEROSIS [KIN ISHUKUSEI SOKUSAKU KOKASHO NI OKERU HIFU KOKAN SHINKEI KATSUDO NO KENTO]

Koji Yamamoto, Gen Sobue, Satoshi Iwase (Nagoya Univ., Japan.), Tetsuya Okamoto (Nagoya Univ., Japan.), Tadaaki Mano (Nagoya Univ., Japan.), and Terunori Mitsuma *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 343-347 In JAPANESE (For primary document see N94-27442 07-52)
Avail: CASI HC A01/MF A04

Amyotrophic lateral sclerosis (ALS) is a disease that degenerates motor neurons systematically. Several studies suggest that sympathetic nerve activity may be activated in ALS patients. The purpose of this study is to examine the skin sympathetic nerve activity (SSNA) in ALS using microneurography. The subjects were five patients with ALS and 10 healthy adults, to whom a microelectrode was inserted into the efferent sympathetic nerve, tibial nerve, and SSNA was determined using burst activity as an index. Blood flow and sweating were measured in the sole, an effector of the efferent nerve, during rest and sympathetic nerve stimulation. As a result, SSNA was higher in patients with ALS than the control group in rest. However, under stimulation, SSNA was not changed in ALS patients, whereas it was activated in the control group. This implies that the sympathetic nerve was hyperactivated in ALS patients. There were individual differences in SSNA among ALS patients. Whether these differences may be associated with individual severity or stages of the disease cannot be determined because only a few subjects participated in this study.

Orthostatic hypotension (OH) is an important symptom in patients with autonomic disorder; however, definitive treatment has not established yet.

The purpose of this study is to examine the effect of two drugs, arginine vasopressin (AVP) and lysine vasopressin (LVP), on OH. The subject was a 41 year-old male patient with multisystemic atrophy presenting marked OH, to whom orthostatic load was applied by a tilting bed, and the blood pressure and heart rate were measured before and after the loading. The load was also applied after nasal administration of AVP and LVP. In resting, blood pressure was significantly increased by AVP and LVP. Under orthostatic load, the subject complained of the symptoms of OH at the incline of 70 degrees without AVP or LVP, whereas such symptoms did not appear after administration of AVP or LVP, and blood pressure was improved in each incline. Unpublished data revealed that AVP increased the blood pressure in patients with OH or post-prandial hypotension, although it did not affect the blood pressure of healthy subjects. These results suggest that patients with autonomic disorder may be supersensitive to vasopressin, which may be a reason for effectiveness of AVP on OH.

ACTIVATION BY G PROTEIN BETA GAMMA SUBUNITS OF G PROTEIN-COUPLED RECEPTOR KINASE [G TANPAKUSHITSU KYOEKI JUYOTAI KINAZE NO G TANPAKUSHITSU BETA GANMA SABUYUNITTO NI YORU KASSEIKA]

Tatsuya Haga, Kazuko Haga, Kimihiko Kameyama, and Hiroko Nakata *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 352-354 In JAPANESE Presented at the 13th Symposium on Environmental Medicine, Aichi, Japan, 11 Nov. 1992; sponsored by Research Inst. of Environmental Medicine (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

This study examined the regulation of G protein-coupled receptor kinase by G protein. Musucarinic acetylcholine receptor (mAChR) kinase purified from swine brains was proved to be able to regulate phosphorylation of muscarinic receptors by G protein; i.e., the mAChR kinase was activated by alpha, beta, and gamma subunits of G protein, and inhibited by beta and gamma subunits. The beta and gamma subunits also activated the phosphorylation of rhodopsin and beta-AR (adrenergic receptor), although it did not affect the activity of rhodopsin kinase. Comparing the beta and gamma subunits of G protein with beta and gamma subunits of transducin, the former activated mAChR, rhodopsin, and beta-AR in low concentration, while the latter showed low activation in high concentration. These results suggest that beta and gamma subunits of G protein may activate phosphorylation in general. The experiment to express cDNA (complementary deoxyribonucleic acid) of beta-AR kinase support that mAChR kinase may be identical with beta-AR kinase. Comparing the amino acid sequence between beta-AR and rhodopsin kinase, beta-AR was longer in the C-terminal with which beta and gamma subunits may interact. Therefore, it can be concluded that mAChR kinase could be an effector of G protein, and be activated by beta and gamma subunits. It is also suggested that beta and gamma subunits may promote desensitization of such a receptor kinase via phosphorylation. Author (NASDA)

POSTNATAL CHANGES IN THE AUTONOMIC MODULATION OF L-TYPE Ca(EXP 2+) CURRENTS OF RABBIT VENTRICULAR CELLS [JIRITSU SINKEI NI YORU SHINKIN CA(2+) DENRYU SHUSHOKU KIKO NO SEIGO HENKA]

Toshiyuki Osaka and Ronald W. Joyner (Emory Univ., Atlanta, GA.) *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 355-361 In JAPANESE Presented at the 13th Symposium on Environmental Medicine, Aichi, Japan, 11 Nov. 1992; sponsored by Research Inst. of Environmental Medicine (For primary document see N94-27442 07-52)

Avail: CASI HC A02/MF A04

This article presents findings on postnatal development of autonomic modulation of L type Ca(2+) current, I(sub ca). Firstly, participation of beta-adrenergic receptor and muscarinic acetylcholine (mACh) receptor was examined in a single myocyte of adult rabbit (AD) and newborn rabbit (NB) using beta-agonist (isoproterenol (ISO)) and musucarinic agonist (carbacol (CCh)). As a result, ISO increased I(sub ca) to similar extent in AD and NB, while CCh inhibited the ISO effect more remarkably in NB than AD. Secondly, the effect of adenylate cyclase (AC) activator, forskolin (FOR), was examined in AD and NB, and it was revealed that FOR increased I(sub ca) to similar extent in AD and NB, and this increase was slightly inhibited by CCh in AD, while it was completely inhibited in NB. Thirdly, FOR effect was examined with presence of GTP (guamosine 5'-triphosphate) analog, 5'-guanulylimido diphosphate (GppNHp). As a result, FOR effect on I(sub ca) was slightly decreased by GppNHp in AD, while it was largely decreased in NB. Finally, pertussis toxin (PTX) that blocks interaction of mACh receptor and GTP binding protein, Gi, was used to examine the effect of both Gi activator, CCh and GppNHp, and Gi inactivator, PTX, on either ISO or FOR, and it was demonstrated that the effect was more remarkable in NB than AD. These results suggest that in immature hearts, AC is inhibited by parasympathetic nerve system via a tonic effect of Gi even when musucarinic agonist does not exist. Author (NASDA)

Avail: CASI HC A01/MF A04

This article outlines second messengers that regulates cardiac myocyte function via alpha and beta receptors, and the pathophysiological relevance to congestive heart failure. In respect to beta receptors, the mechanism to regulate cardiac function and relevance to heart failure has been considerably understood. Beta receptors which consist of beta 1 receptor and beta 2 receptor couple with G protein, Gs, and activate catalytic subunits (CS). The CS promotes cardiac function via second messenger, cAMP (adenosine 3', 5'-cyclic monophosphate). In patients with congestive heart failure, receptor down-regulation (R-DO) occurs by exposure to high level of catecholamine in blood, and lessen the number of beta-receptors on myocyte surfaces so that cardiac function is degraded. Beta receptor blockers can recover the number of beta receptors. In addition to R-DO, heart failure results from insufficient coupling with Gs, against which phospho diesterase-3 (PDE-3) inhibitor is used to increase intracellular cAMP. However, some reports recently presented data that such inhibitors increased mortality of severe heart failure patients. In respect to alpha receptors, the mechanism to regulate cardiac function seems so complicated that the relevance to congestive heart failure has not been understood well. It was revealed that cardiac alpha receptor may increase Ca(2+)(sub i) and sensitivity to Ca(2+) by prolongation of action potential due to decrease of transient outward current and activation of Na(+)/H(+) exchangers.

The most important effect of acetylcholine (Ach) on the heart is negative chronotropic effect that decreases heart rate by inhibiting autonomic activity of sinoatrial pacemaker. This article presents experimental findings on the desensitization of negative chronotropic effect by Ach. It is reported that the negative chronotropic effect is caused by three ion currents; i.e., activation of Ach sensitive inward rectifying K current, i(sub k, Ach), inhibition of L type Ca current, i(sub Ca), and non-selective current activated by hyperdepolarization, i(sub f). Therefore, it was examined which current participates in Ach desensitization, using a single sinoatrial myocytes of rabbit hearts with clamped membrane potential. As a result, i(sub k, Ach) was activated by Ach, then decayed biphasically, while Ach inhibited i(sub Ca) and i(sub f) under stimulation of beta receptor, but this inhibition did not decay. I(sub Ca) and i(sub f) are inhibited by decrease of cAMP (adenosine 3', 5'-cyclic monophosphate) resulting from adenylate cyclase suppression via inhibitory G protein. These results suggest that adenylate cyclase inhibition by Ach may not cause desensitization of ion currents, but that the desensitization may result from change of Ach sensitive K channels. MUSCLE SYMPATHETIC NERVE ACTIVITY IN HUMANS [KIN KOKAN SHINKEI KATSUDO]

Toshiyoshi Matsukawa *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 370-372 In JAPANESE Presented at the 13th Symposium on Environmental Medicine, Aichi, Japan, 11 Nov. 1992 (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

This article describes regulation of muscle sympathetic nerve activity by endogenous reflex, especially on measuring method of reflex function, and its relevance to essential hypertension. The endogenous reflex includes arterial baroreceptor reflex, cardiopulmonary baroreceptor reflex, arterial chemoreceptor reflex, and skeletal muscle chemoreceptor reflex. These reflexes sense changes of blood pressure, CO2 or O2 partial pressure, or pH by baroreceptors or chemoreceptors, and regulate them by negative feedback via sympathetic nerve activity. These reflexes are modified in patients with essential hypertension. From measurements of muscle sympathetic nerve activity (MSNA), it was revealed that occurrence and development of essential hypertension may be relevant to activation of MSNA. In young boundary hypertension patients, the arterial baroreceptor reflex was decreased, while cardiopulmonary baroreceptor reflex was increased. These contradictory results imply that the two reflexes compensate each other. In addition, arterial chemoreceptor reflex was increased probably due to decrease of arterial baroreceptor reflex. THE POLYMODAL RECEPTOR [PORIMODARU RESEPUTA] c51

Kazue Mizumura *In its* Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 373-374 In JAPANESE Presented at the 13th Symposium on Environmental Medicine, Aichi, Japan, 11 Nov. 1992 (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

The polymodal receptor is a noxious receptor that not only causes the sense of pain, but also affects autonomic functions, and is sensitized by inflammatory mediators. This article presents the findings on the sensitization of polymodal receptors examined by prostaglandin E2 (PGE2). The PGE2 scarcely causes discharge on polymodal receptor; however, it augments the discharge caused by Bradykinin (BK) or caloric stimulus in different concentrations. This suggests that the polymodal receptor has at least two binding sites for prostaglandin. Therefore, antagonists of each three subtypes of PGE receptors (EP1, EP2, and EP3) were added to the polymodal receptor, and it was revealed that EP3 receptor might participate in augmentation of BK effect, and EP2 receptor may be relevant to caloric stimulus. In order to identify the second messengers of these receptors, the relation between adenosine 3', 5'-cyclic monophosphate (cAMP) concentration and responses to BK and caloric stimulus was examined. As a result, BK response was slightly suppressed by increase of intracellular cAMP, which may imply that EP3 receptor inhibited adenylate cyclase via inhibitory G protein. On the contrary, the thermoresponse was obviously increased by cAMP increase, and it was also decreased by adenylate cyclase inhibitor, which supports the idea that cAMP participates in thermoresponse via PGE2 receptor. AUTONOMIC NERVOUS SYSTEM AND CARDIOVASCULAR CONTROL: CLINICAL IMPLICATIONS OF THE 1/f FLUCTUATIONS OF HEART RATE [JIRITSU SHINKEI NI YORU SHINZO CHOSETSU]

Kuniaki Otsuka and Haruo Watanabe *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 375-379 In JAPANESE Presented at the 13th Symposium on Environmental Medicine, Aichi, Japan, 11 Nov. 1992; sponsored by Research Inst. of Environmental Medicine (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

The 1/f fluctuation is observed extensively in nature, from the rhythm of music or vibration of vehicles to magnetic field of the galactic system. This article presents findings concerning the 1/f fluctuation of autonomic nerve activity. To examine the relation between heart rate and 1/f fluctuation, electrocardiograms were recorded and analyzed in healthy volunteers. Natural fluctuation includes 1/f fluctuation, white fluctuation, and 1/f(exp 2) fluctuation, which can be identified by incline of linear regression line of power spectral density against frequency. As a result, circadian rhythm was observed in 1/f fluctuation of healthy subjects, and the 1/f fluctuation gradually shifted to white fluctuation when subjects got older or in patients with Parkinson's disease. The same tendency was also observed in a patient with severe pseudo aldosteronism, in whom white fluctuation shifted to 1/f fluctuation as the patient recovered. These results support the notion that 1/f fluctuation may be a basic fluctuation of organisms. Author (NASDA)

THE ROLE OF BETA-ADRENOCEPTOR STIMULATION IN THE PROGRESSION OF CHRONIC HEART FAILURE [SHINFUZEN NO SHINTEN NI OKERU KOKAN SHINKEI BETA JUYOTAI SHIGEKI NO IGI]

Masatsugu Hori, Hideyuki Sato, Hiroshi Sato, and Takenobu Kamada *In* Nagoya Univ., Annals of the Research Inst. of Environmental Medicine, Nagoya Univ., Volume 44 25 Mar. 1993 p 380-383 In JAPANESE Presented at the 13th Symposium on Environmental Medicine, Aichi, Japan, 11 Nov. 1992; sponsored by Research Inst. of Environmental Medicine (For primary document see N94-27442 07-52)

Avail: CASI HC A01/MF A04

In heart failure, sympathetic nerve activity is activated in proportion to severity of the disease. This activation may be a compensatory mechanism in order to increase blood supply to muscles in motion by stimulating cardiac muscles. Norepinephrine released in sympathetic nerve activation stimulates beta-receptors to increase heart rate, stroke volume, and cardiac output, as well as alpha-receptor to increase blood pressure and blood supply. However, alpha-receptor stimulation also decreases renal blood flow, and beta-receptor stimulation activates renin, angiotensin, and aldosterone, which contradicts with cardiac alpha-receptor response in vasoconstriction. These excess sympathetic nerve activations may exacerbate heart failure by down-regulation of beta-receptor and destruction of microtubules. For these patients, beta blocker is chronically administered to protect cardiac muscles from excess catecholamine effects. In administration, it is important to start with a low dose and increase it little by little. Author (NASDA)

The present volume is a collection of 227 abstracts of radiation research sponsored by the NASA Space Radiation Health Program for the period 1991-1992. Each abstract has been categorized within one of three discipline areas: Physics, Biology and Risk Assessment. Topic areas within each discipline have been assigned as follows: Physics - Atomic Physics, Theory, Cosmic Ray and Astrophysics, Experimental, Environments and Environmental Models, Solar Activity and Prediction, Experiments, Radiation Transport and Shielding, Theory and Model Development, Experimental Studies, and Instrumentation. Biology - Biology, Molecular Biology, Cellular Radiation Biology, Transformation, Mutation, Lethality, Survival, DNA Damage and Repair, Tissue, Organs, and Organisms, In Vivo/In Vitro Systems,

Carcinogenesis and Life Shortening, Cataractogenesis, Genetics/ Developmental, Radioprotectants, Plants, and Other Effects. Risk Assessment - Risk Assessment, Radiation Health and Epidemiology, Space Flight Radiation Health Physics, Inter- and Intraspecies Extrapolation and Radiation Limits and Standards. Section I contains refereed journals; Section II contains reports/meetings. Keywords and author indices are provided. A collection of abstracts spanning the period 1986-1990 was previously issued as NASA Technical Memorandum 4270. Author

All types of blood cells are formed by differentiation from a small population of pluripotent stem cells in the bone marrow. This population should maintain the balance between self-renewal and differentiation, even under severe perturbations, e.g. the massive cell death caused by chemotherapy or irradiation. The authors constructed a cellular-automata model for bone marrow dynamics, which retrieves its homeostatic capabilities even under periodic perturbations with constant or random amplitude. However, temporally stochastic perturbations result in a chaotic-like behavior. Several methods of analysis failed to distinguish between the time series in this case and a chaotic time series, although the chaotic-like behavior has no deterministic source. DOE

A comparison of flight simulator control was made among three subject groups: Japan Air Self Defence Force (JASDF) personnel in their 20's, who had not applied to become pilots and are currently engaged in non-flight duties (Group 1); flight students (in their 20's) with only 4 hours of flight experience (Group 2); and non-pilots ranging in age from 28 to 48 (mean age, 38) (Group 3). The data-gathering flight patterns included seven segments. Each segment began from straight and level flight, proceeded to the aircraft maneuver in question, and ended in straight and level flight. The aircraft maneuvers were as follows: straight climb and descend for segment 1; right and left level turn for segment 2; left climbing turn for segment 3; right climbing turn for segment 4; left descending turn for Segment 5; right descending turn for Segment 6; and landing for Segment 7. As was expected, Group 3 performed the best overall. Author (NASDA)

A technique for measurement of cerebral oxygen status was evaluated on volunteer subjects in the Aeromedical Laboratory centrifuge. Eight males were exposed to a 0.1 G sec(exp -1) onset rate profile until grayout. By using near infrared oxygenation monitor, this instrumentation is capable of measuring the concentrations in the brain of oxygenated Hemoglobin (HbO2), reduced Hemoglobin (Hb), oxidized cytochrome aa(sub 3)-reduced Cytochrome aa(sub 3) (CtO2) and total Hemoglobin (BV, HbO2+Hb). Results showed changes within the brain, as generally expected, during increased Gz with reductions in HbO2 and BV. Hb and CtO2 measurements were inconclusive. There were high correlations (R = -0.95 +/- 0.02, n = 18) between the change of the cerebral HbO2 concentration and the +Gz value. This correlation may be used as a criterion of individual subject +Gz tolerance. Author (NASDA)

The signs and symptoms experienced by the 500 trainees who took the chamber flight training in 1990 at Tachikawa were reviewed. The trainees were asked to answer the questionnaire of 14 items and evaluate their hypoxic conditions into five grades of seriousness by themselves after hypoxia experience (maximum duration of 5 minutes). These data were evaluated in terms of the duties and ages of the trainees. The time during the trainee was without his oxygen mask was recorded as 'Time of Useful Consciousness (T.U.C.).' Occurrence of hypoxic signs and symptoms showed similar tendency regardless of their duties or ages. Each individual experienced more than four symptoms out of 12 items. The most common symptom was burning sensation (or hot flashes) that was complained by 85.8 percent of all trainees. This symptom is considered to be one of the important alarming signs for hypoxia since it appears in early stage. Judgment impairment was observed in 79.4 percent and visual disturbance was complained by 58.9 percent. Both of these problems are critical for controlling the aircraft. Average TUC was 2 minutes and 53 seconds. TUC of inexperienced trainees was approximately 1 minute longer than that of experienced trainees. This proves the effectiveness of repeating chamber training. Author (NASDA)

WORKSHOP ON COUNTERING SPACE ADAPTATION WITH EXERCISE: CURRENT ISSUES

Bernard A. Harris, ed. and Steven F. Siconolfi, ed. Feb. 1994 234 p
Workshop held in Houston, TX, 1989 Sponsored by NASA, Washington
(NASA-CP-3252; S-755; NAS 1.55:3252) Avail: CASI HC A11/MF A03

The proceedings represent an update to the problems associated with living and working in space and the possible impact exercise would have on helping reduce risk. The meeting provided a forum for discussions and debates on contemporary issues in exercise science and medicine as they relate to manned space flight with outside investigators. This meeting also afforded an opportunity to introduce the current status of the Exercise Countermeasures Project (ECP) science investigations and inflight hardware and software development. In addition, techniques for physiological monitoring and the development of various microgravity countermeasures were discussed. For individual titles, see N94-28362 through N94-28374.

MUSCULAR ACTIVITY AND ITS RELATIONSHIP TO BIOMECHANICS AND HUMAN PERFORMANCE

Gideon Ariel *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 1-97
(For primary document see N94-28361 07-52)
Avail: CASI HC A05/MF A03

The purpose of this manuscript is to address the issue of muscular activity, human motion, fitness, and exercise. Human activity is reviewed from the historical perspective as well as from the basics of muscular contraction, nervous system controls, mechanics, and biomechanical considerations. In addition, attention has been given to some of the principles involved in developing muscular adaptations through strength development. Brief descriptions and findings from a few studies are included. These experiments were conducted in order to investigate muscular adaptation to various exercise regimens. Different theories of strength development were studied and correlated to daily human movements. All measurement tools used represent state of the art exercise equipment and movement analysis. The information presented here is only a small attempt to understand the effects of exercise and conditioning on Earth with the objective of leading to greater knowledge concerning human responses during spaceflight. What makes life from nonliving objects is movement which is generated and controlled by biochemical substances. In mammals, the controlled activators are skeletal muscles and this muscular action is an integral process composed of mechanical, chemical, and neurological processes resulting in voluntary and involuntary motions. The scope of this discussion is limited to voluntary motion. Derived from text

ECCENTRIC EXERCISE TESTING AND TRAINING

Priscilla M. Clarkson *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 99-110 (For primary document see N94-28361 07-52)
Avail: CASI HC A03/MF A03

Some researchers and practitioners have touted the benefits of including eccentric exercise in strength training programs. However, others have challenged its use because they believe that eccentric actions are dangerous and lead to injuries. Much of the controversy may be based on a lack of understanding of the physiology of eccentric actions. This review will present data concerning eccentric exercise in strength training, the physiological characteristics of eccentric exercise, and the possible stimulus for strength development. Also a discussion of strength needs for extended exposure to microgravity will be presented. Not only is the use of eccentric exercise controversial, but the name itself is fraught with problems. The correct pronunciation is with a hard 'c' so that the word sounds like ekscentric. The confusion in pronunciation may have been prevented if the spelling that Asmussen used in 1953, excentric, had been adopted. Another problem concerns the expressions used to describe eccentric exercise. Commonly used expressions are negatives, eccentric contractions, lengthening contractions, resisted muscle lengthenings, muscle lengthening actions, and eccentric actions. Some of these terms are cumbersome (i.e., resisted muscle lengthenings), one is slang (negatives), and another is an oxymoron (lengthening contractions). Only eccentric action is appropriate and adoption of this term has been recommended by Cavanagh. Despite the controversy that surrounds eccentric exercise, it is important to note that these types of actions play an integral role in normal daily activities. Eccentric actions are used during most forms of movement, for example, in walking when the foot touches the ground and the center of mass is decelerated and in lowering objects, such as placing a bag of groceries in the car. EXERCISE DETRAINING: APPLICABILITY TO MICROGRAVITY

Edward F. Coyle *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 111-118 (For primary document see N94-28361 07-52)
Avail: CASI HC A02/MF A03

Physical training exposes the various systems of the body to potent physiologic stimuli. These stimuli induce specific adaptations that enhance an individual's tolerance for the type of exercise encountered in training. The level of adaptation and the magnitude of improvement in exercise tolerance is proportional to the potency of the physical training stimuli. Likewise, our bodies are stimulated by gravity, which promotes adaptations of both the cardiovascular and skeletal muscles. Exposure to microgravity removes normal stimuli to these systems, and the body adapts to these reduced demands. In many respects the cessation of physical training in athletes and the transition from normal gravity to microgravity represent similar paradigms. Inherent to these situations is the concept of the reversibility of the adaptations induced by training or by exposure to normal gravity. The reversibility concept holds that when physical training is stopped (i.e., detraining) or reduced, or a person goes from normal gravity to microgravity, the bodily systems readjust in accordance with the diminished physiologic stimuli. The focus of this chapter is on the time course of loss of the adaptations to endurance training as well as on the possibility that certain adaptations persist, to some extent, when training is stopped. Because endurance exercise training generally improves cardiovascular function and promotes metabolic adaptations within the exercising skeletal musculature, the reversibility of these specific adaptations is considered. These observations have some applicability to the transition from normal to microgravity. Author (revised)

AEROBIC FITNESS AND ORTHOSTATIC TOLERANCE: EVIDENCE AGAINST AN ASSOCIATION

Thomas J. Ebert *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 121-128 (For primary document see N94-28361 07-52)
Avail: CASI HC A02/MF A03

This presentation will focus on only one side of the debate as to whether high levels of aerobic fitness have a deleterious effect on tolerance to gravitational stress. This issue was raised in the early 1970's as a result of two research publications. The first work investigated the carotid sinus baroreflex of humans with an airtight chamber that surrounded the head and neck. The steady-state reflex changes in blood pressure that were recorded 3 minutes after application of the head and neck stimuli, were attenuated in an athletic group compared to a sedentary group of volunteers. A second report in the NASA literature indicated that five endurance-trained runners were less tolerant to LBNP than five nonrunners.

These early research findings have stimulated a considerable amount of interest that has lead to a growing number of research efforts seeking an association between aerobic fitness and orthostatic tolerance in humans. I will briefly review some of the more pertinent published research information which suggests that there is no relationship between aerobic fitness and orthostatic tolerance in humans. Author (revised)

DOES TRAINING-INDUCED ORTHOSTATIC HYPOTENSION RESULT FROM REDUCED CAROTID BAROREFLEX RESPONSIVENESS?

James A. Pawelczyk and Peter B. Raven *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 129-140 (For primary document see N94-28361 07-52)

Avail: CASI HC A03/MF A03

As manned space travel has steadily increased in duration and sophistication, the answer to a simple, relevant question remains elusive. Does endurance exercise training - high intensity rhythmic activity, performed regularly for extended periods of time - alter the disposition to, or severity of, postflight orthostatic hypotension? Research results continue to provide different views; however, data are difficult to compare because of the following factors that vary between investigations: the type of orthostatic stress imposed (+Gz, lower body negative pressure (LBNP), head-up tilt); pretest perturbations used (exercise, heat exposure, head-down tilting, bed rest, water immersion, hypohydration, pharmacologically-induced diuresis); the length of the training program used in longitudinal investigations (days versus weeks versus months); the criteria used to define fitness; and the criteria used to define orthostatic tolerance. Generally, research results indicate that individuals engaged in aerobic exercise activities for a period of years have been reported to have reduced orthostatic tolerance compared to untrained control subjects, while the results of shorter term longitudinal studies remain equivocal. Such conclusions suggest that chronic athletic training programs reduce orthostatic tolerance, whereas relatively brief (days to weeks) training programs do not affect orthostatic tolerance to any significant degree (increase or decrease). A primary objective was established to identify the alterations in blood pressure control that contribute to training-induced orthostatic hypotension (TIOH). Although any aspect of blood pressure regulation is suspect, current research has been focused on the baroreceptor system. Reductions in carotid baroreflex responsiveness have been documented in exercise-trained rabbits, reportedly due to an inhibitory influence from cardiac afferent, presumably vagal, nerve fibers that is abolished with intrapericardiac denervation. The purpose of this investigation was to attempt to determine if similar relationships existed in men with varied levels of fitness, using maximal aerobic power, VO2 max, as the marker of fitness. CARDIAC OUTPUT AND CARDIAC CONTRACTILITY BY IMPEDANCE CARDIOGRAPHY DURING EXERCISE OF RUNNERS

W. G. Kubicek and R. A. Tracy *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 141-149 (For primary document see N94-28361 07-52)

Avail: CASI HC A02/MF A03

Most of the solid state electronic engineering of the system now generally known as the Minnesota Impedance Cardiograph was performed with the support of a five-year contract, NAS9-4500, with the NASA Lyndon B. Johnson Space Center, Houston, Texas. This contract ran from 1965 to 1970. In addition to the engineering design and development of the hardware, the contract called for testing on both animals and human subjects. This project also provided funds to construct twenty impedance cardiographs and place them in selected research and clinical facilities for further evaluation. This, then, led to the First Symposium on Impedance Cardiography, held at the NASA Lyndon B. Johnson Space Center, Houston, Texas, 2-4 June 1969. Twenty-four excellent papers were presented. WEIGHTLESSNESS AND THE HUMAN SKELETON: A NEW PERSPECTIVE

Michael F. Holick *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 153-168 (For primary document see N94-28361 07-52)

Avail: CASI HC A03/MF A03

It is now clear after more than two decades of space exploration that one of the major short- and long-term effects of microgravity on the human body is the loss of bone. The purpose of this presentation will be to review the data regarding the impact of microgravity and bed rest on calcium and bone metabolism. The author takes the position in this Socratic debate that the effect of microgravity on bone metabolism can be either reversed or mitigated. As we begins to contemplate long-duration space flight and habitation of Space Station Freedom and the moon, one of the issues that needs to be addressed is whether humans need to maintain a skeleton that has been adapted for the one-g force on earth. Clearly, in the foreseeable future, a healthy and structurally sound skeleton will be required for astronauts to shuttle back and forth from earth to the moon, space station, and Mars. Based on most available data from bed-rest studies and the short- and long-duration microgravity experiences by astronauts and cosmonauts, bone loss is a fact of life in this environment. With the rapid advances in understanding of bone physiology it is now possible to contemplate measures that can prevent or mitigate microgravity-induced bone loss. Will the new therapeutic approaches for enhancing bone mineralization be useful for preventing significant bone loss during long-term space flight? Are there other approaches such as exercise and electrical stimulation that can be used to mitigate the impact of microgravity on the skeleton? A recent study that evaluated the effect of microgravity on bone modeling in developing chick embryos may perhaps provide a new perspective about the impact of microgravity on bone metabolism. IRREVERSIBILITY OF ADVANCED OSTEOPOROSIS: LIMITED ROLE FOR PHARMACOLOGIC INTERVENTION

A. M. Parfitt *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 169-174 (For primary document see N94-28361 07-52)

Avail: CASI HC A02/MF A03

Osteoporosis is of medical interest only because it increases bone fragility and risk of fracture, and except for relief of symptoms, preventing fracture is the only purpose of intervention. To prevent the first fracture, adequate bone density must be accumulated and conserved, but to prevent subsequent fracture, bone density must be augmented so that the supportive function of the skeleton can be restored. Almost 50 years after the recognition of post menopausal osteoporosis as a clinical entity, not one of the many treatments that have been used has been demonstrated to be efficacious in reducing subsequent fracture risk. My purpose is not to recite this chronicle of disappointment, but to account for it in terms of bone biology, to consider some possible exceptions, and to reiterate the importance of preventing damage to the skeleton rather than belatedly attempting its repair. EXERCISE AND OSTEOPOROSIS: METHODOLOGICAL AND PRACTICAL CONSIDERATIONS

Jon E. Block, Anne L. Friedlander, Peter Steiger, and Harry K. Genant *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 175-180 (For primary document see N94-28361 07-52)

Avail: CASI HC A02/MF A03

Physical activity may have important implications for enhancing bone density prior to the initiation of space flight, for preserving bone density during zero gravity, and for rehabilitating the skeleton upon return to Earth. Nevertheless, the beneficial effects of exercise upon the skeleton have not been proven by controlled trials and no consensus exists regarding the type, duration, and intensity of exercise necessary to make significant alterations to the skeleton. The following sections review our current understanding of exercise and osteoporosis, examine some of the methodological shortcomings of these investigations, and make research recommendations for future clinical trials. ELECTRICAL STIMULATION IN EXERCISE TRAINING

Walter Kroll *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 183-186 (For primary document see N94-28361 07-52)
Avail: CASI HC A02/MF A03

Electrical stimulation has a long history of use in medicine dating back to 46 A.D. when the Roman physician Largus found the electrical discharge of torpedo fishes useful in the treatment of pain produced by headache and gout. A rival Greek physician, Dioscorides, discounted the value of the torpedo fish for headache relief but did recommend its use in the treatment of hemorrhoids. In 1745, the Leyden jar and various sized electrostatic generators were used to treat angina pectoris, epilepsy, hemiplegia, kidney stones, and sciatica. Benjamin Franklin used an electrical device to treat successfully a young woman suffering from convulsive fits. In the late 1800's battery powered hydroelectric baths were used to treat chronic inflammation of the uterus while electrified athletic supporters were advertised for the treatment of male problems. Fortunately, such an amusing early history of the simple beginnings of electrical stimulation did not prevent eventual development of a variety of useful therapeutic and rehabilitative applications of electrical stimulation. Over the centuries electrical stimulation has survived as a modality in the treatment of various medical disorders with its primary application being in the rehabilitation area. Recently, a surge of new interest in electrical stimulation has been kindled by the work of a Russian sport scientist who reported remarkable muscle strength and endurance improvements in elite athletes. Yakov Kots reported his research on electric stimulation and strength improvements in 1977 at a Canadian-Soviet Exchange Symposium held at Concordia University in Montreal. Since then an explosion of new studies has been seen in both sport science and in medicine. Based upon the reported works of Kots and the present surge of new investigations, one could be misled as to the origin of electrical stimulation as a technique to increase muscle strength. As a matter of fact, electric stimulation has been used as a technique to improve muscle strength for over a century. Bigelow reported in 1894, for example, the use of electrical stimulation on a young man for the purpose of increasing muscle strength. Employing a rapidly alternating sinusoidal induced current and a dynamometer for strength testing, Bigelow reported that the total lifting capacity of a patient increased from 4328 pounds to 4639 pounds after only 25 minutes of stimulation. In 1965, Massey et al. reported on the use of an Isotron electrical stimulator that emitted a high frequency current. Interestingly enough, the frequencies used by Massey et al. and the frequencies used by Bigelow in 1894 were in the same range of frequencies reported by Kots as being the most effective in strength development. It would seem the Russian secret of high frequency electrical stimulation for strength development, then, is not a modern development at all. Author

THE VALUE OF ELECTRICAL STIMULATION AS AN EXERCISE TRAINING MODALITY
Dean P. Currier, J. Michael Ray, John Nyland, and Tim Noteboom *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 187-191 (For primary document see N94-28361 07-52)
Avail: CASI HC A01/MF A03

Voluntary exercise is the traditional way of improving performance of the human body in both the healthy and unhealthy states. Physiological responses to voluntary exercise are well documented. It benefits the functions of bone, joints, connective tissue, and muscle. In recent years, research has shown that neuromuscular electrical stimulation (NMES) simulates voluntary exercise in many ways. Generically, NMES can perform three major functions: suppression of pain, improve healing of soft tissues, and produce muscle contractions. Low frequency NMES may gate or disrupt the sensory input to the central nervous system which results in masking or control of pain. At the same time NMES may contribute to the activation of endorphins, serotonin, vasoactive intestinal polypeptides, and ACTH which control pain and may even cause improved athletic performances. Soft tissue conditions such as wounds and inflammations have responded very favorably to NMES. NMES of various amplitudes can induce muscle contractions ranging from weak to intense levels. NMES seems to have made its greatest gains in rehabilitation where directed muscle contractions may improve joint ranges of motion correct joint contractures that result from shortening muscles; control abnormal movements through facilitating recruitment or excitation into the alpha motoneuron in orthopedically, neurologically, or healthy subjects with intense sensory, kinesthetic, and proprioceptive information; provide a conservative approach to management of spasticity in neurological patients; by stimulation of the antagonist muscle to a spastic muscle stimulation of the agonist muscle, and sensory habituation; serve as an orthotic substitute to conventional bracing used with stroke patients in lieu of dorsiflexor muscles in preventing step page gait and for shoulder muscles to maintain glenohumeral alignment to prevent subluxation; and of course NMES is used in maintaining or improving the performance or torque producing capability of muscle. NMES in exercise training is our major concern. Author (revised)

THE USE OF BIOMECHANICS IN THE STUDY OF MOVEMENT IN MICROGRAVITY
R. J. Gregor, J. P. Broker, and M. M. Ryan *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 195-201 (For primary document see N94-28361 07-52)
Avail: CASI HC A02/MF A03

As biomechanists interested in the adaptability of the human body to microgravity conditions, it appears that our job is not only to make sure that the astronauts can function adequately in space but also that they can function upon their return to Earth. This is especially significant since many of the projects now being designed at NASA concern themselves with humans performing for up to 3 years in microgravity. While the Extended Duration Orbiter flights may last 30 to 60 days, future flights to Mars using current propulsion technology may last from 2 to 3 years. It is for this range of time that the adaptation process must be studied. Specifically, biomechanists interested in space travel realize that human performance capabilities will change as a result of exposure to microgravity. The role of the biomechanist then is to first understand the nature of the changes realized by the body. These changes include adaptation by the musculoskeletal system, the nervous system, cardiorespiratory system, and the cardiovascular system. As biomechanists, it is also our role to take part in the development of countermeasure programs that involve some form of regular exercise. Exercise countermeasure programs should include a variety of modalities with full knowledge of the loads imposed on the body by these modalities. Any exercise programs that are to be conducted by the astronauts during space travel must consider the fact that the musculoskeletal and neuromuscular systems degrade as a function of flight duration. Additionally, it must be understood that the central nervous system modifies its output in the control of the human body during space flight and most importantly, we must prepare the astronauts for their return to one g. PSYCHOPHYSIOLOGY IN MICROGRAVITY AND THE ROLE OF EXERCISE
J. M. Shaw and A. C. Hackney *In* NASA. Johnson Space Center, Workshop on Countering Space Adaptation with Exercise: Current Issues Feb. 1994 p 205-213 (For primary document see N94-28361 07-52)
Avail: CASI HC A02/MF A03

The Space Transportation-Shuttle (STS) Program has greatly expanded our capabilities in space by allowing for missions to be flown more frequently, less expensively, and to encompass a greater range of goals than ever before. However, the scope of the United State's role and involvement in space is currently at the edge of a new and exciting era. The National Aeronautics and Space Administration (NASA) has plans for placing an orbiting space station (Space Station Freedom) into operation before the year 2000. Space Station Freedom promises to redefine the extent of our involvement in space even further than the STS program. Space Station crewmembers will be expected to spend extended periods of time (approximately 30 to 180 days) in space exposed to an extremely diverse and adverse environment (e.g., the major adversity being the chronic microgravity condition). Consequently, the detrimental effects of exposure to the microgravity environment is of primary importance to the biomedical community responsible for the health and well-being of the crewmembers. Space flight and microgravity exposure present a unique set of stressors for the crewmember; weightlessness, danger, isolation/confinement, irregular work-rest cycles, separation from family/friends, and mission/ground crew interrelationships. A great deal is beginning to be known about the physiological changes associated with microgravity exposure, however, limited objective psychological findings exist. Examination of this latter area will become of critical concern as NASA prepares to place crewmembers on the longer space missions that will be required on Space Station Freedom. Psychological factors, such as interpersonal relations will become increasingly important issues, especially as crews become more heterogeneous in the way of experience, professional background, and assigned duties. In an attempt to minimize the detrimental physiological effects of prolonged space flight and microgravity exposure, the United States and Russian space agencies have taken steps to implement various countermeasure programs. One of the principle countermeasures used by both nations is exercise during space flight. The purpose is to present a brief overview of the major research findings examining the psychophysiological changes associated with microgravity exposure, and to address the potential role of exercise as a countermeasure in affecting these psychophysiological changes. A visit to CERMA is reported. The purpose of the journey was to visit the division for space and aviation ergonomics at CERMA to discuss cooperation between FOA and CERMA within the agreements now being established between FOA and DRET concerning co-operation within defense research. DRET is the organization for defense research in France and is the equivalent to FOA in Sweden. There are four research themes: (1) effects of variations in gravitation (acceleration, space) on the cardiovascular and musculoskeletal systems; (2) man-machine interfaces (MMI) in complex systems; (3) perturbations in vigilance; and (4) nutrition. At the division for space and aviation ergonomics, research is carried out on the following themes: (1) vision, (2) man-machine dialog, and (3) applied neurophysiology. The main result of the journey was a proposal to co-operate in visual information retrieval, color perception, and colorcoding. NTIS

DEVELOPING REALISTIC COOPERATIVE BEHAVIORS FOR AUTONOMOUS AGENTS IN AIR COMBAT SIMULATION M.S. Thesis
Dean P. Hipwell Dec. 1993 169 p
(AD-A274077; AFIT/GCE/Eng/93D-05) Avail: CASI HC A08/MF A02

This thesis investigated, developed, and implemented cooperative decision-making behaviors in an air combat simulation by using a knowledge-based system. Knowledge-based systems were well suited for this task because of built-in features such as inference engines and rule-based constructs. This thesis addresses the specific problem of generating autonomous forces for inclusion in the Advanced Research Projects Agency Distributed Interactive Simulation program. Existing autonomous forces implementations lacked flexibility, realistic behaviors, real-time planning, and other features. The simulation system in this thesis addresses the problem of realistic behavior by modeling pilot decision processes rather than aircraft platforms. The system is based on phased control of a blackboard architecture. Modular knowledge bases partition rules to process decision data. Cooperative behaviors are based on a leader-follower relationship. Agents share the workload in assessing threats. Leaders make the initial decision, but followers react independently if necessary. The simulator described in this thesis provides an architecture and design for modeling combat pilot decision processes. The system was developed using the C Language Integrated Production System Object Oriented Language. DTIC

A TEST OF THE THEORY OF REASONED ACTION AT THE GROUP LEVEL OF ANALYSIS M.S. Thesis
Thomas A. Fitch and Edward A. McCarty Sep. 1993 52 p
(AD-A273965; AFIT/GLM/LAR/93S-16) Avail: CASI HC A04/MF A01

A vast array of studies exist which have sought to explore the relationships between behavioral intentions, job satisfaction, turnover and performance at the individual level of analysis. Recent efforts to move to the group level of analysis have shown some promise, but few exist. The crux of the issue under consideration here was whether or not there was utility in treating attitude-intention-behavior linkages as group level phenomena. Both Schneider (1987) and George (1990' contend that, while individual analysis cannot be discounted as a means of understanding behavior, there is also value in examining group-level phenomena. The purpose of this study was to test the generalizability of Fishbein and Ajzen's (1975) model to the group level of analysis by assessing the pattern of relationships among attitudinal, intentional, and behavioral variables. The objective of the project was to determine whether or not the basic assumptions of the theory held at the group level of analysis. DTIC

PACING VISUAL ATTENTION: TEMPORAL STRUCTURE EFFECTS Ph.D. Thesis
June J. Skelly Jun. 1993 194 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AF Proj. 7184)
(AD-A273859; AL-TR-1993-0024) Avail: CASI HC A09

The role of temporal relationships in how we attend to dynamic visual events was investigated. Specifically, those factors that are temporal in nature, i.e., the rate and rhythm of event sequences, were the primary variables of interest. The research explored the possibility that persisting temporal relationships may be an important factor in the external (exogenous) control of visual attention, at least to some extent, was the focus of the current research. Five experiments attempted to identify the respective roles of rate and rhythm time parameters in a simple selective attention task involving two differently timed streams of information. Results from these experiments indicated that the rhythmic structure of integrated streams was a more powerful 'pacing' factor than either of the rhythm or rate of single stream. Together, these experiments suggest that there may be two kinds of temporal 'pacing' in visual attention: (1) a passive entrainment with external time patterns, and (2) the active 'use' of timing relationships to shift and direct the focus of attention. A COMPARISON OF TWO HARDWARE IMPLEMENTATIONS OF A CREW SELECTION SYSTEM Special Report
T. Nontasak and K. T. Helton Oct. 1993 16 p
(AD-A274913; NAMRL-SR-93-3) Avail: CASI HC A03/MF A01

A number of disadvantages existed within the Apple IIe version of the Landing Craft Air Cushion vehicle Crew Selection System (LCSS). These disadvantages included slow processing speed, memory constraints, and cumbersome test administration. The system was also less conducive to future test development. The LCSS was upgraded to an IBM PC compatible Zenith 248 system. A comparison of 48 single and composite subtest scores between like measures of the two systems yielded significant positive correlations (p less than .0001). The majority of the correlations ranged from .60 to .89. A small percentage of the associations were less robust. Overall, however, the Apple IIe and Zenith 248 versions of the LCSS proved to be comparable testing systems. DTIC

PERFORMANCE ASSESSMENT IN SUSTAINED OPERATIONS USING A COMPUTER-BASED SYNTHETIC WORK TASK
Timothy F. Elsmore, Paul Naitoh, and Steven Linnville 1993 32 p
(DA Proj. M00-96; DA Proj. MM3-P-30)
(AD-A274707; NHRC-92-30) Avail: CASI HC A03/MF A01

Prediction of the effects of stressors on military performance from laboratory tests frequently involves use of procedures simulating critical functional aspects of military jobs. This paper presents a computerized 'Synthetic Work' test, SYNWORKI, as a prototypical alternative to traditional Performance Assessment Batteries. This test simulates complex operational environments by requiring subjects to work on four simultaneous tasks, and assigns explicit consequences for work on each component task. As illustrations of the utility of this technique, data are presented from three applications of SYNWORK1, a laboratory study of sleep deprivation, a test of extended exposure to a simulated sonar 'ping', and the use of the same task during army operations in Operation Desert Storm. VALIDATION OF THE FEDERAL AVIATION ADMINISTRATION AIR TRAFFIC CONTROL SPECIALIST PRE-TRAINING SCREEN Final Report

Dana Broach and Jan Brecht-Clark (Federal Aviation Administration, Washington, DC.) Feb. 1994 15 p

(DOT/FAA/AM-94/4) Avail: CASI HC A03/MF A01

Two formal validation studies of the Air Traffic Control Specialist Pre-Training Screen (ATCS/PTS), a 5-day computer-administered test battery, are described. The ATCS/PTS was designed to replace the 9-week U.S. Federal Aviation Administration (FAA) Academy ATCS Nonradar Screen program that served as the second major test in the ATCS selection system. Review of ATCS job analyses suggested that predictor tests should assess cognitive constructs such as spatial reasoning and short-term memory, and require dynamic, concurrent performance. A proposed test battery was developed, consisting of 2 computer-administered information processing tests and a simplified radar-based air traffic control work sample. In study 1, predictive, criterion-related validation (N = 438) found that the proposed test battery explained additional variability in scores earned in the 9-week FAA Academy program, after taking into account student aptitude. In study 2, criterion-related validation (N = 297) demonstrated that the proposed test battery was as valid as the 9-week FAA Academy ATCS Nonradar Screen for predicting progress in field training. Preliminary data from a third study conducted after validation of the ATCS/PTS seem to suggest that the abilities assessed by the new computerized tests reflect the abilities required on the job. However, implementation of the ATCS/PTS for actual employment decision-making in June 1992 was based on results obtained in the second concurrent, criterion-related validation study. The U.S. controller selection system since June 1992 consisted of the 4-hour written ATCS aptitude test battery followed by, for those applicants earning a qualifying score and dependent upon agency manpower requirements, second-level screening on the ATCS/PTS. Additional research requirements as part of an aviation program are described. Author (revised)

THE CENTRAL EXECUTIVE COMPONENT OF WORKING MEMORY Final Report, 1 Sep. 1990 - 31 Aug. 1993

A. Baddeley, J. Duncan, and H. Emslie 31 Oct. 1993 47 p

(Grant AF-AFOSR-0343-90)

(AD-A274295; AFOSR-93-0896TR) Avail: CASI HC A03/MF A01

A distinction between voluntary/controlled and stimulus-driven/automatic behavior has been separately applied to the effects of frontal lobe lesions, individual differences in general intelligence or Spearman's g, and interference between dissimilar, concurrent tasks. We suggest that these three problems are indeed closely linked, all concerning a process of selection between alternative goals or abstract requirements on behavior, especially under conditions of novelty and /or weak environmental cues to action. Among our findings are: (1) Executive deficits following frontal lesions are specifically associated with losses in fluid intelligence; (2) Conventional frontal tests have little in common besides g. (3) Across a wide range of spatial and verbal tasks, dual task interference is closely related to both g correlations and frontal lobe involvement. This may only be true, however, when the secondary task is random sequence generation, designed to avoid stereotype. (4) Frontal patients and people from the lower part of the g distribution share a tendency to goal neglect, or disregard of a task requirement even though that requirement has been understood. Neglect is confined to novel behavior, eliminated by verbal prompts, and sensitive to the number of concurrent goals. (5) In speeded stimulus classification, switching classification rules produces high g correlations. Correlations rapidly decrease, however, with practice on a fixed rule. The results begin to clarify the role of executive control in the organization of behavior. DTIC

FEMALE COMBAT HELICOPTER PILOT SELECTION CRITERIA M.S. Thesis

Wendy R. Mullins 4 Jun. 1993 112 p

(AD-A273935) Avail: CASI HC A06/MF A02

This study investigates selection criteria for selecting female aviators for training in combat helicopters (AH-64, AH-1, OH-58D, and RAH-66). Selection for such training would occur as either a part of the multitrack program of instruction used in the current Initial Entry Rotary Wing flight training course, or as transition training for already qualified aviators. Analysis included a review of: current Army regulations governing prerequisites for combat helicopter training and combat helicopter maintenance test pilot training; Initial Entry Rotary Wing selection criteria for combat helicopter tracks (AH-1 and OH-58); Aviation Branch personnel manager interviews; combat helicopter manprint/anthropometric restrictions; standards of medical fitness; anthropometric standards; and previous reports on female performance in Initial Entry Rotary Wing training. Conclusion supports selecting females for combat helicopter training using the same selection criteria currently used for choosing males for such training. Study recommends additional research in aircraft accommodation measurements, social-psychological aspects, and physical body strength requirements. DTIC

INTERACTING CORTICAL FILTERS FOR OBJECT RECOGNITION

N. Petkov and T. Lourens 1994 19 p See also PB94-125366 Sponsored by Nederlandse Organisatie voor Wetenschappelijk Onderzoek, The Hague Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-125374; CS-9303) Avail: Issuing Activity (National Technical Information Service (NTIS))

It is shown how cortical filters can be used for image analysis and object recognition. Similarly to previous work in this area, we compute functional inner products of a two-dimensional input signal (image) with a set of two-dimensional Gabor functions which fit the receptive fields of simple cells in the primary visual cortex of mammals. We propose a method in which these inner products become the subject of thresholding, orientation competition and lateral inhibition. Each of the resulting cortical images contains only edge lines of a particular orientation and a particular light-to-dark transition direction. In this way, the information which is present in the original image is split in different channels and we show how this splitting can be used for object recognition. Each cortical image is reduced to a single number so that a set of cortical images that emanate from the same input image is reduced to a set of descriptors of the input image which are robust for translations of an object in the visual field. Multi-scale resolution and dynamic programming are used to compensate for size variations, rotations and non-topologic form differences. The method discriminates between simple geometrical figures, e.g. polygons with different numbers of edges, with reliability of 100% and a recognition rate of 99% has been achieved when the method was applied to a large database of face images. BENEFITS ESTIMATION FOR SIMULATION SYSTEMS USED FOR AIRCREW TRAINING IN A MULTISHIP ENVIRONMENT Final Report, Jul. - Oct. 1992

William C. Moor and Dee H. Andrews Nov. 1993 44 p

(AD-A274313; AL/HR-TR-1993-0158) Avail: CASI HC A03/MF A01

A general model for the benefit evaluation of multiship training simulation systems is presented. The benefit measures derived are oriented toward allowing benefit-cost evaluations of proposed alternative simulation systems. The model is based on empirical data drawn from evaluation studies of simulators as well as analytical approaches. The focus of the approach using this model is selecting the most appropriate and economic simulators for use at the operational level. The model does not attempt to compare, or justify the comparison of, the training value of a specific simulator versus a specific aircraft. The model allows for full sensitivity analysis and variation of all important parameters. A set of LOTUS 1-2-3 spreadsheets are presented which facilitate the use of the model. The model is demonstrated by means of an application which is based on actual data. DTIC

ORIENTATION COMPETITION IN CORTICAL FILTERS
N. Petkov, T. Lourens, and P. Kruizinga 1994 15 p See also PB94-125374
(PB94-125366; CS-9302) Avail: CASI HC A03/MF A01

This work presents explorations in the microstructure of natural vision systems based on large scale computer simulations. Similarly to previous work in this area, we compute the functional inner products of a two-dimensional input signal (image) with a set of two-dimensional Gabor functions which have been shown to fit the receptive fields of simple cells in the primary visual cortex of mammals. These inner products are then considered as net inputs to the cortical cells and used to compute the cell activations as non-linear functions. A previously used model is extended with a pixel-wise winner-takes-all competition between different Gabor filters which is introduced in order to increase the orientation sensitivity of computed cortical cell responses. The effect of this competition is qualitatively estimated by visualization of computed cortical images and quantitatively evaluated by applying the model to a face recognition problem. Recognition rate of 97% was achieved on a database of 205 face images of 30 persons vs 94% achieved with a previously used model. NTIS

INDUCED PICTORIAL REPRESENTATIONS Final Technical Report, 1 Nov. 1988 - 30 Nov. 1993
Barbara G. Tversky 30 Nov. 1993 31 p
(Grant AF-AFOSR-0076-89)
(AD-A274251; AFOSR-93-0887TR) Avail: CASI HC A03/MF A01

Language is often used to describe environments or to give directions. This project investigated how spatial language describing large and small scale environments is comprehended and produced. The research on large scale environments, such as a town, has shown that in descriptions, people adopt either a route or a survey perspective or a mixture of both. In comprehension of such descriptions, people form spatial mental models that are more abstract than either perspective. The research on small scale environments investigated people's mental models of the objects surrounding them. People are faster to access objects at some directions from their bodies than others. Accessibility depends on enduring characteristics of the perceptual world and the relation of the body to it. Several variations and extensions of each project are described. The research has implications for spatial cognition as well as language comprehension and production. DTIC

HUMAN DIMENSIONS RESEARCH TEAM, OPERATION RESTORE HOPE Report, 26 Jan. - 5 Mar. 1993
Robert K. Gifford, James N. Jackson, and Kathleen B. DeShazo 5 Mar. 1993 14 p
(AD-A274340) Avail: CASI HC A03/MF A01

The purpose of this investigation was to assess soldier coping and adaptation to the stresses of operation Restore Hope. Interviews, observations, and command consultation generated the data necessary to delineate key themes. Perhaps the most important of the investigation's findings was that current Army doctrine and practices provided the support necessary for the deployed force to successfully adapt to the unique challenges of operation Restore Hope. The Human Dimensions Research Team detected no problems that were severe enough to threaten/comprise the Army's ability to perform its mission, or that would portend significant future mental health problems (e.g., post-traumatic stress disorder). While there were numerous, identifiable stressors (e.g., redeployment uncertainty, mission ambiguity, restrictive rules of engagement, slow mail, limited phone access), none were unexcepted, and more importantly, none were beyond the soldiers' or units' capacity to cope. TOP DOWN INFLUENCES ON BOTTOM-UP PROCESSING Final Report, Sep. 1989 - Sep. 1993
Whitman Richards 27 Oct. 1993 34 p
(Grant AF-AFOSR-0504-89)
(AD-A274220; AFOSR-93-0893TR) Avail: CASI HC A03/MF A01

Although integrated computational and psychophysical studies have considerably advanced our understanding of early visual processing (up to Marr's 2 1/2 D Sketch), much less research, by comparison, is being conducted on intermediate and higher-level vision. One reason for the scarcity is that high-level vision includes goal-directed, context-sensitive, top-down knowledge. However, little is known about these aspects of vision and how they are organized in the visual knowledge base (for example, how default preferences and categorical states are organized and related). Hence, plausible, detailed computational models can't be formulated. These studies begin to reveal the structure of some aspects of cognitive visual knowledge. DTIC

SIGNAL- AND LISTENER-BASED FACTORS IN COMPLEX AUDITORY PATTERN PERCEPTION Annual Technical Report, 15 Sep. 1992 - 15 Sep. 1993
Arthur G. Samuel 9 Nov. 1993 13 p
(Grant AF-AFOSR-0378-91)
(AD-A274148; AFOSR-93-0906TR) Avail: CASI HC A03/MF A01

The research conducted during the second year of AFOSR grant 91-0378 investigated fundamental issues in the early processing of speech and similarly complex acoustic signals. The research pursued the information processing goal of specifying the levels of analysis that occur between the initial sensory coding of the signal and the recognition of the phonetic sequence it conveys. Five experiments provided evidence for the existence of at least three qualitatively different levels of perceptual analysis. The data help to specify the properties of each level, including a locus (peripheral versus central), a stimulus domain, and the mechanisms affected by repeated stimulation. The convergence across several different approaches used to determine levels of analysis supports the three-level model. DTIC

ON THE DEVELOPMENT OF MOTOR CHUNKS AND CONCURRENT PROCESSING IN A STRUCTURED CONTINUOUS KEYPRESSING TASK Final Report
W. B. Verwey and Y. Dronkert Jun. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A274153; IZF-1993-B-6; TDCK-93-1348) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report describes an experiment designed to assess the effects of practice in performing a structured sequence of keypresses. The task consisted of pressing a sequence of nine keys with nine fingers, each in response to a corresponding stimulus. Each response was followed by a response-stimulus interval (RSI), which sometimes was zero ms, before the next stimulus was presented. Upon completion of one sequence, production of the identical sequence was immediately repeated. One group of 18 subjects - the 333 group - practiced with three regularly spaced, non-negligible RSI's while the remaining RSI's were zero. This divided the sequence into three groups of three keypresses each. Another group of 18 subjects - the 45 group - practiced with two non-negligible RSI's partitioning the sequence into a four- and a five-key group. These conditions were coined structured conditions. On occasion all subjects carried out a condition in which all RSI's were zero. This was the unstructured condition. The results show that interkey times in this condition clearly reflected the position of the long RSI's in the structured condition. This suggests that motor chunks had developed in the structured condition which were also used in the unstructured condition. More detailed analyses suggest that preparing one chunk concurred with execution of the preceding chunk in the unstructured and probably also in the structured condition. Concurrent preparation of the next chunk slowed down execution of the preceding chunk in the unstructured condition. In the structured condition it concealed effects of chunk-size on initiating each chunk (i.e. the complexity effect). DTIC

AN ALGORITHM FOR STEREO CORRESPONDENCE PROBLEMS ON THE ANALOGY OF HUMAN VISION [HITO NO SHIKAKU NI MANANDA BIDEO KAMERA NO SHISEN SEIGYO NIYORU TAIOTEN TANSAKU]

Hiromi Gomi Nov. 1992 32 p In JAPANESE
(ISSN 0389-4010)
(NAL-TR-1185; JTN-94-80614) Avail: CASI HC A03/MF A01

An approach for solving stereo correspondence problems that imitates human vision is proposed and verified by directing two cameras to the same point in experiments. The algorithm is based on the fact that the illuminance difference between images on left and right human retinal foveae is minimized when both eyes look at the same point. This is due to the fact that the difference between the images is smaller than the resolution. The algorithm is robust against camera discrepancies and has an operating range similar to that of human vision. The algorithm is an area-based method using 256 x 256 picture elements, which is greater than ordinary template matchings, and is not affected by the relative illuminance of the lens because of convergence control of the cameras. CREATION OF PROTOTYPE AIRCREW PROTECTION EQUIPMENT BASED ON FACE ANTHROPOMETRY M.S. Thesis

Martin E. Piccus, Gary A. Smith, Brian K. Standley, Tami L. Volk, and Linda B. Wildes Dec. 1993 325 p
(AD-A273865; AFIT/GSE/ENY/93D-2) Avail: CASI HC A14/MF A03

The objective of this research is to develop a process which will analyze and group human faces, concentrating on the oxygen mask seal area, into a minimum number of generic yet distinct face types. The shape and size, or form, of the face is described by bending energies. This bending energy provides the features for the grouping of similar face types, while distinguishing representatives for each cluster. The face tariffs are the percentage of faces grouped under a representative face. The representative faces are then transformed into three-dimensional solids using computer-aided design. A rapid prototype creates the solids or plugs from which MBU5/P masks are made and tested. The two major outcomes of this research are a formal morphological method which allows the comparison between multiple faces, and a process to transform anthropomorphic surfaces into a prototype mask mold. THE EFFECT OF PLATFORM MOTION ON HUMAN ENERGY EXPENDITURE DURING WALKING. AN EXPLORATORY EXPERIMENT Final Report

A. H. Wertheim, R. Heus, T. G. Vrijkotte, and J. T. Marcus 11 Aug. 1993 20 p
(AD-A273760; IZF-1993-B-10; TDCK-TD-93-1366) Avail: CASI HC A03/MF A01

An experiment was performed in which various physiological measures of energy expenditure were taken with subjects walking for periods of 10 minutes (either freely or on a treadmill) on a moving platform (Ship Motion Simulator). Platform motion was either in a heave, pitch or roll mode, or it was stationary. The results show that during pitch and roll movements of the platform energy expenditure is larger than during heave motions and when the platform remained stationary. Pitch and roll did not differ from each other, and neither did heave and stationary conditions. The results are interpreted as indicating that the muscular effort needed for the maintenance of balance when walking on a pitching or rolling platform requires a significant increase in energy expenditure. DTIC

HUMAN FACTORS IN AIRWAY FACILITIES MAINTENANCE: DEVELOPMENT OF A PROTOTYPE OUTAGE ASSESSMENT INVENTORY Final Report

Robert E. Blanchard and Jennifer J. Vardaman Feb. 1994 25 p
Prepared for FAA, Atlantic City, NJ
(DOT/FAA/AM-94/5) Avail: CASI HC A03/MF A01

The airway facilities (AF) maintenance community is concerned with identifying ways of reducing both the incidence of equipment failure and the amount of time required to restore equipment to operational status following a failure. It is vitally important to identify the many components of downtime and contributors to a particular outage (equipment failure). Thus, the primary objective was to develop a technique or tool with which to identify and map within a 'systems' structure all potentially-significant contributors to AF maintenance downtime. The technique was designed to facilitate (1) the collection of maintenance-related data during an actual outage; (2) the entry of this data into a data base; and (3) the analysis of the data base in order to identify causal relationships. The secondary objective was to be able to make use of past outage data as a means for building the data base by determining whether overall outage time values can be apportioned among the contributors to downtime using subject matter experts (SME's) who were intimately involved in restoring a given outage. SME's from the Oklahoma City (OKC) General National Airspace System (GNAS) Airway Facilities Sector (AFS) and the Memphis GNAS AFS assisted in the iterative design and review process that produced the Airway Facilities Outage Assessment Inventory - Form A (AFOAI). Ten previous OKC GNAS outages and four previous Memphis GNAS outages were analyzed using the AFOAI - Form A, thus confirming that the inventory is a useful tool in identifying specific contributors to AF maintenance downtime. Recommendations were to continue to refine the format of the AFOAI and to install it on a trial basis to test its usefulness in collecting and analyzing data on factors and conditions contributing to facility outages. A CRITICAL ANALYSIS OF WORKLOAD PREDICTIONS GENERATED BY MULTIPLE RESOURCE THEORY DURING EARLY CREWSTATION DESIGN Final Report

David Cohen, Robert J. Wherry, Jr., and Floyd Glenn 1 Jun. 1993 35 p
(AD-A274804; NAWCADWAR-TN-93043-60) Avail: CASI HC A03/MF A01

Subjective workload ratings based on multiple resource theory were independently collected from two highly experienced pilots for 225 different tasks of an anticipated mission for a future advanced strike aircraft. Factor analysis of their responses suggest that while such ratings could have little actual validity in and even high inter-rater reliabilities, the ratings have high face validity and even high inter-rater reliabilities, the ratings could have little actual validity in terms of efforts required to utilize the seven postulated resource channels (visual or auditory input, spatial, verbal, or analytical cognition, and manual or speech output). Ratings of efforts required for various postulated cognitive resource channels were particularly suspect. Four independent factors were identified for each pilot which accounted for virtually all of the intercorrelations among the seven resource channels. Three factors (visual-spatial, verbal communications, and manual and speech output) were identical for both pilots and accounted for most of their explainable variance. DTIC

EMERGING HUMAN-COMPUTER INTERFACE (HCI) DESIGN GUIDELINES FOR GRAPHICAL USER INTERFACE (GUI)

S. E. Bowser and S. M. Adams Oct. 1993 8 p Presented at the Human Factors and Ergonomics Society Meeting, Seattle, WA, 11-15 Oct. 1993
(Contract DE-AC06-76RL-01830)
(DE94-004293; PNL-SA-22009; CONF-9310100-7) Avail: CASI HC A02/MF A01

The requirement to establish baseline style references for Graphical User Interfaces (GUI's) is recognized. The ability to obtain consensus among user communities was limited to nonexistent. The authors are part of a team that developed a generic baseline human-computer interface (HCI) style guide for the U.S. Department of Defense (DoD). The DoD HCI Style Guide has its origin in a style guide developed by the intelligence community and in human factors design guidelines developed for Army tactical command and control systems. The DoD HCI Style Guide is intended to be a baseline style reference for the design of HCI's within DoD. The needs of specific user communities were addressed by including addenda that expand on the baseline and address focus areas of interest. The conclusion is that an overall or general style guide should be adopted for GUI's with allowance for specialized user group requirements and additions. The anticipated results would be higher productivity and reduced training and development time. DOE

SPACE STATION EVOLUTION STUDY OXYGEN LOOP CLOSURE Final Report

M. G. Wood and D. DeLong 17 Nov. 1993 40 p
(Contract NAS8-38783)
(NASA-CR-193938; NAS 1.26:193938) Avail: CASI HC A03/MF A01

In the current Space Station Freedom (SSF) Permanently Manned Configuration (PMC), physical scars for closing the oxygen loop by the addition of oxygen generation and carbon dioxide reduction hardware are not included. During station restructuring, the capability for oxygen loop closure was deferred to the B-modules. As such, the ability to close the oxygen loop in the U.S. Laboratory module (LAB A) and the Habitation A module (HAB A) is contingent on the presence of the B modules. To base oxygen loop closure of SSF on the funding of the B-modules may not be desirable. Therefore, this study was requested to evaluate the necessary hooks and scars in the A-modules to facilitate closure of the oxygen loop at or subsequent to PMC. The study defines the scars for oxygen loop closure with impacts to cost, weight and volume and assesses the effects of byproduct venting. In addition, the recommended scenarios for closure with regard to topology and packaging are presented. Author (revised)

A MULTIVARIATE ANTHROPOMETRIC METHOD FOR CREW STATION DESIGN: ABRIDGED Interim Report, Jan. 1989 - Dec. 1992

Gregory F. Zehner, Richard S. Meindl, and Jeffrey A. Hudson Apr. 1993 30 p
(Contract F33615-85-C-0541)
(AD-A274588; AL-TR-1992-0164) Avail: CASI HC A03/MF A01

Body size accommodation in USAF cockpits is still a significant problem despite all the years of experience and the many aircraft designs that have been developed. Adequate reach to controls, body clearances (particularly during escape) and vision (internal and external), are all functions of pilot body size and position in the cockpit. One of the roots of this problem is the way cockpit accommodation is specified and tested. For many years the percentile pilot has been used. This paper describes the errors inherent in the 'percentile man' approach, and presents a multivariate alternative for describing the body size variability existing in a given flying population. A number of body size representative cases are calculated which, when used properly in specifying, designing, and testing new aircraft, should ensure the desired level of accommodation. The approach can be adapted to provide anthropometric descriptions of body size variability for a great many designs or for computer models of the human body by altering the measurements of interest and/or selecting different data sets describing the anthropometry of a user population. This study was to confirm the military specification of toggle switch spacing for gloved operators. An examination of toggle switch operations with five different glove types was conducted: a butyl and cotton glove assembly, a butyl and nomex glove assembly, a leather and wool glove assembly, a fire-fighting glove, and a vinyl glove. Subjects were required to operate a sequence of four switches in a 3 by 3 array. Three switch spacings were investigated: 15 mm, 20 mm, and 25 mm. Half the subjects operated toggle switches located directly in front of them, and the other half operated switches located behind them, in a position where the switches could not be seen. Subjects were required to activate the toggle switches in specific sequences as quickly and as accurately as possible. The task was machine-paced, and the time allowed for operation of a sequence of switches became progressively shorter as the subject was able to continue correct operation. Each subject performed the task both gloved and bare-handed. DTIC

HELMET HEAD TRACKING MOUNTING DEVICE Patent Application
Christine Horvat, inventor (to Navy), Gary F. Bradley, inventor (to Navy), and Carroll L. Rhodes, inventor (to Navy) 23 Feb. 1993 14 p
(AD-D016048; US-Patent-Appl-SN-021388) Avail: CASI HC A03/MF A01

A unified, low-profile, lightweight, and strong component mounting system for an aircrew member's helmet is disclosed. The system includes a substantially rectangular mounting bracket that carries necessary power, communications, and optical inputs to the components, mounting hardware and specially designed interface pieces for each component. The system is designed to securely and easily snap-lock onto the helmet and is positioned to stay balanced while attached to eliminate crewmember discomfort. DTIC

TASK DEMAND, WORKLOAD, AND PERFORMANCE
B. Bergstroem Jul. 1993 31 p
(PB94-123627; FOA-A-50016-5.2) Avail: Issuing Activity (National Technical Information Service (NTIS))

The measurement of mental workload has become increasingly important as systems have become more complex and sophisticated. In this report workload and related concepts are discussed. Three dimensions of workload are recognized: task demand, operator workload (OWL), and performance. In order to measure OWL, the concepts capacity, resource, and effort must be defined and also related to a cognitive model of the brain. Four regions of workload operation are described: underload, resource dependent, maximum capacity, and overload. Satisfactory system function can only take place in the underload and resource dependent regions. It is finally concluded that to yield meaningful workload results the experimenter must control and measure task demand, OWL, and performance at the same time. NTIS

AN INVESTIGATION OF INTEGRATED PRODUCT DEVELOPMENT IMPLEMENTATION ISSUES: A CASE STUDY OF BOSMA MACHINE AND TOOL CORP. M.S. Thesis
F. P. Khuri and Howard M. Plevyak, Jr. Sep. 1993 108 p
(AD-A273917; AFIT/GSM/LAS/93S-11) Avail: CASI HC A06/MF A02

This thesis investigated integrated product development (IPD) implementation issues. Research emphasis focused on teams used in IPD, particularly self-directed work teams (SDWT's). The areas addressed in the study were: work environment, team organization, training and education, group dynamics and communication, motivation, rewards and incentives, measurements, and contracts. Data was collected using interviews and presented as a case study. The most significant findings on work environment were that the organization's leadership should commit to the teaming idea and sell it to the organization's members. Teams should be organized by choosing members carefully and defining all roles. Personnel should be trained in technical skills and human relations. Group interaction should be ensured by establishing open communication in a non-attribution setting. The greatest motivator of personnel is pride of ownership. A measurement baseline should be established at the outset against which productivity, efficiency, and morale may be measured. Finally, team members should be allowed to provide inputs to any contract which involves them. Author (revised)

SPACELAB LIFE SCIENCES 2 POST MISSION REPORT Final Report, 16 Jan. - 30 Nov. 1993
Jay C. Buckey 14 Jan. 1994 10 p
(Contract NAS9-18736)
(NASA-CR-195544; NAS 1.26:195544; Rept-1) Avail: CASI HC A02/MF A01

Jay C. Buckey, M.D., Assistant Professor of Medicine at The University of Texas Southwestern Medical Center at Dallas served as an alternate payload specialist astronaut for the Spacelab Life Sciences 2 Space Shuttle Mission from January 1992 through December 1993. This report summarizes his opinions on the mission and offers suggestions in the areas of selection, training, simulations, baseline data collection and mission operations. The report recognizes the contributions of the commander, payload commander and mission management team to the success of the mission. Dr. Buckey's main accomplishments during the mission are listed. DESIGNING FOR HUMAN PRESENCE IN SPACE: AN INTRODUCTION TO ENVIRONMENTAL CONTROL AND LIFE SUPPORT SYSTEMS
Paul Wieland Jan. 1994 355 p Sponsored by NASA, Washington
(NASA-RP-1324; M-735; NAS 1.61:1324) Avail: CASI HC A15/MF A03

Human exploration and utilization of space requires habitats to provide appropriate conditions for working and living. These conditions are provided by environmental control and life support systems (ECLSS) that ensure appropriate atmosphere composition, pressure, and temperature; manage and distribute water, process waste matter, provide fire detection and suppression; and other functions as necessary. The functions that are performed by ECLSS are described and basic information necessary to design an ECLSS is provided. Technical and programmatic aspects of designing and developing ECLSS for space habitats are described including descriptions of technologies, analysis methods, test requirements, program organization, documentation requirements, and the requirements imposed by medical, mission, safety, and system needs. The design and development process is described from initial trade studies through system-level analyses to support operation. ECLSS needs for future space habitats are also described. Extensive listings of references and related works provide sources for more detailed information on each aspect of ECLSS design and development. Author

ONE FROM MANY: SELECTING AN APPROPRIATE HUMAN PERFORMANCE MODEL
Mary Margaret Schuck 1993 8 p
(DCIEM-93-25; DSIS-94-00071; CTN-94-61117) Avail: CASI HC A02/MF A01

A wide variety of approaches exist for representing human behavior within an overall model of system performance. In modelling human performance, a model must be selected which not only answers the human performance problem identified, but which is also compatible with the overall system model. Blanchard and Fabrycky have suggested a six-step framework for selecting models for systems engineering studies. The first four steps of this framework are critical, and modifications are suggested to make them appropriate for models of human performance which are incorporated into an overall systems model. These steps are problem definition, identification of alternatives, selection of evaluation criteria, and application of modelling techniques. It is proposed to classify models according to their complexity, flexibility and generality, and to whether they have been validated successfully. This classification relies on a tradeoff between

complexity and the model's ability to be generalized into any system. This classification system, and the other modifications proposed, allow designers of human performance models to apply an existing engineering framework to the unique problems inherent in selecting human performance models.

A survey of distinct conceptual lunar habitat designs covering the pre- and post-Apollo era is presented. The impact of the significant lunar environmental challenges such as temperature, atmosphere, radiation, soil properties, meteorites, and seismic activity on the habitat design parameters are outlined. Over twenty habitat designs were identified and classified according to mission type, crew size; total duration of stay, modularity, environmental protection measures, and emplacement. Simple selection criteria of (1) post-Apollo design, (2) uniqueness of the habitat design, (3) level of thoroughness in design layout, (4) habitat dimensions are provided, and (5) materials of construction for the habitat shell are specified, are used to select five habitats for future trade studies. Habitat emplacement scenarios are created to examine the possible impact of emplacement of the habitat in different locations, such as lunar poles vs. equatorial, above ground vs. below ground, etc. Author (revised)

One of the most critical components of a space suit is the gloves, yet gloves have traditionally presented significant design challenges. With continued efforts at glove development, a method for evaluating glove performance is needed. This paper presents a pressure-glove evaluation protocol. A description of this evaluation protocol, and its development is provided. The protocol allows comparison of one glove design to another, or any one design to bare-handed performance. Gloves for higher pressure suits may be evaluated at current and future design pressures to drive out differences in performance due to pressure effects. Using this protocol, gloves may be evaluated during design to drive out design problems and determine areas for improvement, or fully mature designs may be evaluated with respect to mission requirements. Several different test configurations are presented to handle these cases. This protocol was run on a prototype glove. The prototype was evaluated at two operating pressures and in the unpressurized state, with results compared to bare-handed performance. Results and analysis from this test series are provided, as is a description of the configuration used for this test. Author (revised)

Continuous exposure to gravity may not be necessary to prevent the deconditioning effects of microgravity. It is not known, however, what the minimum gravity (G) exposure requirements are, whether they vary for different physiological systems, or whether passive Gz (gravity in the head-to-toe vector) or activity in a G field is more effective in preventing deconditioning. It is also not known what the optimal characteristics of the

G stimulus should be in terms of amplitude, duration, and frequency. To begin to address these questions, a 4-day -6 deg head-down bed rest (HDBR) study was conducted. Nine males (aged 30-50 yr) were subjected, over a period of seven months, to four different +1 Gz exposure protocols (periodic standing or controlled walking each for a total of 2 or 4 hr/day in individual 15-min doses), plus a control (0 Gz) of continuous HDBR. The study consisted of one ambulatory control day, 4 full days of -6 deg HDBR, and a recovery day when subjects were released at the end of HDBR after completion of tests. A battery of tests was selected and standardized in order to evaluate the known early responses to HDBR. Dependent variables of interest included orthostatic tolerance (30 min at 60 deg head-up tilt) and hemodynamics during head-up tilt, peak oxygen consumption (VO2(sub peak)) plasma volume (PV), and urinary calcium (Ca). The results were as follows: 4 hr standing completely prevented and 2 hr walking partially prevented post-HDBR orthostatic intolerance. Walking at 3 mi/hr for 4 hr/day provided no additional benefit. Intermittent walking attenuated, but did not prevent, the decrease in VO2(sub peak). Both 4 hr conditions showed less PV loss by the end of HDBR; both 2 hr conditions were without effect. Both 2 and 4 hr walking essentially prevented urinary Ca excretion and were more effective than standing. It is concluded that different physiological systems benefit differentially from passive +1 Gz or activity in +1 Gz, and the intensity of the stimulus may be an important contributing factor. This document is the proceedings from the fourth annual 'Space and Earth Science Data Compression Workshop,' which was held on April 2, 1994, at the University of Utah in Salt Lake City, Utah. This workshop was held in cooperation with the 1994 Data Compression Conference, which was held at Snowbird, Utah, March 29-31 1994. The Workshop explored opportunities for data compression to enhance the collection and analysis of space and Earth science data. It consisted of 13 papers presented in 4 sessions. The papers focus on data compression research that is integrated into, or has the potential to be integrated into, a particular space and/or Earth science data information system. Presenters were encouraged to take into account the scientist's data requirements, and the constraints imposed by the data collection, transmission, distribution, and archival system. For individual titles, see N94-28252 through N94-28264.

Avail: CASI HC A02/MF A02

This paper describes a study conducted by NASA Ames Research Center (ARC) in collaboration with the Jet Propulsion Laboratory (JPL), Pasadena, California on the image acceptability of the Galileo Low Gain Antenna mission. The primary objective of the study is to determine the impact of the Integer Cosine Transform (ICT) compression algorithm on Galilean images of atmospheric bodies, moons, asteroids and Jupiter's rings. The approach involved fifteen volunteer subjects representing twelve institutions involved with the Galileo Solid State Imaging (SSI) experiment. Four different experiment specific quantization tables (q-table) and various compression stepsizes (q-factor) to achieve different compression ratios were used. It then determined the acceptability of the compressed monochromatic astronomical images as evaluated by Galileo SSI mission scientists. Fourteen different images were evaluated. Each observer viewed two versions of the same image side by side on a high resolution monitor, each was compressed using a different quantization stepsize. They were requested to select which image had the highest overall quality to support them in carrying out their visual evaluations of image content. Then they rated both images using a scale from one to five on its judged degree of usefulness. Up to four pre-selected types of images were presented with and without noise to each subject based upon results of a previously administered survey of their image preferences. Fourteen different images in seven image groups were studied. The results showed that: (1) acceptable compression ratios vary widely with the type of images; (2) noisy images detract greatly from image acceptability and acceptable compression ratios; and (3) atmospheric images of Jupiter seem to have higher compression ratios of 4 to 5 times that of some clear surface satellite images. This paper describes the lossless and lossy image compression algorithms to be used on board the Solar Heliospheric Observatory (SOHO) in conjunction with the Large Angle Spectrometric Coronograph and Extreme Ultraviolet Imaging Telescope experiments. It also shows preliminary results obtained using similar prior imagery and discusses the lossy compression artifacts which will result. This paper is in part intended for the use of SOHO investigators who need to understand the results of SOHO compression in order to better allocate the transmission bits which they have been allocated. The commercial JPEG standard complies well with the specific requirements of exploratory space missions. Therefore, JPEG has been chosen to be the baseline for a series of spaceborne image data compressions (e.g. MARS94-HRSC, -WAOSS, HUYGENS-DISR, MESUR-IMP). One S/W-implementation (IMP) and one H/W-implementation (DISR) of image data compression are presented. Details of the modifications applied to standard JPEG are outlined. Finally, a performance comparison of the two implementations is given. Author (revised)

Developers of data compression algorithms typically use their own software together with commercial packages to implement, evaluate and demonstrate their work. While convenient for an individual developer, this approach makes it difficult to build on or use another's work without intimate knowledge of each component. When several people or groups work on different parts of the same problem, the larger view can be lost. What's needed is a simple piece of software to stand in the gap and link together the efforts of different people, enabling them to build on each other's work, and providing a base for engineers and scientists to evaluate the parts as a cohesive whole and make design decisions. AESOP (Advanced End-to-end Simulation for On-board Processing) attempts to meet this need by providing a graphical interface to a developer-selected set of algorithms, interfacing with compiled code and standalone programs, as well as procedures written in the IDL and PV-Wave command languages. As a proof of concept, AESOP is outfitted with several data compression algorithms integrating previous work on different processors (AT&T DSP32C, TI TMS320C30, SPARC). The user can specify at run-time the processor on which individual parts of the compression should run. Compressed data is then fed through simulated transmission and uncompression to evaluate the effects of compression parameters, noise and error correction algorithms. The following sections describe AESOP in detail. Section 2 describes fundamental goals for usability. Section 3 describes the implementation. Sections 4 through 5 describe how to add new functionality to the system and present the existing data compression algorithms. Sections 6 and 7 discuss portability and future work. Derived from text

PERFORMANCE CONSIDERATIONS FOR THE APPLICATION OF THE LOSSLESS BROWSE AND RESIDUAL MODEL **c61**
Walter D. Abbott, III, Robert T. Kay, and Ron J. Pieper *In* NASA. Goddard Space Flight Center, The 1994 Space and Earth Science Data Compression Workshop Apr. 1994 p 43-54 (For primary document see N94-28251 07-59)
Avail: CASI HC A03/MF A02

A hybrid lossless compression model employing both the (lossy) JPEG DCT algorithm and one of a selection of lossless image compression methods has been tested. The hybrid model decomposes the original image into a low-loss quick-look browse and a residual image. The lossless compression methods tested in the model are Huffman, arithmetic, LZW, lossless JPEG, and diagonal coding. For both the direct and the hybrid application of these lossless methods, the compression ratios (CR's) are calculated and compared on three test images. For each lossless method tested, the hybrid model had no more than a nominal loss in compression efficiency relative to the direct approach. In many cases, the hybrid model provided a significant compression gain. When used in the hybrid model, lossless JPEG outperformed the other lossless methods over a broad range of browse image qualities. Author (revised)

A number of quality measures are evaluated for gray scale image compression. They are all bivariate exploiting the differences between corresponding pixels in the original and degraded images. It is shown that although some numerical measures correlate well with the observers' response for a given compression technique, they are not reliable for an evaluation across different techniques. The two graphical measures (histograms and Hosaka plots), however, can be used to appropriately specify not only the amount, but also the type of degradation in reconstructed images. A COMPARISON OF SPECTRAL DECORRELATION TECHNIQUES AND PERFORMANCE EVALUATION METRICS FOR A WAVELET-BASED, MULTISPECTRAL DATA COMPRESSION ALGORITHM **c61**
Roy M. Matic and Judith I. Mosley (Santa Barbara Research Center, Goleta, CA.) *In* NASA. Goddard Space Flight Center, The 1994 Space and Earth Science Data Compression Workshop Apr. 1994 p 69-80 (For primary document see N94-28251 07-59)
Avail: CASI HC A03/MF A02

Future space-based, remote sensing systems will have data transmission requirements that exceed available downlinks necessitating the use of lossy compression techniques for multispectral data. In this paper, we describe several algorithms for lossy compression of multispectral data which combine spectral decorrelation techniques with an adaptive, wavelet-based, image compression algorithm to exploit both spectral and spatial correlation. We compare the performance of several different spectral decorrelation techniques including wavelet transformation in the spectral dimension. The performance of each technique is evaluated at compression ratios ranging from 4:1 to 16:1. Performance measures used are visual examination, conventional distortion measures, and multispectral classification results. We also introduce a family of distortion metrics that are designed to quantify and predict the effect of compression artifacts on multi spectral classification of the reconstructed data. A COMPARATIVE STUDY OF SAR DATA COMPRESSION SCHEMES **c61**
C. Lambert-Nebout, O. Besson (Ecole Nationale Superieure d'Ingenieurs de Constructions Aeronautiques, Toulouse, France.), D. Massonnet, and B. Rogron *In* NASA. Goddard Space Flight Center, The 1994 Space and Earth Science Data Compression Workshop Apr. 1994 p 81-91 (For primary document see N94-28251 07-59)
Avail: CASI HC A03/MF A02

The amount of data collected from spaceborne remote sensing has substantially increased in the last years. During same time period, the ability to store or transmit data has not increased as quickly. At this time, there is a growing interest in developing compression schemes that could provide both higher compression ratios and lower encoding/decoding errors. In the case of the spaceborne Synthetic Aperture Radar (SAR) earth observation system developed by the French Space Agency (CNES), the volume of data to be processed will exceed both the on-board storage capacities and the telecommunication link. The objective of this paper is twofold: to present various compression schemes adapted to SAR data; and to define a set of evaluation criteria and compare the algorithms on SAR data. In this paper, we review two classical methods of SAR data compression and propose novel approaches based on Fourier Transforms and spectrum coding. Author (revised)

PERCEPTUAL COMPRESSION OF MAGNITUDE-DETECTED SYNTHETIC APERTURE RADAR IMAGERY **c61**
John D. Gorman and Susan A. Werness *In* NASA. Goddard Space Flight Center, The 1994 Space and Earth Science Data Compression Workshop Apr. 1994 p 93-103 (For primary document see N94-28251 07-59)
Avail: CASI HC A03/MF A02

A perceptually-based approach for compressing synthetic aperture radar (SAR) imagery is presented. Key components of the approach are a multiresolution wavelet transform, a bit allocation mask based on an empirical human visual system (HVS) model, and hybrid scalar/vector quantization. Specifically, wavelet shrinkage techniques are used to segregate wavelet transform coefficients into three components: local means, edges, and texture. Each of these three components is then quantized separately according to a perceptually-based bit allocation scheme. Wavelet coefficients associated with local means and edges are quantized using high-rate scalar quantization while texture information is quantized using low-rate vector quantization. The impact of the perceptually-based multiresolution compression algorithm on visual image quality, impulse response, and texture properties is assessed for fine-resolution magnitude-detected SAR imagery; excellent image quality is found at bit rates at or above 1 bpp along with graceful performance degradation at rates below 1 bpp. Author (revised)

COMPRESSION OF MULTISPECTRAL LANDSAT IMAGERY USING THE EMBEDDED ZEROTREE WAVELET (EZW) ALGORITHM **c61**
Jerome M. Shapiro, Stephen A. Martucci, and Martin Czigler *In* NASA. Goddard Space Flight Center, The 1994 Space and Earth Science Data Compression Workshop Apr. 1994 p 105-113 (For primary document see N94-28251 07-59)
Avail: CASI HC A02/MF A02

The Embedded Zerotree Wavelet (EZW) algorithm has proven to be an extremely efficient and flexible compression algorithm for low bit rate image coding. The embedding algorithm attempts to order the bits in the bit stream in numerical importance and thus a given code contains all lower rate encodings of the same algorithm. Therefore, precise bit rate control is achievable and a target rate or distortion metric can be met exactly. Furthermore, the technique is fully image adaptive. An algorithm for multispectral image compression which combines the spectral redundancy removal properties of the image-dependent Karhunen-Loeve Transform (KLT) with the efficiency, controllability, and adaptivity of the embedded zerotree wavelet algorithm is presented. Results are shown which illustrate the advantage of jointly encoding spectral components using the KLT and EZW. Author (revised)

VECTOR QUANTIZER DESIGNS FOR JOINT COMPRESSION AND TERRAIN CATEGORIZATION OF MULTISPECTRAL IMAGERY **c61**
John D. Gorman and Daniel F. Lyons (Mitre Corp., McLean, VA.) *In* NASA. Goddard Space Flight Center, The 1994 Space and Earth Science Data Compression Workshop Apr. 1994 p 115-121 (For primary document see N94-28251 07-59)
Avail: CASI HC A02/MF A02

Two vector quantizer designs for compression of multispectral imagery and their impact on terrain categorization performance are evaluated. The mean-squared error (MSE) and classification performance of the two quantizers are compared, and it is shown that a simple two-stage design minimizing MSE subject to a constraint on classification performance has a significantly better classification performance than a standard MSE-based tree-structured vector quantizer followed by maximum likelihood classification. This improvement in classification performance is obtained with minimal loss in MSE performance. The results show that it is advantageous to tailor compression algorithm designs to the required data exploitation tasks. Applications of joint compression/classification include compression for the archival or transmission of Landsat imagery that is later used for land utility surveys and/or radiometric analysis. WAVELET COMPRESSION TECHNIQUES FOR HYPERSPECTRAL DATA **c61**
Bruce Evans, Brian Ringer, and Mathew Yeates *In* NASA. Goddard Space Flight Center, The 1994 Space and Earth Science Data Compression Workshop Apr. 1994 p 123-133 (For primary document see N94-28251 07-59)
Avail: CASI HC A03/MF A02

Hyperspectral sensors are electro-optic sensors which typically operate in visible and near infrared bands. Their characteristic property is the ability to resolve a relatively large number (i.e., tens to hundreds) of contiguous spectral bands to produce a detailed profile of the electromagnetic spectrum. In contrast, multispectral sensors measure relatively few non-contiguous spectral bands. Like multispectral sensors, hyperspectral sensors are often also imaging sensors, measuring spectra over an array of spatial resolution cells. The data produced may thus be viewed as a three dimensional array of samples in which two dimensions correspond to spatial position and the third to wavelength. Because they multiply the already large storage/transmission bandwidth requirements of conventional digital images, hyperspectral sensors generate formidable torrents of data. Their fine spectral resolution typically results in high redundancy in the spectral dimension, so that hyperspectral data sets are excellent candidates for compression. Although there have been a number of studies of compression algorithms for multispectral data, we are not aware of any published results for hyperspectral data. Three algorithms for hyperspectral data compression are compared. They were selected as representatives of three major approaches for extending conventional lossy image compression techniques to hyperspectral data. The simplest approach treats the data as an ensemble of images and compresses each image independently, ignoring the correlation between spectral bands. The second approach transforms the data to decorrelate the spectral bands, and then compresses the transformed data as a set of independent images. The third approach directly generalizes two-dimensional transform coding by applying a three-dimensional transform as part of the usual transform-quantize-entropy code procedure. The algorithms studied all use the discrete wavelet transform. In the first two cases, a wavelet transform coder was used for the two-dimensional compression. The third case used a three dimensional extension of this same algorithm. Author (revised)

SOME PRACTICAL ASPECTS OF LOSSLESS AND NEARLY-LOSSLESS COMPRESSION OF AVHRR IMAGERY **c61**
David B. Hogan, Chris X. Miller, Than Lee Christensen, and Raj Moorti *In* NASA. Goddard Space Flight Center, The 1994 Space and Earth Science Data Compression Workshop Apr. 1994 p 135-142 (For primary document see N94-28251 07-59)
Avail: CASI HC A02/MF A02

Compression of Advanced Very high Resolution Radiometers (AVHRR) imagery operating in a lossless or nearly-lossless mode is evaluated. Several practical issues are analyzed including: variability of compression over time and among channels, rate-smoothing buffer size, multi-spectral preprocessing of data, day/night handling, and impact on key operational data applications. This analysis is based on a DPCM algorithm employing the Universal Noiseless Coder, which is a candidate for inclusion in many future remote sensing systems. It is shown that compression rates of about 2:1 (daytime) can be achieved with modest buffer sizes (less than or equal to 2.5 Mbytes) and a relatively simple multi-spectral preprocessing step. DEVELOPMENT OF A 4-BIT PARALLEL ANALOG-TO-DIGITAL CONVERTER AND A FOUR-QUADRANT DOUBLE-BALANCED MIXER USING HETEROJUNCTION BIPOLAR TRANSISTOR TECHNOLOGY M.S. Thesis
Scott F. Jokerst Dec. 1993 123 p
(AD-A274074; AFIT/GE/Eng/93D-16) Avail: CASI HC A06/MF A02

A four-bit parallel analog-to-digital converter (ADC) and a four-quadrant double-balanced mixer were designed and simulated using heterojunction bipolar transistor (HBT) technology to test the dc and high-frequency characteristics of HBT's. HSPICE simulations of small-scale components and the large-scale ADC operated within expected ranges. The ADC implemented with the Rockwell HBT model operated at a sampling rate of over 1 GHz, and the Fellows model also operated at a 1 GHz sampling rate. The mixer produced an intermediate frequency (IF) signal using radio frequency (RF) and local oscillator (LO) inputs. The circuit produced a +9 dB power gain with less than one percent harmonic distortion and shows potential for microwave applications. In order to facilitate the fabrication of HBT circuits, a Magic technology file was developed to lay out HBT's and extract the transistors for the purpose of doing a layout versus schematic check. The extraction software was altered to recognize HBT's in the extracted file. The program ext2spice successfully identified HBT's and converted the transistors, as well as parasitic capacitances, into an HSPICE netlist. Since load resistors determine the output logic swing in current-mode logic, an attempt was made to extract resistors using the HBT technology file for Magic. The configuration of the HBT within Magic and the methods used for resistance extraction offer ways to extract HSPICE netlists for accurate simulations. DTIC

EXTENDING THE RULE SPACE MODEL TO A SEMANTICALLY-RICH DOMAIN: DIAGNOSTIC ASSESSMENT IN ARCHITECTURE Final Report, Apr. 1989 - Aug. 1993
Irvin R. Katz, Michael E. Martinez, Kathleen Sheehan, and Kikumi K. Tatsuoka Oct. 1993 40 p
(Contract N00014-90-J-1307)
(AD-A273789; ETS-RR-93-42-ONR) Avail: CASI HC A03/MF A01

A technique is presented for applying the Rule Space model of cognitive diagnosis to assessment in a semantically-rich domain. Responses to 22 architecture test items, developed to assess a range of architectural knowledge, were analyzed using Rule Space. Verbal protocol analyses guided the construction of a model of examinee performance, consisting of processes for constructing an initial representation of an item - labeled understand; forming goals and performing actions based on those goals - solve; and determining whether goals have been attempted and satisfied - check. Item attributes, derived from these processes, formed the basis for diagnosis. The technique extends Rule Space's applicability by defining attributes in terms of item characteristics and the causal relations between characteristics and the problem-solving model. Data were collected from 122 architects of various ability levels (students, architecture interns, and professional architects). Rule Space successfully classified approximately 65%, 90%, and 40% of examinees based, respectively, on attributes associated with the understand, solve, and check processes of the problem-solving model. The findings support the effectiveness of Rule Space in a complex domain and suggest directions for developing new architecture items by using attributes particularly effective at distinguishing among examinees of different ability levels. TEMPERATURE DEPENDENCE OF STATIC RAM VOLATILITY
T. L. Meisenheimer, D. M. Fleetwood, and P. S. Winokur 1993 5 p
Presented at the Hardened Electronics and Radiation Technology, Monterey, CA, 14-18 Feb. 1994
(Contract DE-AC04-76DP-00789)
(DE93-040345; SAND-93-1926C; CONF-940217-1) Avail: CASI HC A01/MF A01

We have measured the temperature dependence of the volatility of a wide variety of static RAMS. The temperature dependence is directly related to the memory cell design and device processing or fabrication parameters. We have seen the volatility change by approximately 10 orders of magnitude when the absolute temperature is changed by a factor of approximately 2. We present physical reasons for such a large temperature dependence and derive an analytical model which accurately predicts the volatility. Neutron irradiation is seen to increase the low-temperature volatility. DOE

(DE94-004351; UCRL-JC-115318; CONF-931115-13) Avail: CASI HC A03/MF A01

The National Storage Laboratory (NSL) was organized to develop, demonstrate and commercialize technology for the storage system that will be the future repositories for our national information assets. Within the NSL four Department of Energy laboratories and IBM Federal System Company have pooled their resources to develop an entirely new High Performance Storage System (HPSS). The HPSS project concentrates on scalable parallel storage system for highly parallel computers as well as traditional supercomputers and workstation clusters. Concentrating on meeting the high end of storage system and data management requirements, HPSS is designed using network-connected storage devices to transfer data at rates of 100 million bytes per second and beyond. The resulting products will be portable to many vendor's platforms. The three year project is targeted to be complete in 1995. This paper provides an overview of the requirements, design issues, and architecture of HPSS, as well as a description of the distributed, multi-organization industry and national laboratory HPSS project. Future plans for space exploration call for scientific instruments whose data is increasingly voluminous, far exceeding constraints set by telemetry rates, and therefore, an increased role for spaceborne computing. Three issues that greatly influence the realization of spaceborne computing systems are addressed. The first involves the identification of those research problems which are unique to space computing. Resources must be expended on these problems if efforts are to add value to, and have impact on, the technology of computing in space. The second addresses the transfer of new technology from the research laboratory to use in space. What can be done to expedite this process and shrink the technology gap that separates Earth and space based systems must be assessed. The third issue involves the user's point of view of what is required of new space computing systems. That is, what are the driving forces that most influence customers' decisions to use or not use new technology? Issues of design environment for spaceborne computers, tools for modeling and evaluation of flight systems, and validation of space flight hardware and software are also discussed. ESA

DEVELOPMENT OF A MIL-STD-1750 MICROPROCESSOR SYSTEM FOR SPACE APPLICATIONS

D. Mead and A. L. R. Pouponnot (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.) *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 29-40 (For primary document see N94-26713 07-60)

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

An overview of the ESA development program for the MA31750 microprocessor system is presented. Objectives were to design and manufacture a high performance radiation hard microprocessor for onboard space applications with a computing power of 3 million instructions per second, a low pin count to minimize the board area, and power consumption of less than 0.5 W. The justification for the selected approach, the main characteristics of the microprocessor system, the present status of the development, and the continuation of the development work are described. The development of complementary elements is outlined: an Error Detection and Correction unit (EDAC) named MA31752, a Direct Memory Access Controller (DMAC) named MA31753, and a Processor Support Circuit (PSC) named MA31754; VHDL (VHSIC (Very High Speed Integrated Circuit) Hardware Description Language) for the MA31750 chip set; a Software Development Environment (SDE) for the microprocessor system. The development of an advanced space flight computer for real time embedded deep space applications which embodies the lessons learned on Galileo and modern computer technology is described. The requirements are listed and the design implementation that meets those requirements is described. The development of SPACE-16 (Spaceborne Advanced Computing Engine) (where 16 designates the databus width) was initiated to support the MM2 (Marine Mark 2) project. The computer is based on a radiation hardened emulation of a modern 32 bit microprocessor and its family of support devices including a high performance floating point accelerator. Additional custom devices which include a coprocessor to improve input/output capabilities, a memory interface chip, and an additional support chip that provide management of all fault tolerant features, are described. Detailed supporting analyses and rationale which justifies specific design and architectural decisions are provided. The six chip types were designed and fabricated. Testing and evaluation of a brass/board was initiated. ESA

The Advanced Spaceborne Computer Module (ASCM) program, a program which is designed to extend and validate the Qualification Manufacturers Listing (QML) methodology for producing space qualified Very High Speed Integrated Circuit (VHSIC) devices, is described. The ASCM program is a flagship Total Quality Management (TQM) program to validate a major change in qualification methods. The QML methodology significantly reduces destructive end of line testing, thereby, reducing overall individual circuit costs, while maintaining no less a quality product. The program includes some extensive end of line testing formerly performed for the Qualified Product List (QPL), Class S qualification. This information was used for correlation between the two methodologies. The development and demonstration of the qualification methodology was performed by producing devices on the commercial fabrication line for space qualified flight hardware. The first deliverables were based on an advanced MIL-STD-1750A processor with post radiation throughput requirements of 3 to 5 million instructions per second. This product was structured to allow for use of technologies such as radiation hardened 64 K Static Random Access Memories (SRAM's) and the Generic VHSIC Spaceborne Computer (GVSC) class MIL-STD-1750A processors. The physical, electrical package, and interoperability requirements for ASCM were defined. The principal elements are: intramodule bus; spacecraft bus; host interface; and telemetry. ESA

FAULT TOLERANT REAL-TIME PROCESSING SYSTEM FOR SPACE USE

Tamotsu Onozawa, Yasuo Morimoto, Tsunekazu Kimura, and Nobuyoshi Hayashi *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 89-99 (For primary document see N94-26713 07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

The Fault tolerant Real time Processing System (FRPS) for onboard space applications, such as for the Japanese HOPE (H2 Orbiting Plane), is described. The FRPS meets requirements by the following design concepts: powerful microprocessor with a general purpose architecture; fault tolerant functions organized systematically and hierarchically; balanced hardware and software; software functions controlling hardware realized by support programs such as outer OS (Operating System); and upward compatible extension of C language called 'real time C' for concurrent programming. The performance and configuration, architecture, fault tolerant feature, system software, software development environment, and verification environment are described. ESA

A study to redefine and reimplement the Ada Tasking Coprocessor (ATAC) is described. The resulting ATAC 2.0 architecture and its VLSI (Very Large Scale Integration) implementation are outlined. The ATAC 2.0 architecture is neutral enough to allow efficient integration in existing lines of compilers and has a high degree of transparency with respect to hardware environments. The ATAC is a memory mapped device, to permit flexibility of use with various types of microprocessors. Exception handling, internal interrupt management, and managing time are described. The ATAC does not implement general exception handling support, but it handles exception 'propagation' between tasks and detection of the task related predefined exceptions. The purpose of integrating an interrupt controller with the ATAC was to cut down on the three interrelated problem areas: lock-out, latency, and priority inversion. The desire was also to support interrupts in a way that is fully in line with the Ada tasking model. An internal time manager handles delays and the time-of-day needed to implement the Calendar and the Clock, using the same 64 bit clock. For the VLSI implementation, the main building blocks, signal interface, bus transactions, instruction sequencing, and external task data base memories, are described. ESA

The choices presiding in the specification of the onboard computer (software and hardware) architecture of the SPOT 4 satellite are presented, and the software architecture is described. The three principles which guided the SPOT 4 designers are described: requirements related to system security; system observability requirements; and onboard software predictability and determinism requirements. The onboard architecture of SPOT 4 is characterized by the following: modularity of hardware architecture, which ensures on-board safety by minimal dimensioning of onboard software, and on-ground investigations in the case of breakdowns; and the finest possible reconfigurations. The structure of its central software, its cyclical character, guarantee of its predictability, introduces a high testability level, without any mission limitation. ESA

The NASA Small Explorer Data System (SEDS), a space flight data system developed to support the Small Explorer (SMEX) project, is addressed. The system was flown on the Solar Anomalous Magnetospheric Particle Explorer (SAMPEX) SMEX mission, and with reconfiguration for different requirements will fly on the X-ray Timing Explorer (XTE) and the Tropical Rainfall Measuring Mission (TRMM). SEDS is also foreseen for the Hubble repair mission. Its name was changed to Spacecraft Data System (SDS) in view of expansions. Objectives, SDS hardware, and software are described. Each SDS box contains two computers, data storage memory, uplink (command) reception circuitry, downlink (telemetry) encoding circuitry, Instrument Telemetry Controller (ITC), and spacecraft timing circuitry. The SDS communicates with other subsystems over the MIL-STD-1773 data bus. The SDS software uses a real time Operating System (OS) and the C language. The OS layer, communications and scheduling layer, application task layer, and diagnostic software, are described. Decisions on the use of advanced technologies, such as ASIC's (Application Specific Integrated Circuits) and fiber optics, led to technical improvements, such as lower power and weight, without increasing the risk associated with the data system. The result was a successful SAMPEX development, integration and test, and mission using SEDS, and the upgrading of that system to SDS for TRMM and XTE. ESA

THE ARIANE 5 DATA MANAGEMENT SYSTEM
Yves Durand, Jean-Marie Pasquet, and Jean-Noel Monfort *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 141-151 (For primary document see N94-26713 07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

The various classes of real time constraints associated with the Ariane 5 onboard avionics are introduced, and the architecture that was found adequate to meet these specifications, as well as the associated industrial constraints, are described. The Ariane 5 program is still midpoint in its development and the real time system characteristics, depending on final hardware and software performances, are not available yet. However, the design drivers and the methods used to specify, control, and validate the real time system performances of the onboard avionics are outlined. ESA

The flight software for PRONAOS (French acronym for national program of submillimeter astronomy) is addressed. Space applications use more and more sophisticated (and expensive) onboard computers. The PRONAOS project (as well as other science projects) cannot afford such architectures and is to use only classical, almost old fashioned, solutions. The main effort is made on software and methodology, to realize the required functions with the required performance. PRONAOS scientific aims, environment, and global architecture are presented, and the main onboard software (called LV NAPS (NAPS (French acronym for PRONAOS stabilized balloon gondola))), the associated computer architecture, and its main algorithms, are described. The main methodological principles in use for the software development are presented, and how they helped to reach the project's goals is discussed. ESA

The Silex (Semiconductor laser Intersatellite Link Experiment) On Board Processor (OBP) is a real time processing equipment designed for SPOT 4 and Artemis (Advanced Relay Technological Mission Satellite) platforms. The OBP unit is in charge of the management, control, and measurement of the Silex equipments. The Silex On Board Software (OBS) provides classical mission management facilities, and supports pointing control loops, where stringent multitasking and real time performance are required. The OBP terminal data bus supports asynchronous data exchange with reference to the CPU (Central Processing Unit) real time process. In case of major failure, the OBP is tasked to switch the entire Silex experiment to a safe position. The requirements imposed on the OBP equipment, the resulting architecture of the unit, and the various advanced state of the art technologies employed to meet these functions, such as thick film hybrids, ceramic mounted high density RAM (Random Access Memory), and FPGA (Field Programmable Gate Arrays)devices, are described. The OBP and OBS design and development philosophy to arrive at cost effective solutions which, owing to their modular construction, could be reused with little or no modification for other projects, are described. These are assets which make the OBP/OBS concept versatile, and thus it could be considered as a baseline product for future projects, including those in other fields of applications. ESA

ON-BOARD SOFTWARE FOR THE JET-X TELESCOPE ON THE SPECTRUM-X MISSION **c61**

M. D. Bull, C. J. Eyles, and O. Emam *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 185-200 Sponsored by Science Research Council (For primary document see N94-26713 07-60)

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

JET-X, the Joint European X Ray Telescope, is one of the core instruments on the Russian Spectrum Roentgen (x ray) Gamma (SRG) high energy astrophysics mission. The instrument comprises two coaligned grazing incidence x ray telescopes, using x ray sensitive charge coupled devices (CCD's) as focal plane detectors. The SRG spacecraft will be launched into a highly eccentric four day orbit with ground contacts for periods of approximately 2 hours every 24 hours. The JET-X onboard data handling system is based on a network of four 80C86 processors, interconnected via serial links, and includes a 60 Mbyte mass memory to store data between ground contacts. The embedded software performs real time processing of the image data from the various CCD detectors in order to reduce the very high data rates produced to a value consistent with the size of the mass memory. It was designed with particular attention to the requirement for reliable, autonomous operation during the 24 hour periods between ground contacts. ESA

SCHEDULING TASKS WITH UNPREDICTABLE TIMING PARAMETERS IN HARD REAL-TIME SYSTEMS **c61**

Maryline Silly *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 203-210 (For primary document see N94-26713 07-60)

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

The problem of guaranteeing response times to periodic and sporadic tasks even under transient overloads and a solution using the deadline mechanism to provide tradeoffs among time and precision are addressed. Hard real time systems are characterized by their timing constraints because they are responsible for safety and time critical control systems such as aircraft, nuclear systems, etc. The software of such systems features a large number of tasks said to be time critical because they must start at a required time and produce results before a certain deadline. One of the most important design issues in a real time system is to schedule tasks to meet their deadlines, which requires a formal performance evaluation of the system. Solutions used today for a large proportion of systems are static in that they assume complete and prior knowledge of all the tasks and make static decisions. Unfortunately, next generation systems are more complex and dynamic. Notably, determination of task execution time is very difficult and arrival time of sporadic tasks is unpredictable. In these systems, the fluctuations in both the rate and magnitude of service demands may dynamically overload the computing system and thus entail deadline misses which is inacceptable in a hard real time environment. One approach to cope with the problem of transient system overload is to use the deadline mechanism combined with an efficient scheduling strategy so all deadlines are guaranteed to be met under all circumstances. The deadline mechanism provides two implementation versions for a task which differ only in the amount of processor time they consume and the precision of the results that they return. ESA

STANDARDIZE Ada HARD REAL-TIME SERVICES? **c61**

Dominique L. R. Chandesris, Vincent Celier, and Nasser Kettani *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 211-221 (For primary document see N94-26713 07-60)

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

Technical issues raised by the use of Ada for hard real time (HRT) systems are examined: All the solutions proposed for increasing the success of this programming language within the HRT community are not examined, only the secondary standard solution is analyzed. The International Standards Organization (ISO) Real Time Rapporteur Group (RRG) goals and objectives are presented, and the RRG proposal approach is illustrated by an example: distribution and multiprogramming. The secondary standard approach is understood to be the best pragmatic compromise between continuous language changes and conservative and strict language maintenance. Belief is that the Ada HRT community needs standardized HRT services for Ada and that the secondary standard approach is the best one. This secondary standard must have a validation process, including metrics, for the users to be able trust the future products implementing the RRG standard. An implementation of the future secondary standard is under development. ESA

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

Ada implementation of the integrated modular avionics (IMA) is addressed. IMA puts the accent on three types of requirements found in avionic and space projects: hard real time, safety systems, and multiprogramming. The principal results of the formal method rate monotonic analysis (RMA) are outlined. In applying RMA to an Ada multiprogram system, a scheduling method simultaneously for programs and tasks satisfying IMA criteria must be developed. A multiprogram scheduling conforming to RMA analysis is proposed and a second model more appropriate to the IMA concept is described. The real time executive certification procedures and current and future standards of the IMA support concept and RMA with the Ada language are discussed. ESA

IMPLEMENTING HARD REAL-TIME SYSTEMS: A CASE STUDY **c61**

C. M. Bailey, A. Burns (York Univ., England.), E. Fyfe, F. Gomez-Molinero (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.), and A. J. Wellings (York Univ., England.) *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 235-249 (For primary document see N94-26713 07-60)

(Contract ESTEC-9198/90/NL/SF)

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

A case study implementation of a proposed scheduling approach for single processor space applications is presented. The use of a modification of the Ada tasking model, using asynchronous communication via a passive monitor-like abstraction and supporting 'time-fences' to prevent an application from executing more CPU cycles than was allowed for in the prerun time analysis of its worst case execution time, was investigated. The approach to scheduling is based on preemptive priority based dispatching. Priorities are assigned according to the deadline monotonic scheme. To support the proposed scheduling, a hard real time hierarchical object oriented design (HRT-HOOD) method was developed. HRT-HOOD, which builds on the foundations of HOOD, recognizes sporadic and cyclic objects, and 'protected' objects which facilitate object interactions but only in ways that can be analyzed for their temporal behavior. A proof of concept implementation of the normal mode of operation of the Olympus AOCS (Attitude and Orbital Control System), that is the attitude control loops and associated telemetry and telecommand handling, is described and the scheduling approach is assessed. ESA

TOOL FOR PERFORMANCE ANALYSIS AND OFF-LINE PREDICTION OF TIMING BEHAVIOUR
E. Mesnard and Y. Trinquet *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 251-259 In FRENCH (For primary document see N94-26713 07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

An analysis of real time system timing behavior, to provide a design aid for such systems to enable them to verify a priori if certain timing characteristics conform to their specifications, is presented. The study is part of a more general framework enabling a characteristic graph of program execution to be obtained using a program written in the C language (program dependance graph). The approach described belongs to the asynchronous system framework but an application model imposing constraints in the algorithmic description of the application and an execution model using a non-preemptive scheduling mode are described. An analysis model, using a graph, allows the offline study of timing behavior of the application and the verification of whether the timing constraints are verified. ESA

A REAL-TIME EXECUTIVE IMPLEMENTING PRIORITY INHERITANCE PROTOCOLS **c61**
S. Sabina, R. Chiaverini, and C. Migliorini *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 261-271 (For primary document see N94-26713 07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

A priority model and a task model of an 'executive' suitable for hard real time environments are presented. Preemptive scheduling algorithms are generally used for managing concurrency on large and complex monoprocessor systems. However, they lead to nondeterministic system execution times and unpredictable system timing behavior. The main cause of unpredictability is the so called priority inversion problem. It occurs when a high priority task is forced to wait for the execution of a lower priority task. To overcome the drawback of unpredictability, the use of hard real time scheduling algorithms, for example the rate monotonic, or the deadline monotonic with priority inheritance, is required. This class of scheduling algorithms sets upper bounds to the duration of priority inversion, and thus leads to analyzable systems. A priority model and a task model suitable for the implementation of hard real time scheduling algorithms in an executive, and the main design issues to be taken into account in the implementation of the basic priority inheritance protocol, are presented. ESA

SCHEDULING APPROACHES WITH Ada **c61**
R. Devillers, D. DeLucca, J. Beaufays (TRASYS Space, Brussels, Belgium.), and E. Snyers (TRASYS Space, Brussels, Belgium.) *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 273-283 (For primary document see N94-26713 07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

A project aiming to analyze and compare different approaches for hard real time scheduling in Ada is reported. Three different approaches for process scheduling were analyzed and implemented in Ada: the traditional cyclic executive; the rate monotonic scheduling; and the deadline monotonic sheduling. To perform this comparison, a reference application was developed involving the cyclic execution of a set of periodic processes with different frequencies and the response of the system to aperiodic requests with different response times. The practical application of the three different scheduling approaches in Ada, with respect to their time correctness, flexibility, and complexity, is discussed. ESA

FAULT-TOLERANT SCHEDULING IN DISTRIBUTED CRITICAL REAL-TIME SYSTEMS **c61**
Houssine Chetto *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 285-295 (For primary document see N94-26713 07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

A real time system is said to be hard if a failure to meet the timing constraints imposed on the software will result in property damage or even in a loss of human life. A key issue in the design of such a system is to determine an appropriate fault tolerant mechanism so that the occurrence of any erroneous state does not result in a timing failure (deadline missing) and, consequently, allows an acceptable although degraded performance to be guaranteed. A study in which the deadline mechanism, which is a variation of the recovery block scheme and is used to support timing fault tolerance, is presented. The deadline mechanism and implementation considerations in a distributed system are considered and a strategy for task allocation and dynamic reconfiguration is presented. ESA

EARLY REAL-TIME PERFORMANCE MEASUREMENTS ON THE COLUMBUS PROCESSOR SYSTEM
G. Birnbaum, P. Humbert, T. Jourdan, and C. Renoux *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 299-317 (For primary document see N94-26713 07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

To fulfill its 30 year space station mission with regard to the variety of its users (crew work station, data storage and retrieval, mission management, and subsystem control), the Columbus processor system, called Processing Node Drawer (PND), provides a large set of powerful and reliable processing, communications, and peripheral interface building blocks. The PND is a catalyst which allows the standardization offered by commercial techniques and products to be applied to space applications and users. The full range of space environmental conditions and design rules are incorporated, not added afterwards. All PND dynamic performance predictions take into account an operation in worst case conditions and an in-orbit lifetime of ten years. Predevelopment of common building blocks such as the Network Interface Unit, the Columbus Operating System, the Space NuBus, and associated hardware and software have increased confidence in the feasibility of this distributed and open computing solution. A study within the greater framework of developing AQUARELS (French acronym for workshop on numerical quality for scientific software realization) is presented. The trajectory determination of a space vehicle is generally computed by ground stations with mainframes or workstations. However, for future projects, this 'scientific processing' component (extended Kalman filter, ordinary differential equations, and intensive use of the elementary functions: sin, cos, sqrt, e to the power x, etc.) will be on board and it is important to evaluate the arithmetic performances of the onboard processors available for these missions. Tools to evaluate the basic parameters of an arithmetic unit, and a synthesis of results of the microprocessor evaluation for the Hermes project are described. ESA

N94-26739 MATRA Marconi Space, Toulouse (France).
VERIFICATION AND VALIDATION OF THE ON-BOARD SOFTWARE REAL TIME REQUIREMENTS [LA VERIFICATION ET LA VALIDATION DES EXIGENCES TEMPS REEL DU LOGICIEL TEMPS SPATIAL EMBARQUE] **c61**
Jean-Louis Dega, Jean Jacques Montiel, and Bruno Vatan *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 341-353 In FRENCH (For primary document see N94-26713 07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

An assessment of the verification and validation of space embedded software and ground segment facilities is presented. Focus is on: the generic philosophy of the actual software validation facilities to test the operational requirements (and particularly the real time requirements) at each step of the building of a software component from the low level ones to the complete software; the constraints imposed on the test environment by the real time code under test; positioning for reducing cost and time consumption in the verification and validation process of these real time requirements. This flashback on the verification and validation process covers the satellite software such as those of the telecommunication satellites, the SPOT family, Hipparcos, and ERS. It shows how this experience gained during more than 10 years permits tackling of the new generation of these complex systems such as Hermes and Columbus. To allow the test of the real time requirements of these more and more large and complex softwares and to avoid an excessive increase of costs, it is necessary: to build the verification tools of these requirements and to use it early in the development cycle; to reuse these tools along the development and the verification in order to update the requirements as soon as first tests results appear; and to define a new generic philosophy of reusing verification and validation components from the low level software test facilities to the complete software test facilities including in house facilities to large test result analysis. FORMAL METHODS FOR DEPENDABLE REAL-TIME SYSTEMS
John Rushby *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 355-366 (For primary document see N94-26713 07-60)
(Contracts NAS1-18266; NAS1-18969; N00014-92-C-2177)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

The motivation for using formal methods to specify and reason about real time properties is outlined and approaches that were proposed and used are sketched. The formal verifications of clock synchronization algorithms are concluded as showing that mechanically supported reasoning about complex real time behavior is feasible. However, there was significant increase in the effectiveness of verification systems since those verifications were performed, at it is to be expected that verifications of comparable difficulty will become fairly routine. The current challenge lies in developing perspicuous and economical approaches to the formalization and specification of real time properties. ESA

DEVELOPING WITH Ada USING HOOD DESIGN METHODOLOGY **c61**
K. Baeuerle, U. Denskat, and J. Garbers *In* CNES, Real-Time Embedded Processing for Space Applications Apr. 1993 p 369-379 (For primary document see N94-26713 07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

Experiences gained when developing Ada software for a high reliable application on a real time embedded system using the HOOD (Hierarchical Object Oriented Design) design methodology are described. A two way approach is used in summarizing the encountered problems. Discrepancies existing between requirements for high performance, high reliability and hierarchical object oriented design, are identified, and experience gained and problems encountered during implementation of this kind of software, especially those raised by the use of heterogeneous CASE toolset together with an APSE, are described. The experience is mainly based on developing communications and low level services software for the Ariane 5 onboard computer. The software was designed using the HOOD version 2.1 methodology and implemented in Ada and assembler. A large discrepancy must be seen presently between new development concepts and their applicability in real projects. ESA

The Hierarchical Object Oriented Design (HOOD) method and Ada are both widely used for large embedded real time software. This design method is oriented toward Ada programming. It uses the Ada tasking to map the dynamical properties of objects. Some particular critical real time requirements may today be hardly compatible with the implementation of Ada tasking. A real time silicon executive RTO (Real Time Operation) providing real time services that can be called from the software was developed. The capability of using this microchip early in the HOOD design phase while keeping the high level of abstraction of the HOOD real time features is addressed. The RTO silicon executive is seen as an alternative to the Ada implementation of the HOOD. The use of HOOD with RTO to provide an efficient implementation of cyclic tasks is examined. The HOOD/RTO connection is seen as a step leading to validation of the use of HOOD with IMAGES (Integrated Modular Avionics General Executive Software). ESA

With the increasing success of Ada in aerospace systems, attention focused recently on software reuse: reusing software components can imply substantial costs savings, sometimes up to 90%. Software components tend to become safer as they are reused, thus implying that a system built with reusable components is potentially more reliable than one developed from the scratch. However reusability has so far been implemented as local 'recovery' actions out of former projects, but hardly as an investment policy. The onboard data handling division of ESA initiated an activity to develop a set of reusable software modules for satellite onboard data handling. The results of this project are described. The project confirmed that using reusable software components can lead to an 80% reduction of the development effort. ESA

THE CODE-TOP (CONCURRENT SYSTEM DEVELOPMENT USING TRANSFORMATIONS OF PREDICATE-TRANSITION NETS) METHOD: EXAMPLES OF USING IT FOR SYSTEM ARCHITECTURE SPECIFICATION, SOFTWARE SPECIFICATION, AND CODE GENERATION **c61**
Patrick deBondeli *In its* Real-Time Embedded Processing for Space Applications Apr. 1993 p 409-427 (For primary document see N94-26713

07-60)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, Rue Nicolas-Vauquelin, 31100 Toulouse, France)

The CODE-TOP method for specifying concurrent systems modeled as asynchronous processes cooperating through the use of common synchronization/communication objects is presented. CODE-TOP can be regarded as an extension of the 'transformational approach' to software development for concurrent systems. CODE-TOP relies basically on three techniques: data abstraction or object oriented programming; formal specifications; and transformational programming. Examples of CODE-TOP are given, and the case of the ABSTRACT BUS COMMMUNICATION abstract data type, a nontrivial real life component, is used to illustrate CODE-TOP specification techniques and to give hints on the CODE-TOP Ada83 code generation technique. SIGNAL, an example of synchronous languages, and SynDEx (Synchronous Distributed Executive), which is designed to meet needs of multiprocessor executive optimization and generation, are presented. SynDEx is a graphical interactive development environment, offering: interface with SIGNAL for specification and verification of the application algorithm for achieving program reliability; specification and dimensioning of the multiprocessor machine in view of hardware optimization; optimized placement-arranging of the application algorithm on the multiprocessor with performance evaluation and visualization; and generation of the distributed executive for real time execution, relieving the user, at maximum, of heavy tasks of low level programming. The achievement of a high degree of efficiency is one of the most critical aspect in the overall economy of spacecraft design. Emerging technologies however provide the means to significantly increase the achievable efficiency in the utilization of processing and communication resources. These emerging technologies are centered around the concept of packet based services for the end to end communications on board and with ground, and the concept of deadline monotonic analysis for the scheduling of onboard software activities. Systems based upon such concepts operate according to a virtually asynchronous processing paradigm, as opposed to current systems which mostly operate in a rigidly synchronous fashion. The design of such new 'asynchronous' systems however, presents a higher number of free variable parameters and interdependencies among system components. The net result is thus an increased overall complexity. Mastering such complexity, and offering the means to tailor the system around specific application requirements is thus the key issue in the effective exploitation of this new system technology. Advanced engineering tools are needed for this purpose. A simulation based approach is discussed. ESA

DESIGN AND EVALUATION OF FAULT TOLERANCE IN OPTO-ELECTRONIC COMPUTING Semiannual Report

Ting-Ting Y. Lin 3 Dec. 1993 13 p
(Contract N00014-93-1-0698)
(AD-A274281) Avail: CASI HC A03/MF A01

The first area of research is Data-Flow Clustering. In synchronous circuits (described in terms of registers and combinational nodes), it is known that the feedback loops are dominant in determining the achievable clock period for the circuit. More precisely, the maximum delay to register ratio over all loops in the circuit (called the iteration bound) is a lower bound on the clock period. Furthermore, if the combinational nodes are fine-grained in nature, the iteration bound very closely reflects the achievable clock period through retiming. However, because of size constraints it is often necessary to partition such a circuit into multiple modules (for example FPGA's). The second area of research is network partitioning. The classical problem of finding the Minimum-Cut in an undirected graph, given source and sink nodes, s and t was studied. The problem is reformulated as a continuous placement problem. The correspondence between the Min-Cut problem and the placement problem which is then solved iteratively using gradient methods is shown. In addition, this method has good potential for efficient parallel implementation. Experimental data on the effectiveness of our approach is provided. DTIC

VIRTUAL MEMORY MANAGEMENT AND VIRTUAL BUS OVERLOADING ON MULTIPLE CHANNEL ARCHITECTURES M.S. Thesis

John N. Armitstead Dec. 1993 73 p
(AD-A274127; AFIT/GCS/Eng/93D-1) Avail: CASI HC A04/MF A01

Today's computational environment requires the processing capabilities available only through parallel architectures. The bottleneck that limits the potential of parallel processing is communication between processors, memories, and other hardware devices. A proposed multiple channel architecture (MCA) utilizes tunable semiconductor lasers and fiber optic cables that serve as the communication medium between processor, memory, and I/O nodes. A memory management unit (MMU) was completely described and implemented in a multiprocessor simulator. A permutation-based interleaving (PBI) scheme was utilized to reduce the chance of memory access collisions. Virtual bus utilization, number of collisions, and message traffic patterns were studied under various amounts of overloading. Results show that it is possible to maintain processor efficiency while reducing demand for channel availability. DTIC

PROCEEDINGS OF THE THIRD WORKSHOP COMPUTERSYSTEMS: RESEARCH FORUM ON DESIGN, REALIZATION AND USE OF COMPUTERSYSTEMS

Willem Jan Withagen, ed. 1991 72 p Workshop held in Eindhoven, Netherlands, 15 May 1991
(ISBN-90-6144-995-2; ETN-94-95284) Avail: CASI HC A04/MF A01

A language for the description and analysis of digital systems at a behavioral and structural level of abstraction, named DALIA, is presented. A parallel object oriented computer system, named POOMA, and a parallel object oriented language to express programs for execution on this are designed and implemented. A model to analyze the inherent parallelism of a simulation, and a survey of existing strategies to perform simulation in parallel are presented. A model for calculating the required amount of redundancy and the necessary degree of partitioning of the circuit to achieve a maximum efficiency is proposed. A compile time technique for determining if a set of procedures within a parallel program can be executed sequentially without causing deadlock is described. For individual titles, see N94-27192 through N94-27196.

DALIA: A LANGUAGE FOR THE DESCRIPTION AND ANALYSIS OF DIGITAL SYSTEMS c61

Henk vanderWeij *In its* Proceedings of the 3rd Workshop Computersystems: Research Forum on Design, Realization and Use of Computersystems 1991 p 1-16 (For primary document see N94-27191 07-60)
Avail: CASI HC A03/MF A01

DALIA is a formal language for the description and analysis of digital systems at a behavioral as well as a structural level of abstraction. It is based on a functional style of programming, extended with annotations for indicating system structure, accessability, and signal flow direction. Program transformation rules are defined for rewriting DALIA descriptions to behaviorally equivalent alternatives. The language is developed to be used as a formal basis for automated system design, adopting the following philosophy: the requirements for the system to be designed are formalized in the DALIA notation. The formal specification is stepwise transformed to a structural description of the system realization. Formal descriptions and transformations, allowing a correctness by construction methodology, are considered. ESA

PARALLEL COMPUTERS FOR ADVANCED INFORMATION PROCESSING Abstract Only **c62**
E. Odijk *In* Technische Univ., Proceedings of the 3rd Workshop Computersystems: Research Forum on Design, Realization and Use of Computersystems 1991 p 17 (For primary document see N94-27191 07-60)
Avail: CASI HC A01/MF A01

A parallel object oriented computer system, POOMA, and a parallel object oriented language to express programs for execution on this system were designed and implemented. A survey of the systems concepts, the rationale of a number of the design choices, and the lessons learned during the design are included. POOMA is a distributed memory, scalable, computer that consists of self contained computers, each with their own central processing unit, main memory and a communication unit. These computers communicate via a sparsely connected, packet switching, topology of bidirectional communication links that are serviced by the communication unit. The architecture designed to meet the requirements of the parallel object oriented language, and the match of the conceptual and operational models are described. ESA

PARALLEL DISCRETE EVENT SIMULATION **c62**
Benno Overeinder, Bob Hertzberger, and Peter Sloot *In* Technische Univ., Proceedings of the 3rd Workshop Computersystems: Research Forum on Design, Realization and Use of Computersystems 1991 p 19-30 (For primary document see N94-27191 07-60)
Avail: CASI HC A03/MF A01

A model to analyze the inherent parallelism of a simulation, together with a survey of existing strategies to perform the simulation in parallel are presented. Extensions to this model are discussed, resulting in reliable evaluation of the effectiveness of these strategies. In simulating applications for execution on specific computing systems, the simulation performance figures must be known in a short period of time. One basic approach to the problem of reducing the required simulation time is the exploitation of parallelism. Due to the distributed generation of events causality errors can occur; as a result, the sequence in which to process the events is essentially indeterminated. An introduction to discrete event simulation is given. A parallel view to the sequential simulation is proposed. Methods for parallel simulation are described and their effectiveness is considered. These methods are evaluated and some suggestions for further research are presented. ESA

A PARTITIONING AND REDUNDANCY MODEL FOR WAFER-SCALE INTEGRATED CIRCUITS
Martin F. Beusekamp *In* Technische Univ., Proceedings of the 3rd Workshop Computersystems: Research Forum on Design, Realization and Use of Computersystems 1991 p 31-49 (For primary document see N94-27191 07-60)
Avail: CASI HC A03/MF A01

A general, architecture independent model to calculate the required amount of redundancy and the necessary degree of partitioning of the circuit to achieve a maximum efficiency are presented. In wafer scale integration, a certain amount of redundancy is required to achieve an acceptable yield. It is shown that in practical cases, the efficiency curve around the maximum is relatively flat. The model presents the optimal degree of partitioning, rate of redundancy, total area, yield and efficiency for any desired circuit. It is shown that, for every technological environment, there exists a critical circuit size, below which the implementation of partitioning and redundancy is undesirable. Above this critical circuit size, partitioning into rather small cells leads to optimal efficiency, in spite of the fact that small cells require a considerable overhead of reconfiguration wiring and switches. It was shown that the model can be adapted to any specific architecture by adjusting parameters and limiting possible solutions to restricted, architecture dependent values. By a mathematical substitution, the model can be made completely analytic. ESA

EFFICIENT IMPLEMENTATION OF HIGH-LEVEL PARALLEL SYMBOLIC LANGUAGES **c61**
Mark Korsloot (Oregon Univ., Portland.) and E. Tick *In* Technische Univ., Proceedings of the 3rd Workshop Computersystems: Research Forum on Design, Realization and Use of Computersystems 1991 p 51-69 (For primary document see N94-27191 07-60)
Avail: CASI HC A03/MF A01

A compile time technique for determining if a set of procedures within a parallel program can be executed sequentially without causing deadlock is presented. The analysis and methods are described for committed choice parallel logic programming languages. The concepts are general enough for any concurrent languages with fine grain communicating processes. Methods for ensuring that sequential evaluation of a program module cannot result in producer-consumer suspension within the module itself, resulting in deadlock, are derived. The advantages of sequentializing fine grain languages include the use of 'traditional' compiler optimizations, and continuation stacking procedure invocation. ESA

BINARY SNAPSHOTS
Jaap-Henk Hoepman and John T. Tromp Mar. 1993 11 p
(ISSN 0169-118X)
(CWI-CS-R9319; ETN-94-95432) Copyright Avail: CASI HC A03/MF A01

The shared memory wait-free 'atomic snapshot' object in its simplest form where each cell contains a single bit is considered. The 'universality' of this binary snapshot object is demonstrated by presenting an efficent linear time implementation of the general multibit atomic snapshot object using an atomic binary snapshot object as a primitive. Thus, the search for an efficient (subquadratic or linear time) wait-free atomic snapshot implementation may be restricted to the binary case. ESA

(NASA-TM-109708; NAS 1.15:109708; SSP-30540-Rev-A) Avail: CASI HC A12/MF A03

The Human Computer Interface Guide, SSP 30540, is a reference document for the information systems within the Space Station Freedom Program (SSFP). The Human Computer Interface Guide (HCIG) provides guidelines for the design of computer software that affects human performance, specifically, the human-computer interface. This document contains an introduction and subparagraphs on SSFP computer systems, users, and tasks; guidelines for interactions between users and the SSFP computer systems; human factors evaluation and testing of the user interface system; and example specifications. The contents of this document are intended to be consistent with the tasks and products to be prepared by NASA Work Package Centers and SSFP participants as defined in SSP 30000, Space Station Program Definition and Requirements Document. The Human Computer Interface Guide shall be implemented on all new SSFP contractual and internal activities and shall be included in any existing contracts through contract changes. This document is under the control of the Space Station Control Board, and any changes or revisions will be approved by the deputy director. Derived from text

The goal of this task was to investigate how formal methods could be incorporated into a software engineering process for flight-control systems under DO-178B and to demonstrate that process by developing a formal specification for NASA's Guidance and Controls Software (GCS) Experiment. GCS is software to control the descent of a spacecraft onto a planet's surface. The GCS example is simplified from a real example spacecraft, but exhibits the characteristics of realistic spacecraft control software. The formal specification is written in Larch. Author

N94-25588 RTware, Inc., Durham, NC.
MODULE INTERCONNECTION FRAMEWORKS FOR A REAL-TIME SPREADSHEET Final Report
Richard Clarke 19 Oct. 1993 59 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A273853) Avail: CASI HC A04

Phase 1 research into a modular real-time spreadsheet has yielded a significant result: a spreadsheet can be used to completely simulate, completely prototype, and completely implement distributed control systems. A usable implementation of such a system will be done in Phase 2. Commercialization will begin in the middle of Phase 2, with the release of a set of distributed processing options for RTware's ControlCalc product. Demonstration applications in Naval applications will be done in cooperation with RTware's existing Naval customers. A real-time spreadsheet will be used to build nodes in a software module interconnection framework (MIF), allowing interactive, on-line construction of distributed control applications. Due to major advances in spreadsheet software technology already implemented in ControlCalc, the commercially-available spreadsheet to be used, the system will allow prototyping, simulation, top down design, and implementation down to the final, lowest-level runtime machine code. The MIF is Polylith, which provides a remote function calling and message-passing abstraction that can be used by any language, including a spreadsheet. A graphical diagram editor will provide visualization of and navigation through the module framework. The major spreadsheet advances are as follows: on-the-fly expression compilation, multi-threading evaluation, and multi-tasking text or graphical user interface sessions. Important supporting capabilities include the following: in-line I/O functions for direct access to analog or digital hardware and file or network protocols, strong typing, direct mapping to the output of graphical user interface editors, and extensibility through calling user-supplied functions in other languages directly from compiled spreadsheet expressions. The Pasadena Workshop on System Software and Tools for High Performance Computing Environments was held at the Jet Propulsion Laboratory from 14-16 Apr. 1992. The workshop was sponsored by a number of Federal agencies committed to the advancement of high performance computing (HPC) both as a means to advance their respective missions and as a national resource to enhance American productivity and competitiveness. Over a hundred experts in related fields from industry, academia, and government were invited to participate in this effort to assess the current status of software technology in support of HPC systems. The overall objectives of the workshop were to understand the requirements and current limitations of HPC software technology and to contribute to a basis for establishing new directions in research and development for software technology in HPC environments. This report includes reports written by the participants of the workshop's seven working groups. Materials presented at the workshop are reproduced in appendices. Additional chapters summarize the findings and analyze their implications for future directions in HPC software technology development. DOE

NAVAL INTERACTIVE DATA ANALYSIS SYSTEM (NIDAS), SOFTWARE USER'S MANUAL Technical Note
Dharmesh Krishnamagaru, Leana Dusang, Vishnumohan Das, and M. S. Foster, ed. 29 Nov. 1993 53 p
(Contract NAS13-564)
(NASA-CR-195179; NAS 1.26:195179; AD-A273847; CAST-TN-03-94)
Avail: CASI HC A04/MF A01

NIDAS provides interactive blending and overlay capabilities for a broad range of environmental data types and formats. The product output of NIDAS is a three-dimensional gridded field of temperature and salinity constructed from (1) data derived by the user internally within NIDAS by synthesis, and (2) data obtained from external numerical models, observations, and climatological databases. NIDAS operate using numerous oceanographic data categories stored in an installed version of the Naval Environmental Operational Nowcast System (NEONS), a relational database management system (rdbms) which employs the EXPRESS proprietary rbdms engine. Data management, configuration, and control functions for the supporting rdbms are performed externally. NIDAS retrieves and stores data to/from the rdbms but exercises no direct internal control over the rbdms or its configuration. Data is also ingested into the rbdms, for use by NIDAS, by external data acquisition processes. DTIC

HIGH RESOLUTION FOURIER TRANSFORM ABSORPTION SPECTRUM OF 79Br2 B3 Pi(Ou+) X1 SIGMA g+ M.S. Thesis
Robert E. Franklin Dec. 1993 78 p
(AD-A273864; AFIT/GAP/ENP/93D-02) Avail: CASI HC A05/MF A01

High Resolution Fourier Transform Spectroscopy was conducted for the B(sub 3)Pi(O(sub u)(+)) yields X(sub 1)Sigma(sub g)(+) system of (Br2)-79.

A total of 64 vibrational levels, including v'' = 0-3 and v' = 10-33, were observed and assigned. Rotational levels as high as J=76 were observed. A global fitting routine was developed to fit the rotational spectra to the Dunham Expansion. Using B(sub v) and D(sub v) for both the X and B state, rotational transitions were calculated to within 0.02 cm(sub -1). The expansions of these terms required five coefficients for the B state and three coefficients for the X state. Attempts to fit the vibrational spectrum to an equation in terms of (v+1/2) were only accurate to within 0.03 cm(sub -1) when five molecular constants were used on the upper level and three were used on the ground state. However, direct calculation of the vibrational energy levels was able to fit all vibrational bandheads to less than 0.02 cm(sub -1). Recommendations are made for attempting a global fit over many more vibrational bands. DTIC

CALCULATION OF A 3-D POSE OF A KNOWN OBJECT IN A SINGLE PERSPECTIVE VIEW Ph.D. Thesis - Oulu Univ.
Kari Pehkonen Nov. 1992 105 p Sponsored by Technology Development Center of Finland
(ISSN 1235-0621)
(VTT-PUBS-122; ISBN-951-38-4240-1; ETN-94-95235) Copyright Avail: CASI HC A06/MF A02

An algorithm for determining the three dimensional (3D) pose of a known object in a single two dimensional view is described. The pose calculation algorithm consists of four main stages: pose candidate generation, candidate verification, optimization, and reliability analysis. Pose candidates are generated by matching model and image triangles. The three point perspective pose estimation problem is solved numerically. Pose candidates are verified by matching model and image features. The first accepted candidate is optimized. Three optimization methods are considered: Newton-Raphson, simulated annealing, and robust M estimate using Lorenzian distribution. The reliability estimates are based on covariance analysis. Uncertainties due to both model and image noise are taken into account. A structure optimization method to reduce modeling noise is presented. The speed and accuracy of the algorithm were estimated. SHIVA: A UNIX-BASED, MENU-DRIVEN, COLOR IMAGE PROCESSING SOFTWARE PACKAGE Final Report, May 1992 - May 1993
Michael J. McQuaid, Gary C. Bliesener, Eric Prather, and Avi Birk Oct. 1993 26 p
(AD-A274071; ARL-TR-294) Avail: CASI HC A03/MF A01

A user-friendly 'point and click' program named SHIVA has been developed to facilitate processing and analysis of digital color images. SHIVA, an acronym for simple heuristic interactive visualization and animation, provides access to a full range of image processing and analysis tools via a graphical interface and with minimal instruction. This technical report describes the main hierarchy and functionality of SHIVA. The program has been used to process color images of burning monopropellant sprays illuminated by a copper vapor laser. Though SHIVA was developed to support the spray research effort, it should be useful in a wide range of U.S. Army Research Laboratory (ARL) research applications where color image processing and analysis is employed. VULNERABILITY ASSESSMENT USING A FUZZY LOGIC BASED METHOD M.S. Thesis
Richard W. Fleming Dec. 1993 102 p
(AD-A274075; AFIT/GCE/Eng/93D-03) Avail: CASI HC A06/MF A02

This thesis demonstrates the feasibility of using qualitative analysis methods to evaluate computer security vulnerabilities. Although many risk analysis systems exist, few provide for the adequate analysis of identified vulnerabilities. While the main focus of this thesis is to evaluate computer security vulnerabilities, the methods involved have application in other areas requiring evaluation using qualitative methods. It is proposed, and demonstrated by this thesis, that the use of qualitative analysis using linguistic variables to describe the impact of computer security vulnerabilities is not only feasible, but intrinsically easier to understand and use than quantitative methods. PROPOSED OBJECT ORIENTED PROGRAMMING (OOP) ENHANCEMENTS TO THE VERY HIGH SPEED INTEGRATED CIRCUITS (VHSIC) HARDWARE DESCRIPTION LANGUAGE (VHDL) Final Report, 4 May 1992 - 4 Aug. 1993
Michael T. Mills Aug. 1993 22 p
(AD-A274004; WL-TR-93-5025) Avail: CASI HC A03/MF A01

This report describes an integrated set of Object Oriented Programming (OOP) enhancements proposed for a future revision of the VHSIC Hardware Description Language (VHDL). It offers inheritance with extension for VHDL record, array and private type declarations, plus multiple inheritance with extension for entities and corresponding architecture bodies, and a class wide dispatching capability for all tagged types and tagged entities. If these three enhancements are accepted by the IEEE, VHDL based design automation tools can possess new abstract design capabilities for developing and enhancing electronic hardware. Current software languages with OOP capability increase productivity and reuse by enabling the design process to inherit and extend existing data structures and functionality. By selectively inheriting what already exists, the designer minimizes duplication. Functional capabilities and characteristics can be inherited and extended without affecting existing portions of a design. DTIC

The optimal constrained linear inverse method (OCLIM) is a new algorithm for magnetic source imaging that approximates an unknown continuous current distribution as a weighted sum of current sources in fixed positions, uses prior information about the expected source power density and measurement noise, and can be efficiently computed. It achieves the minimum possible mean square reconstruction error for any linear estimator and provides statistical confidence limits on the reconstructed source amplitudes. The minimum-norm least squares and weighted pseudoinverse methods are included as special cases. However, OCLIM can produce reconstruction artifacts if the true current distribution is inconsistent with the assumed priors. DOE

IGES 4.0 TO LCAD TRANSLATOR FOR CSG MODELS
John R. Anderson, Earl P. Weaver, and Susanne L. Muuss Dec. 1993 24 p
(DA Proj. 1L1-62618-AH-80)
(AD-A274013; ARL-TR-315) Avail: CASI HC A03/MF A01

The subject of importing IGES 4.0 format (Initial Graphics Exchange Specification Version 4.0) computer-aided design (CAD) constructive solid geometry (CSG) models into the former Ballistic Research Laboratory's Computer-Aided Design (BRLCAD) package is discussed and the results of a software development project to implement an IGES-to-BRLCAD translator that conforms to the ASME Y14.26M-1989 Standard are described. A brief description of the IGES philosophy and specification, the relationship between IGES and the American National Standards Institute (ANSI) standard on the exchange of product definition data, limitations of the current specifications/standards and BRLCAD, suggested solutions for overcoming those limitations, and recommendations for future work are also included. A LOGARITHMIC BARRIER CUTTING PLANE METHOD FOR CONVEX PROGRAMMING
D. denHertog, C. Roos, J. Kaliski, and T. Terlaky 1993 29 p Sponsored by Shell
(Contract OTKA-2116) (ISSN 0922-5641)
(Rept-93-43; ETN-94-95398) Copyright Avail: CASI HC A03/MF A01

A logarithmic barrier cutting plane algorithm for convex programming is presented. Most cutting plane methods solve a linear approximation of the problem and generate an additional cut to remove the linear program's optimal point. Other methods calculate a center of the linear approximation and adjust the level of the objective or separate the current center from the feasible set. A method which does not solve the linear relaxations till optimality, but stays in the interior of the feasible set, is described. The iterates follow the central path of a linear relaxation until the current iterate either leaves the feasible set or is too close to the boundary. When this occurs, a new cut is generated and the algorithm iterates. The tools developed to analyze the effect of adding and deleting contraints in long step logarithmic barrier methods for linear programming are used. Implementation issues and computational results are presented. The test problems come from the classes of convex geometric and semi infinite programming problems. ESA

(Contract OTKA-2116) (ISSN 0922-5641)
(Rept-93-44; ETN-94-95399) Copyright Avail: CASI HC A03

A unified treatment of Elzinga and Moore's and Goffin and Vial's central cutting plane methods is presented. It is shown that Goffin and Vial's method enjoys the same convergence properties as Elzinga and Moore's method. Cutting plane methods, like that of Kelley and Cheney and Goldstein, solve a linear approximation (localization) of the problem and then generate an additional cut to remove the linear program's optimal point. Other methods, like the 'central cutting' plane methods, calculate a center of the linear approximation and then adjust the level of the objective or separate the current center from the feasible set. An algorithm to compute an integral point in a polytope is presented. It is based on an integer labeling and a triangulation of R(sup n). The idea is as follows. The algorithm subdivides R(sup n) into n + 1 cones and assigns to each point in R(sup n) an integer according to the cones and the polytope. It generates a sequence of adjacent simplices of varying dimension along each of n + 1 rays. The sequence terminates within a finite number of iterations at either a socalled complete n dimensional simplex or a so-called 0 complete n dimensional simplex that yields an integral point in the polytope. Numerical tests show the efficiency of the algorithm. ESA

ObjectSim: A REUSABLE OBJECT ORIENTED DIS VISUAL SIMULATION M.S. Thesis
Mark I. Snyder Dec. 1993 106 p
(AD-A274030; AFIT/GCS/ENG/93D-20) Avail: CASI HC A06/MF A02

This research designed and implemented a reusable distributed interactive simulation (DIS) visual simulation architecture for Silicon Graphics platforms. The goal was to research software architecture technologies and to create a design and implementation using these ideas. The architecture was designed using object oriented techniques to provide the ability to customize it via inheritance extension. The resulting design was implemented using C++ and applied to several DIS visual simulation projects in the Graphics Lab at AFIT. The architecture, named ObjectSim, was successful in its goal of providing a reusable core for the DIS visual simulation projects in the Graphics Lab at AFIT. It provides simulation developers reusable capabilities in the areas of rendering, data display, device interfacing, and DIS network interfacing. The projects designed and implemented with ObjectSim exceeded their research goals. Data on reuse effectiveness and several different performance areas was collected. DTIC

DESIGN OF DYNAMICALLY RECONFIGURABLE REAL-TIME SOFTWARE USING PORT-BASED OBJECTS
David B. Stewart, Richard A. Volpe, and Pradeep K. Khosla 1 Jul. 1993 28 p
(Contract NAG1-1075; DAAA21-89-C-0001)
(NASA-CR-195178; NAS 1.26:195178; AD-A273717; CMU-RI-TR-93-11) Avail: CASI HC A03/MF A01

The current development of applications for sensor-based robotic and automation (R&A) systems is typically a 'one-of-a-kind' process, where most software is developed from scratch, even though much of the code is similar to code written for other applications. The cost of these systems can be drastically reduced and the capability of these systems improved by providing a suitable software framework for all R&A systems. A software framework, based on the notion of dynamically reconfigurable software for sensor-based control systems was described. Tools to support the implementation of this framework were built into the Chimera 3.0 Real-Time Operating System. The framework provides for the systematic development and predictable execution of flexible R&A applications while maintaining the ability to reuse code from previous applications. It combines object-oriented design of software with port-automaton design of digital control systems. A control module is an instance of a class of port-based objects. DTIC

DOMAIN ANALYSIS AND MODELING OF A MODEL-BASED SOFTWARE EXECUTIVE M.S. Thesis
Robert L. Welgan Dec. 1993 160 p
(AD-A274087; AFIT/GCS/Eng/93D-25) Avail: CASI HC A08/MF A02

This research adapted the domain analysis techniques of Prieto-Diaz and Tracz to specify a domain analysis process which was used to conduct domain analysis over the domain of software executives. This analysis created a set of informal and formal domain model artifacts. The domain model artifacts were instantiated into two application executive subsystems. These executive subsystems operated in Architect, a domain-oriented application composition system based on the object connection update (OCU) model. This research demonstrated and evaluated execution of the instantiated executive domain model in a series of event-driven and time-driven applications. As a consequence of developing the application executive for Architect, this research proposes additions to the OCU model. DTIC

GRAPHICAL PROGRAMMING AT SANDIA NATIONAL LABORATORIES
Michael J. McDonald, Robert D. Palmquist, and Lisa Desjarlais (New Mexico Univ., Albuquerque.) Sep. 1993 4 p Presented at the 7th Deneb Robotics User Group Meeting, Troy, MI, 12-15 Oct. 1993
(Contract DE-AC04-94AL-85000)
(DE94-003803; SAND-93-2742C; CONF-9310216-4) Avail: CASI HC A01/MF A01

Sandia has developed an advanced operational control system approach, called Graphical Programming, to design, program, and operate robotic systems. The Graphical Programming approach produces robot systems that are faster to develop and use, safer in operation, and cheaper overall than alternative teleoperation or autonomous robot control systems. Graphical Programming also provides an efficient and easy-to-use interface to traditional robot systems for use in setup and programming tasks. This paper provides an overview of the Graphical Programming approach and lists key features of Graphical Programming systems. Graphical Programming uses 3-D visualization and simulation software with intuitive operator interfaces for the programming and control of complex robotic systems. Graphical Programming Supervisor software modules allow an operator to command and simulate complex tasks in a graphic preview mode and, when acceptable, command the actual robots and monitor their motions with the graphic system. Graphical Programming Supervisors maintain registration with the real world and allow the robot to perform tasks that cannot be accurately represented with models alone by using a combination of model and sensor-based control. RESEARCH ON PRIMAL-DUAL INTERIOR POINT ALGORITHMS FOR MATHEMATICAL PROGRAMMING
Yin Zhang Sep. 1993 7 p
(Contract DE-FG05-91ER-25100)
(DE94-003982; DOE/ER-25100/2) Avail: CASI HC A02/MF A01

Today interior-point methods of choice for general linear programming are primal-dual infeasible interior-point algorithms. There is a big gap between theoretical algorithms and practical algorithms. Major goals of the project were to narrow the gaps between theory and practice of primal-dual interior-point methods. The PI (principal investigator) played a leading role in joint work with Richard Tapia on constructing the first superlinear and polynomial primal-dual algorithm. The PI's recent work on infeasible interior-point methods established the first polynomial result for today's interior-point methods of device. More recently, the PI established polynomial complexities for Mehrotra-type predictor-corrector methods which have been widely regarded today as the most practically efficient methods. This work has laid a solid theoretical foundation for these methods. DOE

THE USE OF ASN.1 AND XDR FOR DATA REPRESENTATION IN REAL-TIME DISTRIBUTED SYSTEMS Final Report
B. C. Myers and Gary Chastek Oct. 1993 70 p
(Contract F19628-90-C-0003)
(AD-A273769; CMU/SEI-93-TR-10; ESC-TR-93-187) Avail: CASI HC A04/MF A01

This report provides an overview of two standards that are used for data specification and representation in distributed systems. The standards considered are the Abstract Syntax Notation One (ASN.1) and the external data representation (XDR). Standards for data representation are appropriate for the development of real-time distributed systems, particularly loosely coupled, heterogeneous systems. The report presents an example of the use of each standard. Several performance metrics are also introduced that are suitable for comparing the space and time costs of using the different standards. Several issues are discussed that are appropriate to a system designer. An Ada implementation of ASN.1 encode and decode routines for floating point types is included in an appendix. DTIC

IRMA: A PROGRAM FOR THREE-DIMENSIONAL COLOR DISPLAY OF DATA
M. F. Tautz 30 May 1993 45 p
(Contract F19628-89-C-0068)
(AD-A273811; PL-TR-93-2116; SR-13) Avail: CASI HC A03/MF A01

This report describes the input, output, and interactive capabilities of the IRMA plotting program. Actual FORTRAN or C coding is not given. The IRMA program was designed for displaying data from spacecraft charging and contamination codes in three dimensions and in color. The user interface features interactive control of viewing position and perspective by keyboard and mouse input. Text ports are available so that figure captions can be typed directly to the screen. The current graphics state can be saved in a parameter file for later restoration. The many data visualization options include drawing complex polygon objects, displaying particle trajectories, creating contour level surfaces, and building random dot plots to represent number density. Column density images can be obtained by integrating along an arbitrary line of sight. Image files can be written out to create a set of frames depicting the time sequence of events. DTIC

FAST VERTEX SEARCH (IN PLANE)
A. A. Glazov, I. V. Kisel, E. V. Konotopskaja, and S. M. Korenchenko 1991 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616655; JINR-E-10-91-374) Avail: CASI HC A03 (US Sales Only)

The fast vertex search method is suggested for plane geometry. The search for the vertex reduces to comparison of values of the functional in a few easy-to-find points. This method also provides a simple procedure for 'pulling' the vertex to the target. These properties are extremely important for processing the data, obtained in experiments on the search for rare and forbidden decays, when registered events are accidental in most cases. If necessary, the vertex found by this method may be used as an initial approximation for the least square method, which is important for experiments with a big target. The method was examined on three-track events, obtained in the experiment of the search for the forbidden decay mu yields 3e on the ARES facility. DOE

OBJECT INTERACTION IN A PARALLEL OBJECT-ORIENTED DISCRETE-EVENT SIMULATION M.S. Thesis
Walter G. Trachsel 15 Dec. 1993 131 p
(AD-A274084; AFIT/GCS/Eng/93D-22) Avail: CASI HC A07/MF A02

This thesis investigates object interaction issues involved in developing an object-oriented parallel discrete-event simulation and develops a simulation model that provides object interaction capabilities. The research covers issues in object representation, object interaction, object management, discrete-event simulation, and parallel simulation. There are three primary types of objects that the research discusses. The first type is a basic simulation object, whose size and behavior is insignificant compared to the size of the simulation as a whole. The second type is an aggregate object which consists of smaller component objects that interact and affect the performance of the larger object as a whole. Finally, there are environmental objects, such as terrain and weather, whose size and impact are significant to the entire simulation environment. This research addresses issues about whether these objects can be represented the same in the simulation or whether a special case must exist for each type of object. As a result of the research, a simulation model is designed that allows interaction between simulation objects. The design goals used to develop the model were strict use of object-oriented practices, ease of simulation modification, and reuse across other applications in the same class of simulations. In this case, the class of simulations is interacting objects in a spatially partitioned discrete-event simulation. The model is then implemented using AFIT's Battlesim program, which is a parallel discrete-event simulation that has a battlefield divided into partitions and allows objects to move and interact. A REAL-TIME CONVOLUTION ALGORITHM AND ARCHITECTURE WITH APPLICATIONS IN SAR PROCESSING
L. H. Bierens Oct. 1993 28 p
(AD-A273817; FEL-93-B113; TDCK-TD93-2788) Avail: CASI HC A03/MF A01

An algorithm that maps a large one-dimensional linear convolution problem onto a small two-dimensional linear convolution problem is proposed. It was shown that this property can be derived from a signal flow representation of a sectioned convolution. The introduction of short length FFT processor elements into the signal flow graph results in a structure that can be efficiently implemented in a dedicated hardware architecture. Although the performance of the architecture is not optimal in terms of computational complexity, the performance in terms of data rate, input data sequence lengths and amount of required hardware is high. The architecture design is illustrated with a configuration suitable for real-time on-board airborne synthetic aperture radar (SAR) processing for the Phased Array Universal Sar (PHARUS), which is currently under development at TNO-FEL. DEVELOPING A SOPHISTICATED USER INTERFACE TO SUPPORT DOMAIN-ORIENTED APPLICATION COMPOSITION AND GENERATION SYSTEMS M.S. Thesis
Jay A. Cossentine 15 Dec. 1993 128 p
(AD-A274080; AFIT/GCS/Eng/93D-04) Avail: CASI HC A07/MF A02

This research refined the visual presentation and usability of a previously developed visual interface for a domain-oriented application composition and generation system. The refined visual interface incorporated domain-specific bit-mapped graphics and sophisticated user interface design concepts to reduce user workload. User workload was reduced by the following methods: object layout, window design, and color utilization techniques; by combining repetitive procedures into single commands; and reusing, rather than recreating, composition information throughout the application composition process. The Software Refinery environment, including its graphical interface tool INTERVISTA, was used to develop techniques for visualizing and manipulating objects contained in a formal object base. INTERVISTA was supplemented with graphical routines provided by Common Windows, a Lisp-based graphical environment that serves as the foundation for INTERVISTA. The interface was formally validated with a well-understood application domain, digital logic-circuits, and users of the interface were polled to ascertain the subjective usability of the interface. A comparative analysis of the application composition process with the previous visual interface was conducted to quantify the workload reduction realized by the new interface. Workload was measured as the number of user interactions (mouse or keyboard) required to compose an application. On average, application composition effort was reduced 44.0% for the test cases. DTIC

DEVELOPING A GRAPHICAL USER INTERFACE TO SUPPORT A REAL-TIME DIGITAL SIGNAL PROCESSING SYSTEM M.S. Thesis
Jeffrey C. Miller Dec. 1993 163 p
(AD-A274032; AFIT/GCS/ENG/93D-16) Avail: CASI HC A08/MF A02

A graphical software user interface for a VME bus-based real-time digital signal processing system was designed. User requirements were defined and the Rumbaugh object-oriented analysis and design technique was applied to analyze the requirements and produce an object-oriented design. The software design includes a graphical, mouse-, and keyboard-driven user interface; specialized hardware driver modules; and operating system interfaces. An implementation plan was also developed to map the design into the C programming language using existing system code, automatically generated code, and newly written code. Based on the implementation plan, a limited software system prototype was successfully developed and demonstrated. The system can be used to analyze signals previously recorded on disk or sampled in real time. Analyzed signals can be displayed either as a set of discrete samples or as a graph in either the time or frequency domains. The system includes real-time sampling hardware, specialized DSP hardware, general-purpose computing hardware based on the Motorola 68030 microprocessor, mass storage media, and a high-resolution graphical display. SOFTWARE REDESIGN FOR USABILITY: A CASE STUDY
J. A. Sanchez and M. D. Adickes Oct. 1993 4 p Presented at the Human Factors and Ergonomics Society Meeting, Seattle, WA, 11-15 Oct. 1993
(Contract DE-AC06-76RL-01830)
(DE94-003704; PNL-SA-23116; CONF-9310100-4) Avail: CASI HC A01/MF A01

In an ideal software development environment, the use of a programming language such as C allows developers the ability to create an application that matches the requirements and needs of a client. Recent breakthroughs and advances in software design and graphical user interfaces, however, make it much more difficult to justify, from either a cost or time perspective, developing an application completely from scratch using such a language. By using commercial development packages (prototyping development tools), developers are freed from many of the time consuming tasks that would ordinarily be involved in creating an application, and are able instead to concentrate on what should be the two most important areas of an application, what it should do and how it should look. This poster session illustrates the significant benefits that can be achieved by creating an application using a commercial data base package with a graphical user interface developer along with a multidisciplinary team of developers. The primary emphasis of the display focuses on the ability of the developer to incorporate human factors considerations to ensure that the program is both easy to use and easy to change, given additional client inputs and requests. IMAGE SEGMENTATION BY A COMBINATION OF EDGE DETECTION AND REGION GROWING Thesis [BEELDSEGMENTATIE DOOR EEN COMBINATIE VAN RANDDETECTIE EN REGION GROWING]
R. J. Wicherson Jul. 1992 85 p In DUTCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95032) Avail: CASI HC A05

The development of a two stage image segmentation method is reported. In stage one, the edge based region growing stage, adjacent pixels with gray values which have a nonsignificant difference are merged into one segment through the use of a predictor. In this stage, special attention is payed to the localization of the segment borders. In stage two, the region growing stage, all the incorrect placed segment borders are eliminated. If the difference between the medians of the pixels of two segments is non significant, these segments are merged. Segments which have a nonsignificant size and segments existing of mixed pixels are removed by merging these with the best fitting adjacent segment. All the decision rules are based on statistical tests. The developed method was programmed and tested on three artificial and three real images. The method results in segments with closed contours. The segmented test images show after visual assessment that the edges are located accurately. The number of detected segments corresponds to the correct number of segments. ESA

THE NATIONAL CENTER FOR ADVANCED INFORMATION COMPONENTS MANUFACTURING: PROGRAM UPDATE
J. L. Jorgensen 1993 3 p Presented at the Defense Manufacturing Conference, San Francisco, CA, 29 Nov. - 2 Dec. 1993
(Contract DE-AC04-94AL-85000)
(DE94-002647; SAND-93-2508C; CONF-9311113-1) Avail: CASI HC A01/MF A01

The National Center for Advanced Information Components Manufacturing (NCAICM) was established by congressional appropriation in the FY93 Defense Appropriation Bill. The Center, located at Sandia National Laboratories in Albuquerque, NM, is funded through the Advanced Research Projects Agency (ARPA). The technical focus of NCAICM is emissive flat panel displays and associated microelectronics, specifically targeting manufacturing issues such as materials, processes, equipment, and software tools. This Center is a new avenue of collaboration between ARPA and the Department of Energy (DOE). It will help the government meet its obligation to develop dual-use capabilities for the defense and civilian sectors of the economy and provide a new method for cooperation and collaboration between the federal government and American industry. In particular, one of NCAICM's goals is to provide industry access to the broad resource base available at three DOE Defense Programs laboratories -- Sandia National Laboratories, Los Alamos National Laboratory, and Lawrence Livermore National Laboratory. Test/analysis correlation, or structural identification, is a process of reconciling differences in the structural dynamic models constructed analytically (using the finite element (FE) method) and experimentally (from modal tests). This is a methodology for assessing the reliability of the computational model, and it is very important in building models of high integrity, which may be used as predictive tools in design. Both the analytic and experimental models evaluate the same quantities: the natural frequencies (or eigenvalues, (omega(sub i)), and the mode shapes (or eigenvectors, (var phi)). In this paper, selected frequencies are reconciled in the two models by modifying physical parameters in the FE model. A variety of parameters may be modified such as the stiffness of a joint member or the thickness of a plate. Engineering judgement is required to identify important frequencies and to characterize the uncertainty of the model design parameters. DOE

Identifying and isolating features is an important part of visualization and a crucial step for the analysis and understanding of large time-dependent data sets (either from observation or simulation). In this proposal, we address these concerns, namely the investigation and implementation of basic 2D and 3D feature based methods to enhance current visualization techniques and provide the building blocks for automatic feature recognition, tracking, and correlation. These methods incorporate ideas from scientific visualization, computer vision, image processing, and mathematical morphology. Our focus is in the area of fluid dynamics, and we show the applicability of these methods to the quantification and tracking of three-dimensional vortex and turbulence bursts. Author

An interactive editor that operates on a projection of a tree structure can offer the user many possible commands. An attempt to catalog and classify, in a rigorous way, the commands that can be offered is made. A simple tree and more complex trees are discussed. It is assumed that the reader has some familiarity with the basics of structured editors. ESA

THE ERGONOMICS OF SOFTWARE PORTING: AUTOMATICALLY CONFIGURING SOFTWARE TO THE RUNTIME ENVIRONMENT OR EVERYTHING YOU WANTED TO KNOW ABOUT YOUR C COMPILER BUT DIDN'T KNOW WHO TO ASK
Steven Pemberton Dec. 1992 23 p
(ISSN 0169-118X)
(CWI-CS-R9266; ETN-94-95418) Copyright Avail: CASI HC A03/MF A01

Techniques used in a program called 'enquire.c,' which calculates and prints out details of the target machine and the C compiler, are presented. The program can be used for interest, to see the properties of the particular target machine, and to produce the two header files 'float.h' and 'limits.h,' which give target machine values such as word length, byte order, minimum and maximum values for a range of types, etc., which need to be known when porting C programs. An additional option allows a check to see if the compiler reads the header files correctly: many read the minimum floating point number back as zero, or get the last few digits of floating point numbers wrong. DEVELOPMENT AND ANALYSIS OF SECURE EMBEDDED SOFTWARE [TURVALLISTEN SULAUTETTUJEN OHJELMISTOJEN KEHITTAEMINEN JA ANALYSOINTI]
Jukka Korhonen and Jarmo Kalaoja Nov. 1992 74 p In FINNISH
(ISSN 1235-0605)
(VTT-TIED-1430; ISBN-951-38-4324-6; ETN-94-95258) Copyright Avail: CASI HC A04/MF A01

Information on the best design methods for secure software is presented. Procedures and instruments applicable to the analysis of embedded software security were developed for the case where the software development was based on the Yourdon real time structure analysis procedure. The analysis technique chosen was that of fault trees, completed by an instrument to draw the fault trees and by a code generator. During system testing, the code generated using the fault trees reacts to danger situations and signals, via the test environment, the software behavior presenting a danger to security. ESA

NPSNET-4: A REAL-TIME, 3D DISTRIBUTED INTERACTIVE VIRTUAL WORLD M.S. Thesis
Roy D. Young Sep. 1993 76 p
(AD-A274942) Avail: CASI HC A05/MF A01

The problems addressed by this research are to develop a new NPSNET simulator to allow simulations with any simulator that complies with the Distributed Interactive Simulation (DIS) protocol; to provide a more realistic simulation by maximizing the use of the Silicon Graphics Inc. (SGI) Reality Engine; and to provide for future extensions to the system. The approach taken for this research was to develop a DIS based simulator. To provide greater realism, Performer, a 3-D toolkit made by SGI, was used to take advantage of its multiprocessing management capabilities, real-time scene management, and other rapid rending tools. To enhance the systems extensibility, C++ object classes were used to encapsulate entity behaviors and user inputs. The result of this work is the NPSNET-IV simulation system. This system uses the DIS protocol to interact with other heterogeneously developed simulators as was demonstrated in a week long simulation between NPSNET-IV and two different simulation systems written by the Air Force Institute of Technology. Performer's direct access to the Reality Engine hardware and real-time scene management allows integration of more realistic models and higher rates of movement in the virtual world. The extensibility of the system is enhanced through the use of C++ objects, which was proven by the addition of a submersible vehicle type to the simulation. DTIC

RED'S NATURAL EDITOR: A PROGRAM DESIGNED TO EDIT FORTRAN PROGRAMS
D. E. Cullen 1 Sep. 1993 17 p
(Contract W-7405-eng-48)
(DE94-003271; UCRL-ID-115226) Avail: CASI HC A03/MF A01

This program allows the user to edit files using a completely natural method. You don't need a lot of time to learn how to use this program; it's as simple as using a typewriter. Even while you are reading this report you can start editing files. Although it is as simple as using a typewriter, this is a full screen editor, so that you can overwrite (replace) anything, delete or insert characters or lines, copy or move lines, and find or change anything. All of this can be done without using any complicated combinations of key strokes (as you are forced to memorize with other editors). This program is written in standard FORTRAN. Although it was designed and implemented on an IBM-PC, it can be easily adapted for use on virtually any graphics terminal. DOE

OPM SCHEME EDITOR 2: A GRAPHICAL EDITOR FOR SPECIFYING OBJECT-PROTOCOL STRUCTURES
I-Min A. Chen, Victor Markowitz, Francis Pang, and Ofer Ben-Shachar Jul. 1993 81 p
(Contract DE-AC03-76SF-00098)
(DE94-003477; LBL-33410) Avail: CASI HC A05/MF A01

This document describes an X-window based Schema Editor for the Object-Protocol Model (OPM). OPM is a data model that supports the specification of complex object and protocol classes. Objects and protocols are qualified in OPM by attributes that are defined over (associated with) value classes. Connections of object and protocol classes are expressed in OPM via attributes. OPM supports the specification (expansion) of protocols in terms of alternative and sequences of component (sub) protocols. The OPM Schema Editor allows specifying, displaying, modifying, and browsing through OPM schemas. The OPM Schema Editor generates an output file that can be used as input to an OPM schema translation tool that maps OPM schemas into definitions for relational database management systems. The OPM Schema Editor was implemented using C++ and the X11 based Motif toolkit, on Sun SPARCstation under Sun Unix OS 4.1. This document consists of the following parts: a tutorial consisting of seven introductory lessons for the OPM Schema Editor; a reference manual describing all the windows and functions of the OPM Schema Editor; and an appendix with an overview of OPM. THE CHACO USER'S GUIDE
B. Hendrickson and R. Leland Nov. 1993 28 p
(Contract DE-AC04-94AL-85000)
(DE94-003669; SAND-93-2339) Avail: CASI HC A03/MF A01

Graph partitioning is a fundamental problem in many scientific settings. This document describes the capabilities and operation of Chaco, a software package designed to partition graphs. Chaco allows for recursive application of any of several different methods for finding small edge separators in weighted graphs. These methods include inertial, spectral, Kernighan-Lin, and multilevel methods in addition to several simpler strategies. Each of these methods can be used to partition the graph into two, four or eight pieces at each level of recursion. In addition, the Kernighan-Lin method can be used to improve partitions generated by any of the other methods. Brief descriptions of these methods are provided, along with references to relevant literature. The user interface, input/output formats and appropriate settings for a variety of code parameters are discussed in detail, and some suggestions on algorithm selection are offered. DOE

USERS MANUAL FOR CATNIP: A COMPUTER ANALYSIS TOOL FOR NORMAL IMPACT PENETRATION
B. S. Altman Sep. 1993 16 p
(Contract DE-AC04-94AL-85000)
(DE94-003671; SAND-93-1749) Avail: CASI HC A03/MF A01

This program was developed to provide a computer based framework for analytical models to predict depth of penetration and temporal quantities for rigid non-deforming ogive-nose projectiles penetrating into a wide variety of targets. CATNIP provides results for penetration into semi-infinite targets, but does not provide for perforation events. The program has a graphical user interface to facilitate operation so that people unfamiliar with the analytical models can use the code with a minimum of training. CATNIP runs on Apple Macintosh computers using the Hypercard program. The Hypercard program is included with the system software on all Macintosh computers. A familiarity with the Macintosh use of pointing and clicking with the mouse is assumed for the use of this program. DOE

SOFTWARE ERROR ESTIMATION PROGRAM (SWEEP), VERSION 02.00.00 USER MANUAL
23 Dec. 1993 1 p
(Contract MDA972-92-J-1018)
(AD-A274697; SPC-92017-CMC) Avail: CASI HC A01/MF A01

One of the difficult challenges in today's software development environment is controlling and managing software errors. An error is defined as a detected failure; a failure is defined as a manifestation of the software product's inability to conform to requirements. Errors can also be referred to as defects; many people and projects use the terms interchangeably. SWEEP was developed to aid with the control and management of error data for software projects. It allows software error estimates that are useful in setting project goals and monitoring the quality of the software as it is developed. SWEEP uses software error data available early in the development cycle to project both the number of errors that will be found in later stages of development and the errors contained in the software when it is delivered (latent error content). Latent error content is expressed as an error density; however, if the user knows the size of the software code, the latent error content can easily be converted to the number of errors at delivery. SWEEP is useful to anyone involved with metrics (data collection and monitoring) or verification activities within a software life cycle. SWEEP can be used to make cost-effective decisions. DTIC

PROGRAMMING IN FORTRAN M
I. T. Foster, R. D. Olson, and S. J. Tuecke Oct. 1993 61 p
(Contract W-31-109-eng-38)
(DE94-002756; ANL-93/26-Rev-1) Avail: CASI HC A04/MF A01

Fortran M is a small set of extensions to Fortran that supports a modular approach to the construction of sequential and parallel programs. Fortran M programs use channels to plug together processes which may be written in Fortran M or Fortran 77. Processes communicate by sending and receiving messages on channels. Channels and processes can be created dynamically, but programs remain deterministic unless specialized nondeterministic constructs are used. Fortran M programs can execute on a range of sequential, parallel, and networked computers. This report incorporates both a tutorial introduction to Fortran M and a users guide for the Fortran M compiler developed at Argonne National Laboratory. The Fortran M compiler, supporting software, and documentation are made available free of charge by Argonne National Laboratory, but are protected by a copyright which places certain restrictions on how they may be redistributed. See the software for details. The latest version of both the compiler and this manual can be obtained by anonymous ftp from Argonne National Laboratory in the directory pub/fortran-m at info.mcs.anl.gov. DOE

PARALLEL GRID GENERATION ALGORITHM FOR DISTRIBUTED MEMORY COMPUTERS
Stuti Moitra and Anutosh Moitra (High Technology Corp., Hampton, VA.) Feb. 1994 20 p
(RTOP 505-90-53-02)
(NASA-TP-3429; L-17249; NAS 1.60:3429) Avail: CASI HC A03/MF A01

A parallel grid-generation algorithm and its implementation on the Intel iPSC/860 computer are described. The grid-generation scheme is based on an algebraic formulation of homotopic relations. Methods for utilizing the inherent parallelism of the grid-generation scheme are described, and implementation of multiple levELs of parallelism on multiple instruction multiple data machines are indicated. The algorithm is capable of providing near orthogonality and spacing control at solid boundaries while requiring minimal interprocessor communications. Results obtained on the Intel hypercube for a blended wing-body configuration are used to demonstrate the effectiveness of the algorithm. Fortran implementations bAsed on the native programming model of the iPSC/860 computer and the Express system of software tools are reported. Computational gains in execution time speed-up ratios are given. Author

DELTA f ALGORITHM
R. E. Denton (Dartmouth Coll., Hanover, NH.) and M. Kotschenreuther Nov. 1993 34 p
(Contract DE-FG05-80ET-53088)
(DE94-003120; IFSR-629; DOE/ET-53088/629) Avail: CASI HC A03/MF A01

The (delta)f Algorithm is a low noise particle code algorithm. The perturbation of the distribution function ((delta)f) away from a large equilibrium is evolved rather than the total distribution function. 'Particles' in the code are actually Lagrangian markers at which the value of the distribution functaion is known. The magnitude of the numerical noise is characteristic of the size of the perturbation rather than the equilibrium, and scales roughly as the inverse of the number of particles. The algorithm is described and conserved energies are derived for linear and nonlinear sets of equations. Two different forms of the energy principle test separately adequate resolution in time and space and adequacy of the number of simulation particles. A semi-implicit time step method is described which allows violation of the Courant condition. Low noise capabilities of a linear code using the algorithm are demonstrated. DOE

USEFULNESS OF COMPILE-TIME RESTRUCTURING OF LGDF PROGRAMS IN THROUGHPUT-CRITICAL APPLICATIONS M.S. Thesis
David M. Cross Sep. 1993 56 p
(AD-A274915) Avail: CASI HC A04/MF A01

In this thesis, the Large Grain Data Flow (LGDF) representation of parallelism is applied to throughput-critical applications that process periodically arriving data. The applications are represented by directed acyclic graphs in which a vertex represents an indivisible node program execution and an arc represents data flow from its source node to sink node. The machine and graph parameters are assumed to be such that the time to transfer one unit of data is comparable to the time to execute one operation at a processor. The machine model consists of a set of processors connected to a set of memory modules by a cross-bar interconnection network. Execution of LGDF graphs on such machines either requires a run-time mechanism to dispatch executable nodes on available processors or a compile-time static scheduling of nodes to processors. The former approach, although flexible and robust, suffers from contention-related overhead and the latter, although capable of eliminating contention, is rigid and computationally intensive. It is shown by simulation that throughput can be improved when compile-time graph restructuring is coupled with simple first-come-first-serve dispatching. The restructuring is based on selectively adding control dependencies between graph nodes. This technique, called the revolving cylinder analysis, is shown to be an effective framework for achieving communication/computation overlap and reducing memory contention. DTIC

EXTRACTING COMPLETE 3-DIMENSIONAL BOUNDARY REPRESENTATION FROM MULTIPLE RANGE IMAGES M.S. Thesis
Zukang Xu Jun. 1992 119 p
(ISBN-0-315-83776-4; CTN-94-61034) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

An important problem in computer vision is that of generating a three dimensional (3D) description of objects from sensed data. In robotics applications, 3D descriptions require explicit geometric and topological relations between faces, edges, and vertices, and are very similar to boundary representation (b-rep) used in solid modeling. An approach is presented for extracting a complete b-rep description of a polyhedral object from range images taken from multiple viewpoints. The system starts from basic face models of visible surfaces of objects in each local view, extracts features, matches those features, generates rigid body transformations that relate the local views, and finally merges these views into a complete 3D b-rep description of the object. In a matching algorithm, a triple branch structure is defined as the main feature to determine correspondence. A coarse-to-fine search stragegy and a prioritizing procedure are designed to reduce the search time even further. The b-rep model is incrementally updated by merging each of the local views in a global description. A convenient and effective termination criterion is designed to monitor the integration process. The system has been implemented in C, and a synthetic range image generator has also been implemented. The system has been tested on several synthetic range images. Author (CISTI)

AN INTERACTIVE, PHYSICALLY-BASED SIMULATION SYSTEM M.S. Thesis
Allan Neill Snider Jul. 1992 129 p
(ISBN-0-315-83884-1; CTN-94-61035) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A system to animate dynamic deformable models incorporates physically based techniques to determine motion. Models understood by the system consist of simple text format descriptions of non-rigid bodies composed of spring-mass and torque-spring constructions with surface tessellations providing geometric shape. Numerical integration techniques including a second order Runge-Kutta technique (improved Euler's or Heun's method) are used to advance these models in time, using small regular increments, and their motion is graphically displayed. Real-time interaction with the system is provided by means of control panels. A general purpose implementation of the system is given, as well as additional components used to render and produce realistic video animations. Model display modes, model definitions, animation control, and animation production aspects of the implementation (the ANIM computer program) are presented and illustrated with test experiments. APPLICATION OF MARKOV RANDOM FIELD THEORY TO IMAGE CODING AND MOTION ESTIMATION M.S. Thesis
Peifang Zhou 1993 83 p
(ISBN-0-315-83435-8; CTN-94-61042) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Two applications of Markov random field theory to image coding and motion estimation are presented. Markov random fields are first used to model the correlation in the image intensity fields. A noncausal and nonlinear image coding scheme is proposed in which the estimation of present pixel is based on both past and future neighboring pixels. Two decoding algorithms are developed. Open-loop and closed-loop quantizer structures are implemented for noncausal prediction. Secondly, Markov random fields are used to model the smoothness inherent in the image motion fields. The motion estimation problem is formulated in the framework of maximum a posteriori estimation and smoothness constraints are imposed to regulate the motion fields. A deterministic multipass prediction algorithm is developed as an alternative to stochastic simulated annealing. A multi workstation version of both multipass prediction and simulated annealing algorithms is implemented. Author (CISTI)

(NPL-DITC-215/93; ETN-94-95282) Copyright Avail: Issuing Activity (National Physical Lab., Teddington, Middlesex, TW11 OLW, England)

A method for generating tests using a formalized test purpose notation to guide the system is reported. The automatic derivation of test cases from formalized protocol specifications is an increasingly important research topic. The means by which the number and type of test cases output from such a generator may be controlled is of importance. The work described is a development from earlier work on test generation, based on the Class 0 protocol and a limited Class 4 subset. The general principles developed in those projects were used as the basis for the new work. The main limitation of the earlier work was that the Class 4 specification used omitted many of the features of the protocol, and could only deal with a small set of example test purposes. The new specification covers all the main Class 4 features, excluding network layer events and network connection management. This was developed by extending the original specification, while retaining essentially the same structure. ESA

INTEGRATING AUTOMATA WITH GENETIC ALGORITHMS IN ORDER TO PROVIDE ADAPTIVE OPERATORS M.S. Thesis
Anthony Richard Phil White 12 May 1993 215 p
(ISBN-0-315-84094-3; CTN-94-61052) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Genetic algorithms are loosely based on the principles of the survival of the fittest and exploitation of genetic material from one generation to the next. Genetic algorithms have shown themselves to be successful in solving a wide range of combinatorial problems. Genetic algorithms have traditionally required the specification of a number of parameters that control the evolutionary process, two of these being related to the probability of applying the mutation and crossover operators. Extensions are proposed to the classical genetic algorithm model. In the classical model, the aforementioned mutation and crossover operator probabilities are specified before the start of a genetic algorithm run and remain unchanged, a so-called static model. In the extended model, automata are used to allow the adaptation of these operator probabilities as the run progresses in order to improve the quality of the solutions found. Favorable results have been achieved for a wide range of function minimization problems. Author (CISTI)

FAST INCREMENTAL COMPILER TRANSFORMATIONS FOR MULTIPLE INSTRUCTION RETRY
Shyh-Kwei Chen, Neal J. Alewine, W. K. Fuichs, and Wen-Mei W. Hwu Jul. 1992 25 p
(Contract NAG1-613; N00014-91-J-1283)
(NASA-CR-195209; NAS 1.26:195209; AD-A274290) Avail: CASI HC A03/MF A01

Previous work on compiler-assisted multiple instruction retry has utilized a series of compiler transformations, loop protection, node splitting, and loop expansion, to eliminate anti-dependencies of length less than N in the pseudo register, machine register, and the post-pass resolver phases of compilation. The results have provided a means of rapidly recovering from transient processor failures by rolling back N instructions. This paper presents techniques for improving compilation and runtime performance in compiler-assisted multiple instruction retry. Incremental updating enhances compilation time when new instructions are added to the program. Post-pass code rescheduling and spill register reassignment algorithms improve the run-time performance and decrease the code growth across the application programs studied. Branch hazards axe also shown to be resolvable by simple modifications to the incremental updating schemes during the pseudo register phase and to the spill register reassignment algorithm during the post-pass phase. PROBABILISTIC METHODS FOR IMAGE GENERATION AND ENCODING Final Report, 15 May 1990 - 14 May 1993
Marc A. Berger 15 Oct. 1993 9 p
(Grant AF-AFOSR-0288-90)
(AD-A274294; AFOSR-93-0894TR) Avail: CASI HC A02/MF A01

The research described herein involves a new digital image compression algorithm. A hybrid low-pass filter/fractal technique was developed, taking advantage of the fact that fractals afford a remarkable way of compressing high frequency data. The low frequency content of the image is stored without loss, and then fractal image processing is used to touch-up the high frequency features, with some loss. An image compression software system has been built around this. The system handles 24-bit digital images of arbitrary resolution. Compression is quick - for example, the system compresses a still 1280 x 1024 (high-definition) image in a few seconds on a Personal Iris (6 MFlops); and also decompresses in a few seconds. At low compression (around 15:1), the compression is visually lossless. At high compression (around 100:1), there is some loss, but not much. DTIC

PARALLEL MATRIX TRANSPOSE ALGORITHMS ON DISTRIBUTED MEMORY CONCURRENT COMPUTERS
J. Choi, D. W. Walker, and J. J. Dongarra (Tennessee Univ., Knoxville.) Oct. 1993 27 p
(Contract DE-AC05-84OR-21400)
(DE94-002424; ORNL/TM-12309) Avail: CASI HC A03/MF A01

This paper describes parallel matrix transpose algorithms on distributed memory concurrent processors. It is assumed that the matrix is distributed over a P x Q processor template with a block scattered data distribution. P, Q, and the block size can be arbitrary, so the algorithms have wide applicability. The communication schemes of the algorithms are determined by the greatest common divisor (GCD) of P and Q. If P and Q are relatively prime, the matrix transpose algorithm involves complete exchange communication. If P and Q are not relatively prime, processors are divided into GCD groups and the communication operations are overlapped for different groups of processors. Processors transpose GCD wrapped diagonal blocks simultaneously, and the matrix can be transposed with LCM/GCD steps, where LCM is the least common multiple of P and Q. The algorithms make use of non-blocking, point-to-point communication between processors. The use of nonblocking communication allows a processor to overlap the messages that it sends to different processors, thereby avoiding unnecessary synchronization. Combined with the matrix multiplication routine, C = A(center dot)B, the algorithms are used to compute parallel multiplications of transposed matrices, C = A(sup T)(center dot)B(sup T), in the PUMMA package. Details of the parallel implementation of the algorithms are given, and results are presented for runs on the Intel Touchstone Delta computer. DOE

The Computational Mechanics thrust area sponsors research into the underlying solid, structural, and fluid mechanics and heat transfer necessary for the development of state-of-the-art general purpose computational software. The scale of computational capability spans office workstations, departmental computer servers, and Cray-class supercomputers. The DYNA, NIKE, and TOPAZ codes have achieved world-wide fame, through our broad collaborators program, in addition to their strong support of on-going Lawrence Livermore National Laboratory (LLNL) programs. Several technology transfer initiatives have been based on these established codes teaming LLNL analysts and researchers with counterparts in industry and extending code capability to specific industrial interests of casting, metalforming, and automobile crash dynamics. The next-generation solid/structural mechanics code, ParaDyn, is targeted toward massively parallel computers, which will extend performance from gigaflop to teraflop power. Our work for FY-92 is described in the following eight articles: (1) Solution Strategies: New Approaches for Strongly Nonlinear Quasistatic Problems Using DYNA3D; (2) Enhanced Enforcement of Mechanical Contact: The Method of Augmented Lagrangians; (3) ParaDyn: New Generation Solid/Structural Mechanics Codes for Massively Parallel Processors; (4) Composite Damage Modeling; (5) HYDRA: A Parallel/Vector Flow Solver for Three-Dimensional, Transient, Incompressible Viscous Flow; (6) Development and Testing of the TRIM3D Radiation Heat Transfer Code; (7) A Methodology for Calculating the Seismic Response of Critical Structures; and (8) Reinforced Concrete Damage Modeling. DUSOL: IMPROVED SOFTWARE FOR ANALYSIS OF ULTRASONIC VELOCITY DATA ON ANISOTROPIC MATERIALS
A. Woolf Jun. 1993 26 p
(NPL-DMM(A)-104; ETN-94-95225; PB94-105061) Copyright Avail: Issuing Activity

The program for computing stiffness components, compliances, and engineering elastic constants for composite materials was developed. Velocity measurements taken from the ultrasonic immersion method were used. The method is applicable to transversely isotropic, tetragonal, and orthotropic materials. An example is included. The ultrasonic method, the stages of the computation, and how the data is prepared for each stage are presented. Operating instructions and examples are given. Notes on the mathematics for computing the compliances and engineering elastic constants are included. ESA

A FORMALIZATION OF OBJECTS USING EQUATIONAL DYNAMIC LOGIC
R. J. Wieringa Feb. 1993 25 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-125218; IR-324) Avail: Issuing Activity (National Technical Information Service (NTIS))

Order-sorted equational logic is extended with dynamic logic to a specification language for dynamic objects. Special attention is paid to different concepts of encapsulation that play a role in object-orientation. It is argued that the resulting language, CMSL, meets those requirements of the object-oriented database system manifesto that are applicable to object-oriented conceptual models (as opposed to object-oriented databases). AN AUTOMATIC CONTACT ALGORITHM IN DYNA3D FOR IMPACT PROBLEMS
R. G. Whirley and B. E. Engelmann 23 Jul. 1993 11 p Presented at the IMPACT-4: Structural Mechanics in Reactor Technology Conference, Berlin, Germany, 23-24 Aug. 1993
(Contract W-7405-eng-48)
(DE94-002856; UCRL-JC-114820; CONF-9308161-2) Avail: CASI HC A03/MF A01

A new approach for the automatic definition and treatment of mechanical contact in explicit nonlinear finite element analysis is presented. Automatic contact offers the benefits of significantly reduced model construction time and fewer opportunities for user error, but faces significant challenges in reliability and computational costs. Key aspects of the proposed new method include automatic identification of adjacent and opposite surfaces in the global search phase, and the use of a well-defined surface normal which allows a consistent treatment of shell intersection and corner contact conditions without an ad-hoc rules. Three examples which illustrate the performance of the newly proposed algorithm in the public DYNA3D code are given. DOE

COMBINING LOGICS
Agoston Eiben, Andras Janossy (Hungarian Academy of Sciences, Budapest.), and Agnes Kurucz (Hungarian Academy of Sciences, Budapest.) Dec. 1993 33 p Prepared in cooperation with Magyar Tudomanyos Akademia, Budapest. Mathematical Inst.
(PB94-125242; IR-319) Avail: CASI HC A03/MF A01

In this paper, we investigate connections between different logics. In particular, we are interested in a special kind of connection, when a logic is a 'mixture' of other logics. We give four natural and intuitive criteria that need to be satisfied by 'mixtures' of logics and an additional fifth one for the method of combination. We rely on a general notion of a logic and we study two frameworks for combining logics in connection with the above criteria. The first concept is a reformulation of Gabbay's fibered semantics, whereas the second one defines the 'mixture' of logics as a colimit construction in the category of logics. NTIS

HARD REAL-TIME RELIABLE MULTICAST IN THE DEDOS SYSTEM
D. Alstein and P. vanderStok Jun. 1993 32 p
(PB94-126745; COMPUTING SCIENCE NOTES-93/17) Avail: CASI HC A03/MF A01

Two protocols for reliable multicast in a multiprocessor system are presented. The protocols use mailboxes located in common memory to exchange messages, instead of relying on communication channels. The mailboxes are replicated for reliability. The protocols have bounded completion time, making them suitable for use in hard real-time systems. Multiple source ordering is imposed on the messages that pass through a mailbox. The protocols are shown to be tolerant of memory crashes, and of process or processor failures. The basic protocol tolerates only crash failures of processes, while the second protocol can also handle timing failures. The protocols can be extended so that multicast group membership is dynamic. NEW MIXED INTEGER ALGORITHM FOR CLASSIFICATION AND PLACEMENT OF MEASUREMENTS IN PROCESS FLOW NETWORKS
P. J. Immonen Aug. 1993 61 p
(PB94-126752; ISBN-951-22-1742-2) Avail: CASI HC A04/MF A01

The purpose of this report is to introduce a new approach to the assessment of metering systems through flowsheet analysis. The method determines an index called the degree of calculability for each process quantity, providing a unified classification method for both measured and unmeasured variables. The computation of the index is done through mixed integer programming, utilizing the linear or linearized plant model in a straight-forward fashion. Single-component flow systems form a special class of applications that can be transformed into network linear programming problems, facilitating much faster solutions. The classification algorithms also identify the new measurements that would increase the degree of calculability. A practical plant example is also given. - NTIS

(PB94-126703; CSN-93/21) Avail: CASI HC A03

Several proposals for computing freeness information for logic programs have been put forward in recent literature. This paper introduces a novel domain of abstract equation systems describing possible sharing and definite freeness of terms in a system of equations. A simple and intuitive abstract unification algorithm is presented, providing the core of a correct and precise sharing and freeness analysis for logic programs. Our contribution is not only a correct algorithm, but perhaps primarily, the systematic approach in which it is derived by mimicking each step in a suitable concrete unification algorithm. Consequently, the abstract algorithm is intuitive--as it resembles the concrete algorithm. It is easy to justify--as the proof of correctness boils down to showing that each step in the concrete algorithm is mimicked by a corresponding step in the abstract algorithm. Finally, it is precise--as each step mimics only those situations which can arise in the concrete algorithm. NTIS

CENTRAL DYNAMIC SHARE SCHEDULING IN DISTRIBUTED SYSTEMS
J. F. C. M. deJongh 1993 50 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0922-5641)
(Rept-93-48; ETN-94-95402) Copyright Avail: CASI HC A03

The objectives for share scheduling policies in distributed computing systems are reported. Performance measures to evaluate such policies are defined. The major objectives of share scheduling are: compliance with share objectives, and avoidance of capacity loss. Shares are defined as fractions of the processing capacity that are used to serve a group of jobs. Capacity loss occurs if at least one processor is idle while at another processor two or more jobs are present. A number of central dynamic initial placement policies for share scheduling in homogeneous distributed computing systems are proposed. A scheduling policy consists of two components: a global scheduling policy, which decides which processor serves which job, and a local scheduling policy, which decides when to serve a job on the processor it is assigned to. Jobs arrive according to independent Poisson processes, one for each group. Service times for 'all' jobs are identically distributed exponential random variables. The results indicate that if the system consists of only one processor, a scheduling policy called group priority processor sharing can be effectively used for share scheduling. ESA

We proposed a syntactic format, the panth format, for structured operational semantics. In addition to ordinary transitions, predicates, negated predicates, and negated transitions may occur if the rules are stratifiable, and the strong bisimulation equivalence is a congruence for all the operators that can be defined within the panth format. To show the utility of this format, we took some examples from the literature. The examples touch upon issues such as priorities, termination, convergence, discrete time, recursion, (infinitary) Hennessy-Milner logic, and universal quantification. NTIS

TRACE-BASED COMPOSITIONAL PROOF THEORY FOR FAULT TOLERANT DISTRIBUTED SYSTEMS
Henk Schepers and Jozef Hooman Jun. 1993 36 p
(ISSN 0926-4515)
(PB94-126737; CSN-93/16) Avail: CASI HC A03/MF A01

We present a compositional network proof theory to specify and verify safety properties of fault tolerant distributed systems. In this proof, we abstract from the precise nature and occurrence of faults, but model their effect on the externally visible input and output behavior. To this end, we formalize a fault hypothesis as a reflexive relation between the normal behavior (i.e. the behavior when no faults occur) of a system and its acceptable behavior, that is, the normal behavior together with the exceptional behavior (i.e. the behavior whose abnormality should be tolerated). The method is compositional to allow for the reasoning with the specifications of processes while ignoring their implementation details. This compositionality is achieved by starting from a SAT formalism to reason about the normal behavior and extending it with a single rule to obtain a specification of the acceptable behavior from the specification of the normal behavior and a predicate characterizing the fault hypothesis. We prove soundness and relative network completeness of the method. Our approach is illustrated by applying it to a triple modular redundant component and the alternating bit protocol. NTIS

WHAT CAN WE LEARN FROM GENETIC ALGORITHMS: A NEW PERSPECTIVE FOR SEARCH METHODS

Agoston Eiben Dec. 1992 27 p
(PB94-125234; IR-320) Avail: CASI HC A03/MF A01

This paper is concerned with search methods, in particular with genetic algorithms (GA's) and their status in artificial intelligence (AI). We describe and study GA's in the context of classic AI search techniques, such as depth-first or A*. By systematically studying similarities and differences between general search methods and genetic algorithms, we have established a place for GA's in the AI search family. GA's are distinguished by relying on a fixed data structure of the search space and a standard child construction mechanism. In the second part of this paper we surpass GA traditions concerning these aspects and generalize along two axes. We discuss non-standard data types and child construction mechanisms with an arbitrary number of parents. Hereby we also achieve a general framework, a shell, to define basic search operators. Finally, we summarize what we can learn from genetic algorithms and sketch the outlines of a scientific program for developing and investigating new kinds of search methods. NTIS

MEMORY SUBSYSTEM PERFORMANCE OF PROGRAMS WITH INTENSIVE HEAP ALLOCATION

Amer Diwan, David Tarditi, and Eliot Moss 13 Dec. 1993 46 p
(Contract F19628-91-C-0168; ARPA Order 8313)
(AD-A274122; CMU-CS-93-227) Avail: CASI HC A03/MF A01

Heap allocation with copying garbage collection is a general storage management technique for modern programming languages. It is believed to have poor memory subsystem performance. To investigate this, we conducted an in-depth study of the memory subsystem performance of heap allocation for memory subsystems found on many machines. We studied the performance of mostly-functional Standard ML programs which made heavy use of heap allocation. We found that most machines support heap allocation poorly. However, with the appropriate memory subsystem organization, heap allocation can have good performance. The memory subsystem property crucial for achieving good performance was the ability to allocate and initialize a new object into the cache without a penalty. This can be achieved by having subblock placement with a subblock size of one word with a write allocate policy, along with fast page-mode writes or a write buffer. For caches with subblock placement, the data cache overhead was under 9% for a 64-K of larger data cache: without subblock placement the overhead was often higher than 50%. DTIC

COMBINING SHAPE AND COLOR INFORMATION FOR 3D OBJECT RECOGNITION

Kazunori Higuchi, Martial Hebert, and Katsushi Ikeuchi Dec. 1993 19 p
(Contracts F33615-90-C-1465; F33615-93-1-1282; NSF IRI-92-24521)
(AD-A274123; CMU-CS-93-215) Avail: CASI HC A03/MF A01

Both photometric and geometric information are important for 3D object recognition. Traditionally, however, few systems utilized both types of information. This is because no single representation is suitable for both types of information. This paper proposes a method for representing both color and geometric information using a common framework, the Spherical Attribute Image (SAI). The SAI maps the values of curvature and color computed at every node of a mesh approximating the object surface onto a spherical image. A model object and an observed surface are computed by finding the rotation that brings their spherical images into correspondence. We show how this matching algorithm can be used for object recognition using both geometric and photometric information. In addition, we describe how the two types of information can be combined in a way that takes into account their actual distribution on the surface. DTIC

DEFERRED COMPILATION: THE AUTOMATION OF RUN-TIME CODE GENERATION

Mark Leone and Peter Lee Dec. 1993 21 p
(Grant NSF CCR-90-57567)
(AD-A274124; CMU-CS-93-225) Avail: CASI HC A03/MF A01

This paper describes deferred compilation, an alternative and complement to compile-time program analysis and optimization. By deferring aspects of compilation to run time, exact information about programs can be exploited, leading to greater opportunities for code improvement. This is in contrast to the use of static analyses, which are inherently conservative. Deferred compilation automates the translation of ordinary programs into native machine code that performs fast optimization and native-code generation at run time. Automation is obtained through the use of a compile-time staging analysis, which determines the portions of a program that may be safely and profitably compiled at run time. Fast run-time optimization is obtained by trading space for time: compile-time specialization yields numerous run-time code generators, each customized to optimize a small portion of the source program based on run-time information.

Implementation strategies developed for a prototype compiler are discussed, and the results of preliminary experiments demonstrating significant overall speedup are presented. DTIC

AN OBJECT-ORIENTED DATABASE INTERFACE FOR Ada M.S. Thesis
Anthony D. Moyers Dec. 1993 67 p
(AD-A274391; AFIT/GCE/Eng/93D-11) Avail: CASI HC A04/MF A01

Object data management (ODM) is currently at the forefront of research and development efforts in the database community. In order to take advantage of ODM technology, the Department of Defense (DoD) needs to ensure that these systems are accessible to Ada programmers. The Air Force Institute of Technology (AFIT) is conducting research towards the development of an Ada ODM interface to existing ODM systems. The design goals are portability, transparency, and completeness for Ada programmers. Portability means that the ODM system can be changed without affecting any existing application programs. Transparency means that Ada programmers can use the interface without having to know different programming languages or specifics about the different systems being used. Completeness means that all of the functionality of the ODM systems are available to Ada application developers. This thesis defines requirements for an Ada ODM interface and proposes a design. In addition, the challenges associated with implementation are investigated using commercial ODM systems at AFIT. Implementation of the interface is based on the use of Ada bindings to the existing application program interfaces (API's) of the ODM systems. A preprocessor will be necessary in order to achieve transparency. DTIC

GENETIC ALGORITHMS APPLIED TO A MISSION ROUTING PROBLEM M.S. Thesis
James B. Olsan Dec. 1993 125 p
(AD-A274130; AFIT/GCE/Eng/93-12) Avail: CASI HC A06/MF A02

This thesis applies genetic algorithms to a mission routing problem. The mission routing problem involves determining an aircraft's best route between a staging base and a target. The goal is to minimize the route distance and the exposure to radar. Potential routes are mapped to a 3-dimensional mesh where the nodes correspond to checkpoints in the route and the arcs correspond to partial paths of the route. Each arc is weighted with respect to distance and exposure to radar. A genetic algorithm is a probabilistic search technique loosely based on theories of biological evolution. Genetic crossover and survival of the fittest are the basis of a genetic algorithm's control structure and can be used for general problems. Encoding and evaluation of the data structure is problem specific. This thesis focuses on approaches to mapping the mission routing problem's mesh to a data structure which the genetic algorithm's control structure can effectively and efficiently manipulate. Three broad methods are proposed: Bounded Progress, Free Progress, and Restricted Progress. The Bounded Progress method uses a tightly-coupled mesh while the Free Progress method uses a loosely-coupled mesh. The Restricted Progress method is a hybrid of the other two methods. DTIC

ALTERNATIVE ARCHITECTURES FOR DOMAIN-ORIENTED APPLICATION COMPOSITION AND GENERATION SYSTEMS M.S. Thesis
Warren E. Gool Dec. 1993 130 p
(AD-A274180; AFIT/GCS/Eng/93D-11) Avail: CASI HC A07/MF A02

This thesis presents a formalized framework for comparing the structure and semantics of software architectures. The framework uses object diagrams for analyzing the structure of the architectures and the axiomatic approach for analyzing the semantics. This framework is used to compare the Object Connection Update (OCU) model (developed by the Software Engineering Institute) against four other software architectures: VHDL defined by Lipsett, MetaH defined by Honeywell, microRapide defined by Luckham, and hierarchical software systems as defined by Batory. The goal of the comparison was to evaluate the OCU model for suitability within prototype application composition and generation systems. This research concluded that the OCU model has all the elements necessary for use in application composition and generation systems. Additionally, the framework identified several common elements in all the software architectures. These common elements may lead to the development of a meta-model for software architectures. DTIC

USERS GUIDE FOR GRIKURV: A CODE FOR DRAWING GRAPHS [ANVAENDARHANDLEDNING TILL GRIKURV: ETT PROGRAM FOER DIAGRAMRITNING]
A. Collin Jun. 1993 14 p In SWAHILI
(PB94-123593; FOA-C-20933-2.7) Avail: Issuing Activity (National Technical Information Service (NTIS))

GRIKURV is a c(K)URV drawing-code for xy-data and designed for personal computers with MS-DOS. The programming language is TURBO-PASCAL, and the code consists of a main program and a number of separately compiled units. It is possible to choose the columns that should compose coordinates with a table editor, and there is also an opportunity to edit data. Curves can be drawn by certain methods, such as the least-square-method, the method of Bezier-fitting, or by interpolation with splines. Formulas with one variable and parameters can also be fed to the code by the means of an editor of formulas. Several curves can be included in the graph and text can be inserted by a cursor. This is all done in dialog with the user. The graph can be written out in the format of HPGL, the format of PostScript or through a file. NTIS

TRANSLATION AND ROTATION INVARIANT PATTERN RECOGNITION [TRANSLATIONS- OCH ROTATIONSINVARIANT MOENSTERIGENKAENNING]
S. Posluk and M. Bengtsson Feb. 1993 50 p In SWEDISH
(PB94-123676; FOA-C-30702-8.4,3.4) Avail: Issuing Activity (National Technical Information Service (NTIS))

This report introduces a method for 2D pattern representations, which has explicit and simultaneous translation and rotation invariance. In contrast to previous efforts in this direction, we do not rely on center of gravity calculations and subsequent resampling of the image. Instead the fourier transformed image is used as input to a rotation invariant operator, i.e., the image is transformed twice. This results in a translation and rotation invariant representation since the rotation operator commutes with the fourier transform. The invariant features are then used as input to a neural network classifier. The result is a robust and noise insensitive system. NTIS

THE COMMUNICATION LINK AND ERROR ANALYSIS (CLEAN) SIMULATOR Semiannual Report, 1 Jul. 1993 - 30 Jun. 1994
William J. Ebel, Frank M. Ingels, and Shane Crowe Dec. 1993 47 p
(Grant NAG5-2006)
(NASA-CR-195243; NAS 1.26:195243) Avail: CASI HC A03/MF A01

During the period July 1, 1993 through December 30, 1993, significant developments to the Communication Link and Error ANalysis (CLEAN) simulator were completed and include: (1) Soft decision Viterbi decoding; (2) node synchronization for the Soft decision Viterbi decoder; (3) insertion/deletion error programs; (4) convolutional encoder; (5) programs to investigate new convolutional codes; (6) pseudo-noise sequence generator; (7) soft decision data generator; (8) RICE compression/decompression (integration of RICE code generated by Pen-Shu Yeh at Goddard Space Flight Center); (9) Markov Chain channel modeling; (10) percent complete indicator when a program is executed; (11) header documentation; and (12) help utility. The CLEAN simulation tool is now capable of simulating a very wide variety of satellite communication links including the TDRSS downlink with RFI. The RICE compression/decompression schemes allow studies to be performed on error effects on RICE decompressed data. The Markov Chain modeling programs allow channels with memory to be simulated. Memory results from filtering, forward error correction encoding/decoding, differential encoding/decoding, channel RFI, nonlinear transponders and from many other satellite system processes. Besides the development of the simulation, a study was performed to determine whether the PCI provides a performance improvement for the TDRSS downlink. There exist RFI with several duty cycles for the TDRSS downlink. We conclude that the PCI does not improve performance for any of these interferers except possibly one which occurs for the TDRS East. Therefore, the usefulness of the PCI is a function of the time spent transmitting data to the WSGT through the TDRS East transponder. Author

MOTION ANALYSIS FROM A SEQUENCE OF RANGE IMAGES Ph.D. Thesis
Peiying Zhu Apr. 1993 232 p
(ISBN-0-315-84684-4; CTN-94-61086) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The feasibility of recovering motion from a sequence of range images is investigated as an alternate solution to the complex motion problem. An approach to finding matching features in two or more successive images is proposed using a Hopfield neural network. A model is developed to convert the correspondence problem to the problem of minimizing an energy function. After establishing the feature matching, a delta-bound matching concept is introduced to detect the reliable matching features. The algorithm used is tolerant to noise due to feature detection or occlusion. For the case of a single rigid moving object, a simple but powerful algorithm is proposed to estimate motion. The motion problem is modelled as solving a set of linear equations. A weighted least squares technique provided the best performance. For more complicated motion such as nonrigid motion, low-level processing was considered. An algorithm was developed which uniquely estimates three dimensional velocities of points on smooth surfaces, and another algorithm based on the correlation of the local structure of principal curvatures was developed to provide reliable estimates of velocities near edge points. The former algorithm is computationally fast while the latter is computationally intensive. It is suggested that the two algorithms be combined to give the best performance. Author (CISTI)

PRODUCTION OF A COMPUTER BASED LESSON TEACHING EMPLOYEES HOW TO USE AN AIR DATA TESTER M.S. Thesis
Deborah Lynn Barker Oct. 1992 140 p
(ISBN-0-315-84708-5; CTN-94-61091) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A computer-based lesson was developed in order to provide aircraft maintenance personnel with quality and timely training concerning the operation of a new air data tester. These new-generation testers are used for checking and calibrating certain aircraft systems and operate in a manner significantly different from the ones they replace. Dick and Carey's (1985) instructional design model was used to guide the design of the lesson. Using Air Canada equipment and the WISE authoring system, a portion of the lesson was produced. Three types of people participated in a formative evaluation of the lesson. An instructional design expert evaluated the design of the lesson and found it acceptable. A subject matter expert evaluated the programmed portion of the lesson for technical accuracy. A few minor changes were required. Eight members of the target population worked through the lesson's programmed portion. Oral and written comments were positive, and some technical errors were identified. There was a statistically significant improvement between the pre-test (35 percent) and post-test (93 percent) mean scores indicating that the students learned from the program. Author (CISTI)

DEVELOPMENT OF DIGITAL RESAMPLING AND PULSE COMPRESSION COMPUTER SOFTWARE
P. Scrimger, I. Schumacher, R. L. Kirlin (Victoria Univ., British Columbia.), and W. Du (Victoria Univ., British Columbia.) 1992 51 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(DREP-92-32; DSIS-94-00230; CTN-94-61093) Avail: Issuing Activity

Five digital resampling and pulse compression computer programs are described. These include a program for generating maximum length binary sequences (M-sequences), a digital resampling program, a data rescaling program, a program for demodulating a phase modulated signal of known frequency, and a signal cross correlation program. The use of these programs is also outlined and program examples are included. The five programs can be used to examine M-sequences which are often used when measuring propagation delays under extremely noisy multipath conditions such as those which existed in the Heard Island Feasibility Test. An appendix is included which describes a technique for carrier frequency estimation and phase unwrapping. Author (CISTI)

ESTIMATION OF IMAGE MOTION IN SCENES CONTAINING MULTIPLE MOVING OBJECTS Ph.D. Thesis
Heyun Zheng Jul. 1993 158 p
(ISBN-0-315-85208-9; CTN-94-61101) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

An error weighted regularization algorithm for image motion field estimation is proposed as a computationally attractive alternative to stochastic optimization based schemes. Block matching errors in the local motion measurement process are used in the regularization functional to avoid oversmoothing across motion boundaries. A second algorithm, anisotropic regularization, improves on the local measurement process by employing alternative matching criteria and matching window organization. A selective confidence measure derived from local anisotropic measurements is used to further improve the error weighted regularization. For moving object estimation needed in object oriented video coding applications, a new optimality criterion based on the minimum description length (MDL) principle is developed. In the proposed MDL estimator, the cost to be minimized is the sum of the ideal coding lengths for the motion parameters, boundaries, and motion compensated predictive errors of all moving objects in a scene. An optimization procedure to obtain a suboptimal MDL estimator is proposed based on a region-merging framework. A number of experimental comparisons has shown a significant ideal coding rate reduction of the object oriented coding scheme using an MDL estimator over a standard block-oriented scheme. POLYHEDRAL CHARACTERIZATION OF THE ECONOMIC LOT-SIZING PROBLEM WITH START-UP COSTS
C. P. M. vanHoesel, A. P. M. Wagelmans (Erasmus Univ., Rotterdam, Netherlands.), and L. A. Wolsey (CORE International, Inc., Louvain-la-Neuve, Belgium.) Nov. 1992 23 p
(ISSN 0926-4493)
(MEMO-COSOR-92-46; ETN-94-94807) Avail: CASI HC A03/MF A01

A class of strong valid inequalities for the single item uncapacitated economic lot sizing problem with start up costs is described. It is shown that these inequalities yield a complete polyhedral characterization of the problem. The corresponding separation problem is formulated as a shortest path problem. A reformulation as a plant location problem is shown to imply the class of strong valid inequalities. The polynomial size uncapacitated facility location reformulation is shown to be tight. These results are of a purely theoretical nature. Computational testing should reveal which of the two formulations is best used in practical problems in which the economic lot sizing problem with start up costs appears as a relaxation. ESA

SHARED VIRTUAL MEMORY AND GENERALIZED SPEEDUP Final Report

Xian-He Sun and Jianping Zhu Jan. 1994 24 p Submitted for publication
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191592; ICASE-94-2; NAS 1.26:191592) Avail: CASI HC A03/MF A01

Generalized speedup is defined as parallel speed over sequential speed. The generalized speedup and its relation with other existing performance metrics, such as traditional speedup, efficiency, scalability, etc., are carefully studied. In terms of the introduced asymptotic speed, it was shown that the difference between the generalized speedup and the traditional speedup lies in the definition of the efficiency of uniprocessor processing, which is a very important issue in shared virtual memory machines. A scientific application was implemented on a KSR-1 parallel computer. Experimental and theoretical results show that the generalized speedup is distinct from the traditional speedup and provides a more reasonable measurement. In the study of different speedups, various causes of superlinear speedup are also presented. Author (revised)

Stable models seem to be a natural way to describe the beliefs of a rational agent. However, the definition of stable models itself is not constructive. It is therefore interesting to find a constructive characterization of stable models, using a fixpoint construction. The operator defined is based on the work of F. Fages (among others). For this operator, every total stable model of a general logic program will coincide with the limit of some (infinite) sequence of interpretations generated by it. The set of all stable models will coincide with certain interpretations in these sequences. The least fixpoint of the Fitting operator and the well founded model is characterized using the operator. A STRATEGY FOR DYNAMIC INTERPRETATION: A FRAGMENT AND AN IMPLEMENTATION
Olivier Bouchez, D. Jan N. vanEijck (OTS, Utrecht, Netherlands.), and Olivier Istace Mar. 1993 26 p Presented at the Association for Computational Linguistics' European Chapter 6th Conference, Utrecht, Netherlands, 21-23 Apr. 1993 Submitted for publication
(ISSN 0169-118X)
(CWI-CS-R9317; ETN-94-95430) Copyright Avail: CASI HC A03/MF A01

A strategy for natural language interpretation which implements the dynamics of context change by translating natural language texts into a meaning representation language consisting of (descriptions of) programs, in the spirit of Dynamic Predicate Logic (DPL), is presented. The difference with DPL is that the usual DPL semantics is replaced by an error state semantics. This allows for the treatment of unbound anaphors, as in DPL but also of presuppositions and presupposition projection. The use of this dynamic interpretation strategy is demonstrated in an implementation of a small fragment of natural language which handles unbound pronoun antecedent links, where it is assumed that the intended links are indicated in the input string, and uniqueness presuppositions of definite descriptions. The implementation consists of a syntax module which outputs parse trees, a semantic module mapping parse trees to DPL representations, a representation processor which determines truth conditions, falsity conditions and presupposition failure conditions, and an evaluator of these conditions in a database model. The implementation uses the logic programming language GOEDEL, an experimental successor of PROLOG, with similar functionality and expressiveness, but with an improved declarative semantics. ESA

SCHEMA INTEGRATION IN OBJECT-ORIENTED DATABASES
Christiaan J. E. Thieme and Arno P. J. M. Siebes Mar. 1993 33 p
(ISSN 0169-118X)
(CWI-CS-R9320; ETN-94-95433) Copyright Avail: CASI HC A03/MF A01

A formal appproach to support schema integration in object oriented databases is presented. The basis of the approach is a synthetic subclass order, which is defined in terms of a weak subtype relation on underlying types of classes and a subfunction relation on functional forms of methods. Classes are identified using an equivalence relation induced by the subclass order and factorized using a join operator with respect to the subclass order. Class hierarchies are integrated by repeatedly identifying and factorizing classes. Both attributes and methods are used to compare classes and behavior of methods is used to compare attributes. ESA

MODAL LOGIC, TRANSITION SYSTEMS AND PROCESSES
Johan vanBenthem (Amsterdam Univ., Netherlands.), D. Jan N. vanEijck (OTS, Utrecht, Netherlands.), and Vera Stebletsova Mar. 1993 46 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ISSN 0169-118X)
(CWI-CS-R9321; ETN-94-95434) Copyright Avail: CASI HC A03

Transition systems can be viewed either as process diagrams or as Kripke structures. The first perspective is that of process theory, the second that of modal logic. It is shown how formalisms of modal logic can be brought to bear on processes. Notions of bisimulation can not only be motivated by operations on transition systems, but they can also be suggested by investigations of modal formalisms. To show that the equational view of processes from process algebra is closely related to modal logic, various ways of looking at the relation between the calculus of basic process algebra and propositional dynamic logic are considered. Preservation results for various bisimulation notions, a result on the expressive power of propositional dynamic logic, and a definition of bisimulation which is the proper notion of invariance for concurrent propositional dynamic logic are given. SAVING COMPARISONS IN THE CROCHEMORE-PERRIN STRING MATCHING ALGORITHM

Dany Breslauer Mar. 1993 16 p Sponsored in part by IBM Fellowship, and European Research Consortium for Informatics and Mathematics, Netherlands Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9322; ETN-94-95435) Copyright Avail: CASI HC A03

The modification of an algorithm discovered by Crochemore and Perrin, which is a linear time constant space string matching algorithm that makes at most 2n - m symbol comparison, to make fewer comparisons is presented. Given any fixed epsilon greater than zero, the new algorithm takes linear time, uses constant space, and makes at most n + (((1 + epsilon)/2)(n - m)) symbol comparisons. If O(log m) space is available, then the algorithm makes at most n + ((1/2)(n - m)) symbol comparisons. The pattern preprocessing step also takes linear time and uses constant space. These are the first string matching algorithms that make fewer than 2n - m symbol comparisons and use sublinear space. ESA

AN OBJECT MODEL FOR MULTIMEDIA PROGRAMMING

F. Arbab, I. Herman, and G. J. Reynolds Apr. 1993 16 p Submitted for publication Sponsored by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9327; ETN-94-95439) Copyright Avail: CASI HC A03

The development of multimedia applications is a complex task. Much of this complexity stems from requirements associated with programming multiple media objects and the control of dependences and interrelationships between these media objects and the user(s). It is clearly necessary to have a basic framework on which to build multimedia appplications in the face of such complexities. Such a conceptual model, called an object model, is addressed. The MADE (Multimedia Application Development Environment) object model represents a novel approach to multimedia application programming that is founded on the two principal concepts of 'active objects' and 'delegation.' Although these concepts are not novel in themselves, it is believed that their combined use in a multimedia development environment represents a substantial enhancement to more traditional approaches to programming in this area. EFFICIENT MASSIVELY PARALLEL SIMULATION OF DYNAMIC CHANNEL ASSIGNMENT SCHEMES FOR WIRELESS CELLULAR COMMUNICATIONS Final Report

Albert G. Greenberg, Boris D. Lubachevsky, David M. Nicol, and Paul E. Wright Jan. 1994 15 p Submitted for publication
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191593; ICASE-94-3; NAS 1.26:191593) Avail: CASI HC A03/MF A01

Fast, efficient parallel algorithms are presented for discrete event simulations of dynamic channel assignment schemes for wireless cellular communication networks. The driving events are call arrivals and departures, in continuous time, to cells geographically distributed across the service area. A dynamic channel assignment scheme decides which call arrivals to accept, and which channels to allocate to the accepted calls, attempting to minimize call blocking while ensuring co-channel interference is tolerably low. Specifically, the scheme ensures that the same channel is used concurrently at different cells only if the pairwise distances between those cells are sufficiently large. Much of the complexity of the system comes from ensuring this separation. The network is modeled as a system of interacting continuous time automata, each corresponding to a cell. To simulate the model, conservative methods are used; i.e., methods in which no errors occur in the course of the simulation and so no rollback or relaxation is needed. Implemented on a 16K processor MasPar MP-1, an elegant and simple technique provides speedups of about 15 times over an optimized serial simulation running on a high speed workstation. A drawback of this technique, typical of conservative methods, is that processor utilization is rather low. To overcome this, new methods were developed that exploit slackness in event dependencies over short intervals of time, thereby raising the utilization to above 50 percent and the speedup over the optimized serial code to about 120 times. (Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191596; NAS 1.26:191596; ICASE-94-6) Avail: CASI HC A03/MF A01

This paper derives a model of diffuse and specular illumination in arbitrarily large dimensions, based on a few characteristics of material and light in three-space. It then describes how to adjust for the anomaly of excess brightness in large codimensions. If a surface is grooved or furry, it can be illuminated with a hybrid model that incorporates both the one dimensional geometry (the grooves or fur) and the two dimensional geometry (the surface). (NASA-TM-4567; L-17355; NAS 1.15:4567) Avail: CASI HC A03/MF A01

An experimental electronic dissemination project, the Langley Technical Report Server (LTRS), has been undertaken to determine the feasibility of delivering Langley technical reports directly to the desktops of researchers worldwide. During the first six months, over 4700 accesses occurred and over 2400 technical reports were distributed. This usage indicates the high level of interest that researchers have in performing literature searches and retrieving technical reports at their desktops. The initial system was developed with existing resources and technology. The reports are stored as files on an inexpensive UNIX workstation and are accessible over the Internet. This project will serve as a foundation for ongoing projects at other NASA centers that will allow for greater access to NASA technical reports. Author (revised)

SEMANTICS OF MANIFOLD: SPECIFICATION IN ASF+SDF AND EXTENSION

E. P. B. M. Rutten and S. Thiebaux Dec. 1992 106 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9269; ETN-94-95421) Copyright Avail: Issuing Activity (European Space Agency (ESA))

MANIFOLD is a parallel programming language where processes called 'manifolds' use broadcast events to coordinate the dynamic data flow communications among other processes. A specification of the event driven mechanisms of MANIFOLD in the ASF+SDF formalism, and its implementation in the ASF+SDF system, providing automatically a programming environment for MANIFOLD, with syntax directed editor, parser, static checker, and interpreter, are presented. This subset of the language is augmented with a detailed specification of the unit exchange mechanism of the language: the streams, carrying units of data, that compose the data flow networks in MANIFOLD. (CWI-CS-R9270; ETN-94-95422) Copyright Avail: CASI HC A03/MF A01

The increasing number of advanced Data Base Management Systems (DBMS's) offered on the market require tools to quickly assess their performance and to assure their quality. Performance measurement involves running a set of representative workloads, such as benchmarks, and quality assurance, which involves extensive testing. The Software Testpilot described greatly simplifies both jobs by enabling a compact specification of the workload search space, a flexible mechanism to interact with a system under study, and a fast algorithm to expose the performance bottlenecks or software instabilities. A THEORY FOR SIMULATOR TOOLS
Henri P. Korver Jan. 1993 24 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9302; ETN-94-95424) Copyright Avail: CASI HC A03

A possible formalization of the notion simulator tool for process languages like ACP, CCS, (mu)CRL, LOTOS and PSF, is presented. Precise definitions for the notions simulator and simulation are given, and the equivalence that a simulator induces on the explored process terms is investigated. This is done by considering two processes, say p and q, equivalent if each simulation of p is also a simulation of q and vice versa. It is proven that there is no 'reasonable' simulator inducing bisimulation equivalence. It is demonstrated that simulators inducing coarser equivalences, for example ready, failure and trace equivalences, are unlikely to be computationally tractable. The conclusion is that a practical simulator induces an equivalence that is finer (less identifying) than bisimulation and even finer than graph isomorphism. ESA

(Contract ESTEC-9357/91/NL/US) (ISSN 0379-4067)
(ESA-STM-249; ISBN-9-29-092216-8; ETN-94-95456) Copyright Avail: CASI HC A03/MF A01

The purpose of the work is a detailed validation of the new TOPSIM 4 functionalities. The TOPSIM 4 is a system simulator package which needs validation for establishing the reliability of the tool itself. The validation of some selected library blocks covering coding, digital system processing subsystems, and digital filters is presented. Block processing, multirate simulation, and special features intended to enhance the performance of the simulator are taken into account. All the procedures tested showed behavior that was in good agreement with theoretical results, hardware measurements, and results from the literature. The actual version of the simulator is powerful and user friendly for the analysis of design and communication systems. ESA

A MODULAR APPROACH TO EVALUATION CRYPTOGRAPHIC PROTOCOLS USING PETRI NETS M.S. Thesis
Cynthia Mae Morton Jun. 1993 111 p
(ISBN-0-315-85354-9; CTN-94-61105) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

In a methodology used to evaluate the security properties of cryptographic protocols, a protocol is converted to a colored Petri net model with an intruder, capable of intercepting and modifying messages, placed between communicating protocol entities. All reachable model states in a reachability tree are checked to determine whether a path through the tree violates the security properties of the protocol. If a path contains a security violation, then an identifiable flaw has been found in the protocol. A modular approach is developed to simplify the reachability analysis and to reduce the search for security violations. This approach decomposes the Petri net model into component modules, and reachability analysis results from these modules are used to compose the overall reachability analysis results. In conjunction with the module reachability analysis, message acceptance criteria are used to eliminate unsuccessful intruder attacks from the reachability tree. The versatility of the Petri net method is illustrated in the analysis of the authentication and key agreement protocol of the European mobile network GSM, a proposed public key authentication and key distribution protocol and a modified Needham Schroeder key distribution protocol with multiple role entities. The security weaknesses and flaws of these protocols are discussed. Author (CISTI)

PATRAN 2.5/EAL INTERFACE GUIDE
Winifred S. Feldhaus Feb. 1994 49 p
(RTOP 237-02-02-03)
(NASA-TM-109053; NAS 1.15:109053) Avail: CASI HC A03/MF A01

The PATRAN/EA interface guide describes two programs, EALPAT and PATEAL. EALPAT reads an EAL LO1 file and translates the model and results into a PATRAN 2.5 neutral file, element results file, and nodal results file. An EAL model can be color coded in PATRAN, and geometry, loads, boundary conditions, section and material properties, rigid masses, springs, and beam orientations can be plotted and debugged. EAL results can be brought into PATRAN as element or nodal quantities and displayed as deformed plots, animated shapes, color coded elements, or color filled contour plots. PATEAL converts a PATRAN 2.5 data base into an EAL runstream. Geometry, including all element types, alternate coordinate systems, material properties, section properties, loads and boundary conditions are all converted. EALPAT and PATEAL can also be used together with the PATNAS translator from PDA Engineering to convert an EAL runstream to an MSC/NASTRAN bulk data file. Author

HARDWARE AND SOFTWARE RELIABILITY ESTIMATION USING SIMULATIONS
Frederic L. Swern Feb. 1994 160 p
(Grant NAG1-587; RTOP 505-66-21)
(NASA-CR-187588; NAS 1.26:187588) Avail: CASI HC A08/MF A02

The simulation technique is used to explore the validation of both hardware and software. It was concluded that simulation is a viable means for validating both hardware and software and associating a reliability number with each. This is useful in determining the overall probability of system failure of an embedded processor unit, and improving both the code and the hardware where necessary to meet reliability requirements. The methodologies were proved using some simple programs, and simple hardware models. Author

THE PRISM PROJECT: INFRASTRUCTURE AND ALGORITHMS FOR PARALLEL EIGENSOLVERS
C. Bischof, X. Sun, S. Huss-Lederman (Supercomputer Research Center, Bowie, MD.), and A. Tsao (Supercomputer Research Center, Bowie, MD.) 1993 10 p Presented at the Institute of Electrical and Electronic Engineers (IEEE) Meeting on Scalable Parallel Libraries, Starkville, MS, 6-8 Oct. 1993
(Contract W-31-109-eng-38)
(DE94-005125; ANL/MCS/CP-81643; CONF-9310220-4) Avail: CASI HC A02/MF A01

The goal of the PRISM project is the development of the infrastructure and algorithms for the parallel solution of eigenvalue problems. We are currently investigating a complete eigensolver based on the Invariant Subspace Decomposition Algorithm for dense symmetric matrices (SYISDA). After briefly reviewing the SYISDA approach, we discuss the algorithmic highlights of a distributed-memory implementation of an eigensolver based on this approach. These include a fast matrix-matrix multiplication algorithm, a new approach to parallel band reduction and tridiagonalization, and a harness for coordinating the divide-and-conquer parallelism in the problem. We also present performance results of these kernels as well as the overall SYISDA implementation on the Intel Touchstone Delta prototype and the IBM SP/1. DOE

INVERTED PENDULUM CONTROL APPARATUS USING TRANSPUTERS
Shinji Inomata (Japan Atomic Energy Research Inst., Tokai.) and Katuo Suzuki (Japan Atomic Energy Research Inst., Tokai.) Jun. 1993 50 p In JAPANESE; In JAPANESE
(DE94-701224; JAERI-M-93-119) Avail: CASI HC A03/MF A01

An inverted pendulum control apparatus is is controlled by a personal computer with transputer, analog-to-digital converter (A/D), and digital-to-analog converter (D/A) boards. For the apparatus, it is necessary to shorten the program processing time for input of data by A/D and output of calculation results by D/A. In order to implement control algorithms, we investigated three programming methods for interfacing between the transputer and A/D or D/A converters: (1) by expanding I/O server, (2) by port-accessing using I/O server, and (3) without use of I/O server. Each programming method is evaluated from the view point of their applicability to the inverted pendulum control which requires millisecond-order response. It is concluded that for the inverted pendulum control experiment the first method is the most suitable one because of the advantages of short processing time and easy programming of control algorithm in spite of the complexity of interface programming. These advantages are also confirmed by the control experiment. DOE

A STRANGE APPLICATION OF KOLMOGOROV COMPLEXITY
Alexander Shen (Institute for Problems of Information Transmission, Moscow, USSR.) Apr. 1993 7 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9328; ETN-94-95440) Copyright Avail: CASI HC A02

Two similar inequalities are addressed: 2K((A, B, C)) is less than or equal to K((A, B)) + K((A, C)) + K((B, C)) + O(log n) and 2KP((A, B, C)) is less than or equal to KP((A, B)) + KP((A, C)) + KP ((B, C)) + O(1), where K denotes simple Kolmogorov entropy and KP denotes prefix entropy. It turns out from the first inequality that the following well known geometric fact can be inferred: the (absolute value of v) squared is less than or equal to the absolute value of S(sub xy) times the absolute value of S(sub yz) times the absolute value of S(sub xz), where V is a set in three dimensional space, S(sub xy), S(sub yz), S(sub xz) are its three two dimensional projections, and the absolute value of W is the volume (or the area) of W. The second inequality is a corollary of the well known Cauchy-Schwarz inequality. The connection between geometry and Kolmogorov complexity therefore works in both directions. ESA

MODULATION SIMULATION PROGRAM: PROGRAMMER'S MANUAL, VERSION 1.00
Kenneth Lazaris-Brunner 16 Oct. 1990 45 p
(Contract DSS-W7714-0-9883)
(DREO-16; DSIS-94-00051; CTN-94-61121) Copyright Avail: CASI HC A03/MF A01

A programmer manual is presented for software developed to digitally simulate various types of modulations, both analog and digital, of interest in the field of modulation identification and recognition. The software can simulate amplitude, frequency, and single and double sideband suppressed carrier modulation, plus amplitude shift keying, phase shift keying (binary, quadrature, and offset quadrature), frequency shift keying, on-off keying, and continuous wave plus noise. For each simulation, the user can select the modulator parameters or let the program randomly select them within user-defined limits. The software can also automatically generate as many files as desired without requiring any operator intervention. This feature is useful for creating a large data bank of signals. Author (CISTI)

ACES SPECTRAL DISPLAY SOFTWARE: USER MANUAL
30 Apr. 1992 17 p Revised
(Contract DREO-W7714-1-0007)
(SKL-1600-99-002; DSIS-94-00056; CTN-94-61123) Avail: CASI HC A03/MF A01

The user interface to the prototype Advanced Communications Electronic Support Measures System spectral display software is described. The

software provides the user with a real-time spectral display of a portion of the radio frequency spectrum based on signal data produced by a high speed digital signal processor. The prototype system is based on a 80486 personal computer and the software was developed using Microsoft C version 6.0. After program startup, the user specifies whether a two- or three-dimensional display is required, then enters the sampling frequency and the minimum and maximum signal strength. The resulting spectral display is then shown on a high resolution monitor. A list of software source files and their contents is appended, along with a procedure for compiling and linking the source files and modifying the software to change the color pallet, scrolling of data, and display size and location.

SIMULATING FAIL-STOP IN ASYNCHRONOUS DISTRIBUTED SYSTEMS
Laura Sabel and Keith Marzullo Mar. 1994 26 p Sponsored by DARPA, IBM, and Siemens
(Grant NAG2-593)
(NASA-CR-195698; NAS 1.26:195698; TR-94-1413) Avail: CASI HC A03/MF A01

The fail-stop failure model appears frequently in the distributed systems literature. However, in an asynchronous distributed system, the fail-stop model cannot be implemented. In particular, it is impossible to reliably detect crash failures in an asynchronous system. In this paper, we show that it is possible to specify and implement a failure model that is indistinguishable from the fail-stop model from the point of view of any process within an asynchronous system. We give necessary conditions for a failure model to be indistinguishable from the fail-stop model, and derive lower bounds on the amount of process replication needed to implement such a failure model. We present a simple one-round protocol for implementing one such failure model, which we call simulated fail-stop.

ARM: ABSTRACT REWRITING MACHINE
J. F. T. Kamperman and H. R. Walters Apr. 1993 26 p Sponsored in part by EEC
(ISSN 0169-118X)
(CWI-CS-R9330; ETN-94-95441) Copyright Avail: CASI HC A03/MF A01

Term rewriting is frequently used as an implementation technique for algebraic specifications. The Abstract Term Rewriting Machine (ARM), which has an extremely compact instruction set and imposes no restrictions on the implemented TRS's, is presented. Apart from standard conditional term rewriting, associative lists are supported. ARM code is translated to ANSI C; the resulting execution speeds are good: on a Sun 4, an average of 80,000 rewriting steps per second and a maximum of 416,000 r/s were measured. Several benchmarks are shown, and related work is discussed.

A THEORY OF MULTI-SCALE, CURVATURE AND TORSION BASED SHAPE REPRESENTATION FOR PLANAR AND SPACE CURVES Ph.D. Thesis
Farzin Mokhtarian Oct. 1990 184 p
(ISBN-0-315-63894-X; CTN-94-60996) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A theory of shape representation for planar and space curves was developed to satisfy various criteria considered useful for evaluating shape representation methods in computer vision. Two regular representations and two variants are proposed. Experiments were carried out on the representations which show that they are very stable under severe noise conditions and very useful for tasks which call for recognition of a noisy curve of arbitrary shape at an arbitrary scale or orientation. Planar or space curves are described at varying levels of detail by convolving their parametric representations with Gaussian functions of varying standard deviations. The curvature or torsion of each such curve is then computed using equations expressing curvature and torsion in terms of the convolutions of derivatives of Gaussian functions and parametric representations of the input curves. Curvature or torsion zero crossing points of those curves are then located and combined to form one of the representations mentioned. A number of theorems about describing a curve at increasing levels of abstraction are presented to provide a sound theoretical foundation for the representation methods proposed.

SMALLTALK: A TOOL FOR DEVELOPMENT OF AN Ada IMPLEMENTATION OF EWCAC
I. Graham 6 Dec. 1988 26 p Submitted for publication
(SKL-1600-46-003-01-0; DSIS-94-00054; CTN-94-61125) Avail: CASI HC A03

The Electronic Warfare Control and Analysis Centre (EWCAC) will support tactical electronic warfare units in their intercept, collection, and analysis tasks. The EWCAC system will be implemented in the Ada language in accordance with requirements. A preliminary EWCAC design has already been done, and prototyping techniques may be used during the design phase to allow ongoing verification. For prototyping to be cost-effective, it is important to ensure that a suitable programming language be used. The use of Smalltalk and its environment as a tool to aid in EWCAC development is examined. Smalltalk is compared to Ada in order to identify the strengths of each language. The EWCAC development process is then studied and the usefulness of Smalltalk during each phase is assessed. It is concluded that Smalltalk would be a valuable tool in a number of areas including EWCAC simulation, contracting, design, prototyping, training, and future support. Of special importance is the reusability, at each stage, of Smalltalk software developed in previous stages. The flexibility of Smalltalk would also be advantageous in easing each phase of EWCAC development.

RANKING ALTERNATIVES USING FUZZY NUMBERS: A COMPUTATIONAL APPROACH SHORT COMMUNICATION
Oscar Pereira Dias, Jr. 1993 11 p
(INPE-5483-PRE/1782) Avail: CASI HC A03/MF A01

The method presented for ranking alternatives by using fuzzy numbers is discussed as far as computational aspects are concerned. An alternative procedure is presented which allows for the use of any convex and normalized fuzzy set to assess the contribution of each alternative to some of the criteria. The procedure also allows the criteria to be structured in n-level hierarchies. An example is presented to illustrate the algorithm.

A research project was established to address deficiencies in off-the-shelf tools used to help automate source file management. The background work necessary to initiate the research project is provided, along with general guidelines for future research activities. The type of tool which is considered can be labelled as a software engineering environment (SEE) or an integrated project support environment (IPSE). This SEE uses a process programming language to define the software engineering process to be enforced. A process is modelled as a set of activities which must occur according to a predetermined sequence. An event-driven approach is used to determine the sequencing of activities. The completion of an activity is an example of an event which can be used. Whenever an event occurs, the SEE determines what activity, if any, must be released next and then assigns them to users. A user performs software engineering work through the activities found in this activity list. The user is presented with a list of options whenever an activity is selected from that list. Selecting an option invokes a software tool which in turn performs a subactivity required to fulfill the parent activity. The requirements and the design of the first prototype of the SEE is presented. A simple process programming language is also introduced and evaluation issues are discussed.

Using stereo vision to compute depth, stereo correspondence between points in left and right images can be reliably achieved only at points of intensity changes. Due to the need for computing depth at every point in the image, interpolation of this sparse depth data becomes necessary. A class of interpolants known as Shepard's surfaces is shown to satisfy the required constraints on interpolation. Shepard's interpolants were implemented and results from testing on random dot stereograms show that stereo vision can function alone without any additional visual cues. Even when intensity changes are sparse, the reconstruction preserves the shape of the natural stereo pair. Besides depth from stereopsis, shape information also becomes important in reconstructing the surface. An important shape cue is provided by shading. A method is proposed to compute relative depth, normals, and principal curvatures of a surface, involving minimization of a global objective function formulated by imposing certain constraints. The principal curvatures are shown computable from the shape descriptor used. It is also shown that depth information at an arbitrary set of points can be included as additional set constraints in the shape computing algorithm, and any known set of normals can be used to improve the convergence of the shape from shading algorithm.

A formal approach in order to compare information systems development methods is presented. For each of the methods, a formal representation of it is constructed as a metaprocess model and a metadata model. The metamodels represent the steps of the analysis and design, the concepts, and the techniques provided by this method. The six methods are compared and the results are given. The implications of the transition to object oriented methods for the systems development practice and its CASE (computer aided systems engineering) tool support are presented. For individual titles, see N94-27937 through N94-27939.

Object oriented analysis and design methods are introduced. In contrast with the traditional Structured Analysis/Structured Design (SA/SD) approach, the object oriented paradigm describes and designs systems as much as possible as they occur in the real world. The background and concepts are overviewed. Results of comparative studies of object oriented methods are described. The relation between these methods and some object oriented programming languages is outlined. These methods are difficult to implement in a traditional programming language with maintenance of their advantages.

Six Object Oriented Analysis and Design Methods (OOADM's) are compared by metamodeling. Metadata models of the development data and metaprocess models of the methods steps are obtained. CASE (Computer Aided Systems Engineering) tools were applied. Three scenarios for the adoption of OOADM's are discussed: the singular scenario that is chosen for one method; the synthetic scenario that tries to integrate OO analysis and design techniques into the more conventional approaches; and the open scenario that supports as many different OO techniques as possible. The transition of OO analysis and design products to OO programming environments and OO database management systems is considered.

SOFTWARE ASSURANCE STANDARD
10 Nov. 1992 25 p
(NASA-TM-109705; NAS 1.15:109705; NASA-STD-2201-93) Avail: CASI HC A03/MF A01

This standard specifies the software assurance program for the provider of software. It also delineates the assurance activities for the provider and the assurance data that are to be furnished by the provider to the acquirer. In any software development effort, the provider is the entity or individual that actually designs, develops, and implements the software product, while the acquirer is the entity or individual who specifies the requirements and accepts the resulting products. This standard specifies at a high level an overall software assurance program for software developed for and by NASA. Assurance includes the disciplines of quality assurance, quality engineering, verification and validation, nonconformance reporting and corrective action, safety assurance, and security assurance. The application of these disciplines during a software development life cycle is called software assurance. Subsequent lower-level standards will specify the specific processes within these disciplines. Derived from text

PARAMETER ESTIMATION OF LINEAR SYSTEMS FROM FREQUENCY RESPONSE MEASUREMENTS (COMPUTER PROGRAM)
Jul. 1993 24 p
(ISSN 0141-3988)
(ESDU-93016; ISBN-0-85679-868-1) Avail: ESDU

ESDU 93016 introduces a Fortran program that implements the method of ESDU 90006 but modified to take into account the residual gain and phase variation effects of modes whose resonant frequencies lie outside the range of analysis. The system is modeled as a set of lightly-damped coupled second order differential equations with constant coefficients; the response determined from those equations is equivalent to the sum of the responses of a related set of single degree-of-freedom systems. The program requires initial estimates of the resonant frequency of each response mode together with an associated frequency range and they are obtained from a visual inspection of the Nyquist or Bode diagram of the measurement data. From those initial values, the program determines the damping ratio of the modes. These values provide a starting point for a nonlinear parameter estimation procedure using a Newton-Gauss algorithm from which the mode characteristics that satisfy the complete measurement data are found. The program will handle up to 3000 measurement points and nine separate response modes. Examples illustrate the use of the program for systems with two and four degrees-of-freedom, and show clearly the input format required and the output provided. The program is available on disc (uncompiled) in the software volume as ESDUpac A9316. ESDU

(PB94-132859; TKO-B103) Avail: CASI HC A03/MF A01

ActorStudio is a graphical, interactive user interface editor targeted for creating application specific interaction techniques. These techniques can be defined on different abstraction levels. ActorStudio offers components that define the basic and the reactive appearances, and the behavior of the user interface. The components in turn can be joined into sophisticated hierarchies describing complicated user interfaces. As result from editing actions, ActorStudio produces a description of a developed user interface in a language called Screenplay. ActorStudio has been implemented for Macintoshes using Common Lisp and CLOS. It also uses an object oriented toolkit called WimperActors developed in Helsinki University of Technology. NTIS

Specific requirements for communication in manufacturing are discussed. The benefits of standardization of communication protocols are analyzed. The guidelines for protocol layering defined in the Open System Interconnection (OSI) reference model of the International Organization for Standardization (ISO) are presented. The historical backgrounds and the status of the Manufacturing Automation Protocol/Technical and Office Protocol (MAP/TOP) and the so-called field bus process are analyzed. Important application layer OSI protocols for manufacturing are discussed: Directory Services, Network Management, File Transfer and Access Management (FTAM) and Manufacturing Message Specification (MMS). The MMS service sets, services and protocol are described. The MAP implementation classes and ISO/IEC (International Electrotechnical Commission) MMS Companion Standards are viewed. The MAP/TOP product markets and installations are analyzed. It is highly probable that the use of OSI/MAP/TOP and particularly MMS products will increase and the market share will grow. NTIS

USING A TRANSFER FUNCTION TO DESCRIBE THE LOAD-BALANCING PROBLEM
A. J. Conley Nov. 1993 5 p
(Contract W-31-109-eng-38)
(DE94-004218; ANL-93/40) Avail: CASI HC A01/MF A01

The dynamic load-balancing problem for mesh-connected parallel computers can be clearly described by introducing a function that identifies how much work is to be transmitted between neighboring processors. This function is a solution to an elliptic problem for which a wealth of knowledge exists. The nonuniqueness of the solution to the load-balancing problem is made explicit. DOE

A NUMERICAL STUDY OF HIGH-SPEED MISSILE CONFIGURATIONS USING A BLOCK-STRUCTURED PARALLEL ALGORITHM M.S. Thesis
Douglas C. Blake Dec. 1993 119 p
(AD-A273776; AFIT/GAE/ENY/93D-4) Avail: CASI HC A06/MF A02

A numerical analysis of the aerodynamic phenomena associated with the high speed flight of a sharp-nosed, four-finned, high fineness ratio missile using a block-structured, parallel computer algorithm is presented. The algorithm, PANS-3EM, utilizes a second order accurate, shock-capturing, total variation diminishing scheme and incorporates a Baldwin-Lomax turbulence model. PANS-3EM allows for extreme flexibility in the choice of computational domain decomposition and computing machine of implementation. Developmental work consists of conceptualization and verification of the algorithm as well as parallel performance and scalability studies conducted on a variety of computing platforms. Using PANS-3EM, the aerodynamic characteristics of the missile are investigated. Drag and pitching moment coefficients are computed and compared against experimental flight data. Trends in the numerical data agree with experimental results with the exception that an unexpected reversal of the stability characteristics exhibited by the missile at speeds in excess of Mach 3.75 are not confirmed by the computer code. OBJECT-ORIENTED DESIGN AND IMPLEMENTATION OF A PARALLEL Ada SIMULATION SYSTEM M.S. Thesis
James T. Belford Nov. 1993 113 p
(AD-A274119; AFIT/GCE/Eng/93D-01) Avail: CASI HC A06/MF A02

Simulations which model the behavior 'real world' entities are often large and complex, and require frequent changes to the configuration. This research effort examines the benefits of using object-oriented techniques to develop a distributed simulation environment which supports modularity, modifiability, and portability. The components of the Parallel Discrete Event Simulation (PDES) environment are identified and modeled using the Rumbaugh modeling technique. From the model, a prototype implementation of a Parallel Ada Simulation Environment (PASE) is accomplished using Classic Ada. A system interface for the Intel ipsc/2 Hypercube was developed to illustrate the concepts of modularity and portability. In addition, the prototype environment uses a filter which implements the basic Chandy-Misra time synchronization protocol. Finally, to test the correct operation of the environment, a simple battlefield application model is developed. PASE is tested in the sequential mode on both a Sun Sparc station and the Hypercube. The ability to distribute across n-nodes is demonstrated using various configurations on the Hypercube. The parallel test demonstrates the ability for objects on separate processors to interact with each other by passing messages, and to execute events generated by remote objects in the proper time stamp order. USE OF PARALLEL COUNTERS FOR TRIGGERING
N. M. Nikityuk 1991 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616656; JINR-E-10-91-567) Avail: CASI HC A03 (US Sales Only)

Results of investigation of using parallel counters, majority coincidence schemes, parallel compressors for triggering in multichannel high energy spectrometers are described. Concrete examples of methods of constructing fast and economic new devices used to determine multiplicity hits t greater than 900 registered in a hodoscopic plane and a pixel detector are given. For this purpose the author uses the syndrome coding method and cellular arrays. In addition, an effective coding matrix has been created which can be used for light signal coding. For example, such signals are supplied from scintillators to photomultipliers. DOE

OUT OF CORE, OUT OF MIND: PRACTICAL PARALLEL I/O
D. E. Womble, D. S. Greenberg, R. E. Riesen, and S. R. Wheat 1993 7 p Presented at the Institute of Electrical and Electronic Engineers (IEEE) Meeting on Scalable Parallel Libraries, Starkville, MS, 6-8 Oct. 1993
(Contract DE-AC04-94AL-85000)
(DE94-003107; SAND-93-2595C; CONF-9310220-2) Avail: CASI HC A02/MF A01

Parallel computers are becoming more powerful and more complex in response to the demand for computing power by scientists and engineers. Inevitably, new and more complex I/O systems will be developed for these systems. In particular we believe that the I/O system must provide the programmer with the ability to explicitly manage storage, despite the trend toward complex parallel file systems and caching schemes. One method of doing so is to have a partitioned secondary storage in which each processor owns a logical disk. Along with operating system enhancements which allow overheads such as buffer copying to be avoided and libraries to support optimal remapping of data, this sort of I/O system meets the needs of high performance computing. DOE

ACHIEVING HIGH PERFORMANCE ON THE INTEL PARAGON
D. S. Greenberg, B. Maccabe, R. Riesen, S. Wheat, and D. Womble 1993 6 p Presented at the Intel Super Computer Users Group Meeting, St. Louis, MO, 4 Oct. 1993
(Contract DE-AC04-94AL-85000)
(DE94-003108; SAND-93-2597C; CONF-9310232-1) Avail: CASI HC A02/MF A01

When presented with a new supercomputer most users will first ask 'How much faster will my applications run?' and then add a fearful 'How much effort will it take me to convert to the new machine?' This paper describes some lessons learned at Sandia while asking these questions about the new 1800+ node Intel Paragon. The authors conclude that the operating system is crucial to both achieving high performance and allowing easy conversion from previous parallel implementations to a new machine. Using the Sandia/UNM Operating System (SUNMOS) they were able to port a LU factorization of dense matrices from the nCUBE2 to the Paragon and achieve 92% scaled speed-up on 1024 nodes. Thus on a 44,000 by 44,000 matrix which had required over 10 hours on the previous machine, they completed in less than 1/2 hour at a rate of over 40 GFLOPS. Two keys to achieving such high performance were the small size of SUNMOS (less than 256 kbytes) and the ability to send large messages with very low overhead. DOE

REAL-TIME TRACKING WITH A 3D-FLOW PROCESSOR ARRAY
D. Crosetto Jun. 1993 5 p Presented at the Workshop on B Physics At Hadron Colliders, Snowmass, CO, 21 Jun. - 2 Jul. 1993 Submitted for publication
(Contract DE-AC35-89ER-40486)
(DE94-003981; SSCL-Preprint-516; CONF-9306258-14) Avail: CASI HC A01/MF A01

The problem of real-time track-finding was performed to date with CAM (Content Addressable Memories) or with fast coincidence logic, because the processing scheme was thought to have much slower performance. Advances in technology together with a new architectural approach make it feasible to also explore the computing technique for real-time track finding thus giving the advantages of implementing algorithms that can find more parameters such as calculate the sagitta, curvature, pt, etc., with respect to the CAM approach. Real-time track finding using new computing approach technique based on the 3D-Flow array processor system was described. This system consists of a fixed interconnection architecture scheme, allowing flexible algorithm implementation on a scalable platform. The 3D-Flow parallel processing system for track finding is scalable in size and performance by either increasing the number of processors, or increasing the speed or else the number of pipelined stages. The conceptual idea and the design stage of the project are described. DOE

A VHDL REGISTER TRANSFER LEVEL MODEL OF THE LINEAR TOKEN PASSING MULTIPLEX DATA BUS PROTOCOL FOR THE HIGH SPEED DATA BUS Interim Report, 1 Jun. 1992 - 15 Jul. 1993
Jerry A. Myers Sep. 1993 74 p
(AF Proj. 2003)
(AD-A273734; WL-TR-93-1125) Avail: CASI HC A04/MF A01

The research project abstract presented will describe the design process to develop a partial simulatable specification model written in VHDL at the register transfer level to describe the linear token passing multiplex data bus protocol ('PROTOCOL') specification. The PROTOCOL is a distributed token passing computer protocol which operates over a dual redundant bus. The PROTOCOL is used as the communications standard to implement the high speed data bus (HSDB) module specification. The PROTOCOL and HSDB specifications are two of the pave pillar avionics architecture bus specifications being developed for the F-22, LHX, and future military aircraft. While this model does not implement the entire HSDB protocol specification, it does implement enough of the referenced specifications to give credence to the concept of hardware simulation modeling of avionics specifications. This concept is applicable for both military and commercial applications written in the VHDL language at a specification level of detail. DTIC

RUN-TIME RECOGNITION OF TASK PARALLELISM WITHIN THE P++ PARALLEL ARRAY CLASS LIBRARY
R. Parsons and D. Quinlan 1993 11 p Presented at the Institute of Electrical and Electronic Engineers (IEEE) Meeting on Scalable Parallel Libraries, Starkville, MS, 6-8 Oct. 1993
(Contract W-7405-eng-36)
(DE94-002707; LA-UR-93-3856; CONF-9310220-1) Avail: CASI HC A03/MF A01

The use of a run-time system to recognize task parallelism with a C++ array class library was explored. Run-time systems currently support data parallelism in P++, FORTRAN 90 D, and High Performance FORTRAN. But data parallelism is insufficient for many applications, including adaptive mesh refinement. Without access to both data and task parallelism, such applications exhibit several orders of magnitude more message passing and poor performance. A C++ array class library is used to implement deferred evaluation and run-time dependence for task parallelism recognition, to obtain task parallelism through a data flow interpretation of data parallel array statements. Performance results show that analysis and optimizations are both efficient and practical, allowing us to consider more substantial optimizations. DOE

N94-26473 Sandia National Labs., Albuquerque, NM.
A DOUBLY LOGARITHMIC COMMUNICATION ALGORITHM FOR THE COMPLETELY CONNECTED OPTICAL COMMUNICATION PARALLEL COMPUTER
L. A. Goldberg, M. Jerrum (Edinburgh Univ., Scotland.), T. Leighton (Massachusetts Inst. of Tech., Cambridge.), and S. Rao (NEC Research Inst., Princeton, NJ.) 20 Jan. 1993 19 p Presented at the 5th Annual Association for Computing Machinery on Parallel Algorithms and Architectures, Velen, Germany Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract DE-AC04-76DP-00789)
(DE93-019408; SAND-93-0205C; CONF-9306220-1) Avail: Issuing Activity (Department of Energy (DOE))

In this paper we consider the problem of interprocessor communication on a Completely Connected Optical Communication Parallel Computer (OCPC). The problem in question is that of realizing an h-relation. In this problem, each processor has at most h messages to send and at most h messages to receive. It is clear that any 1-relation can be realized in one communication step on an OCPC. However, the best known p-processor OCPC algorithm for realizing an arbitrary h-relation for h greater than 1 requires theta(h + log p) expected communication steps. The algorithm is optimal only for h = omega(log p) and it is an open question as to whether or not there is a faster algorithm for h = o(log p). In this paper we answer this question in the affirmative by presenting a theta(h + log log p) communication step algorithm that realizes an arbitrary h-relation on a p-processor OCPC. We show that if h is less than or equal to (log p), then the failure probability can be made as small as p(sup -(alpha)) for any positive constant alpha. DOE

PARALLEL COMPUTATIONAL GEOMETRY ON ANALOG HOPFIELD NETWORKS M.S. Thesis
Natana Valiveti 23 Nov. 1992 140 p
(ISBN-0-315-84093-5; CTN-94-61051) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A novel approach to solving computational geometry problems in parallel is presented, using analog Hopfield neural networks. The use of massively parallel analog networks requires a radically different approach to geometric problem solving because time is continuous and geometric data are represented by analog components. Analog network algorithms are presented for the following geometrical problems: minimum weight triangulation of planar point sets or of polygons with holes; finding the smallest E so that two given point sets are E-congruent via translation; and partition of a set of points into K clusters such that the maximum diameter of the clusters is minimized. An improvement is also given to Hopfield's solution for the Euclidean travelling salesman problem. For each network, the network's parameters are analyzed in detail and it is proven that the networks indeed produce feasible solutions. Experimental results demonstrate the performance of the analog Hopfield neural networks. CISTI

It is proposed to create a test bed to ease algorithm and hardware development tasks. The advances in very large scale integration have created a situation in which complex signal processing algorithms are considered even for high speed, high computational complexity applications. For these applications for which only an incomplete analytical performance evaluation can be made, the problem of signal processing algorithm verification becomes a bottleneck in both research and development stages. A programmable hardware algorithm evaluation system capable of operating at or near real-time for the data rates of interest is required. A multiprocessor system based on a slotted ring bus communication scheme has been adopted as a compromise between interconnection bus complexity and bus transfer efficiency. A review of selected digital signal processing (DSP) system algorithms has been used to verify the design choices. The hardware has been implemented on the TMS320C30 microprocessor and tested, and benchmark results are given. The test bed discussed can serve for testing complex DSP algorithms. The speedup in evaluation time creates for the user a nearly final-product testing situation, providing results at or near real time. Author (CISTI)

This report describes the design and implementation of a 16 node multitransputer parallel processing system (MTPPS) which is a platform for parallel program development. It is a MIMD machine based on message passing paradigm. The basic compute engine is an Inmos Transputer Ims T800-20. Transputer with local memory constitutes the processing element (node) of this MIMD architecture. Multiple nodes can be connected to each other in an identifiable network topology through the high speed serial links of the transputer. A network configuration unit (NCU) incorporates the necessary hardware to provide software controlled network configuration. System is modularly expandable and more nodes can be added to the system to achieve the required processing power. The system is back-end to the IBM-PC which has been integrated into the system to provide user I/O interface. PC resources are available to the programmer. Interface hardware between the PC and the network of transputers is INMOS compatible. Therefore, all the commercially available development software compatible to INMOS products can run on this system. While giving the details of design and implementation, this report briefly summarizes MIMD architectures, transputer architecture, and parallel processing software development issues. LINPACK performance evaluation of the system and solutions of neutron physics and plasma physics problem have been discussed along with results. DOE

PARSING SCHEMATA: A FRAMEWORK FOR PARALLEL AND SEQUENTIAL PARSING
Klaas Sikkel May 1993 103 p See also PB93-211118
(PB94-125267; Memo-INF-93-28) Avail: CASI HC A06/MF A02

A parsing schema is an abstract specification of a parser. It can be seen as a generalization of a chart parser for context-free languages. A parsing system for a particular grammar and string is a logical deduction system. It consists of a domain of items, an initial set of items, and rules that allow one to deduce new items from already known ones. A parsing schema yields a parsing system for any given grammar and input string. Two types of operations on parsing schemata are treated extensively. A schema can be refined into another schema by making smaller deduction steps and storing the intermediate results. A schema can be filtered by discarding items and deduction steps that cannot contribute to the construction of a valid parse. Filtering is particularly useful for sequential implementations. This paper has a dual purpose. On the one hand, the theoretical foundations of parsing schemata and relations between schemata are worked out. On the other hand, by giving a range of nontrivial examples, we show that the approach can successfully be used to define, compare, and improve practical parsers. NTIS

INTERACTIVE CONTROL OF A PARALLEL SIMULATION FROM A REMOTE GRAPHICS WORKSTATION M.S. Thesis
Douglas C. Looney 14 Dec. 1993 82 p
(AD-A274217; AFIT/GCE/Eng/93D-9) Avail: CASI HC A05/MF A01

Modern military commanders are faced with an overwhelming amount of intelligence data concerning the disposition of engaging forces. The sheer volume of data produced for a single planning scenario is an obstacle to the user as well as the computer. Today's commander requires a real-time, three-dimensional representation of the battlefield in order to assimilate the data for the management of a conflict. Parallel computation is required to complete the processing of this information in a timely manner. The improvement of user interaction through graphical representation of a parallel simulation is the purpose of this study. The requirements for the user's control commands and the effect of these requirements upon the entire system are developed and demonstrated. This research provides an increased capability to assist in battlefield management and critical decision making processes. DTIC

Sisal is a general-purpose functional language that hides the complexity of parallel processing, expedites parallel program development, and guarantees determinacy. Parallelism and management of concurrent tasks are realized automatically by the compiler and runtime system. Spatial domain decomposition is a widely-used method that focuses computational resources on the most active, or important, areas of a domain. Many complex programming issues are introduced in paralleling this method including the following: dynamic spatial refinement, dynamic grid partitioning and fusion, task distribution, data distribution, and load balancing. In this paper, we describe a spatial domain decomposition algorithm programmed in Sisal. We explain the compilation process, and present the execution performance of the resultant code on two different multiprocessor systems: a multiprocessor vector supercomputer, and cache-coherent scalar multiprocessor. (AD-A274204; RL-TR-93-158) Avail: CASI HC A03/MF A01

In the sequential world, the mapping of processes to a computer system was not a problem because of the classic Von Newman architecture. However, in the parallel world, the mapping of processes to nodes and the balancing of the load on each node becomes an issue that needs to be addressed. This problem enters software development in the implementation phase and remains an issue through the testing and system integration phases. This report describes a new method developed to improve the mapping on a hypercube system. This new hypersphere mapping approach performs an optimal mapping based on the geometry of the physical system and the communication patterns of the processes. The hypersphere mapper can map processes to nodes where the number of processes exceeds the number of nodes. Other mapping approaches rely on heuristics to cluster the communication graphs into subgraphs to accomplish this mapping. The hypersphere mapper can be instrumental in the implementation phase of software development by specifying an optimal mapping that will improve the performance of the system. This method also provides a transparent programming environment, where the programmer does not need to know about the interconnection network of the physical computer system. The hypersphere mapper was tested using simulated directed and undirected random communication graphs. DTIC

AUTOMATIC MAPPING OF TASK AND DATA PARALLEL PROGRAMS FOR EFFICIENT EXECUTION ON MULTICOMPUTERS
Jaspal Subhlok Nov. 1993 17 p
(Contract MDA972-90-C-0035; ARPA Order 7330)
(AD-A274125; CMU-CS-93-212) Avail: CASI HC A03/MF A01

For a wide variety of applications, both task and data parallelism must be exploited to achieve the best possible performance on a multicomputer. Recent research has underlined the importance of exploiting task and data parallelism in a single complier framework, and such a complier can map a single source program in many different ways onto a parallel machine. There are several complex trade offs between task and data parallelism, depending on the characteristics of the program to be executed and the performance parameters of the target parallel machine. This makes it very difficult for a programmer to select a good mapping for a task and data parallel program. In this paper we isolate and examine specific characteristics of executing programs that determine the performance for different mappings on a parallel machine, and present an automatic system to obtain good mappings. The process consists of two steps: First, an instrumented input program is executed a fixed number of times with different mappings, to build an execution model of the program. Next, the model is analyzed to obtain a good final mapping of the program on to the processors of the parallel machine. DTIC

DESIGN OF A PARALLEL DISCRETE EVENT SIMULATION COPROCESSOR M.S. Thesis
Jacob L. Berlin Dec. 1993 132 p
(AD-A274135; AFIT/GCS/Eng/93D-02) Avail: CASI HC A07/MF A02

A Parallel Discrete Event Simulation Coprocessor was designed to off-load the synchronization overhead from the processors executing the application. In a multiprocessor architecture, one coprocessor executes the synchronization routines for each host processor. Speedup can be achieved when the host processor executes the application and the coprocessor concurrently executes synchronization routines. The coprocessor uses a programmable microcode control store to guarantee flexibility in the synchronization routines. The coprocessor uses an Extreme Search Associative Memory to support fast Next Event Queue (NEQ) management. This associative memory uses bit-serial word-parallel search logic to provide 0(1) insert and retrieval time of events in the NEQ. The coprocessor was completely described in the VHSIC Hardware Description Language (VHDL), and several components were fabricated and tested. Timing measurements of the fabricated components were back-annotated into the VHDL description to improve model accuracy. Synchronization overhead of a parallel VHDL simulation was measured using the AFIT Algorithm Animation Research Facility, and this data was used for a conceptual performance analysis of the coprocessor. A four-fold speedup was achieved for the NEQ management of the simulation; however, the total speedup was only 1.02 since less than 2% of the application was accelerated. DTIC

GARBAGE COLLECTION IN A MULTIPROCESSOR SMALLTALK SYSTEM Ph.D. Thesis
John Duimovich 12 Jan. 1989 112 p
(ISBN-0-315-51159-1; CTN-94-60980) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

In modern programming systems, dynamic memory allocation and deallocation is provided through the use of system primitives. The responsibility for the use of these is left wholly up to the programmer. To ease this burden, some systems such as Smalltalk provide automatic storage reclamation mechanisms known as garbage collection. With the increasing attractiveness of multiprocessor systems, projects such as Multiprocessor Smalltalk require high performance multiprocessor garbage collection strategies optimized for the system in question. A multiprocessor garbage collection algorithm is presented for use in Actra, a multiprocessor Smalltalk system. The algorithm uses entry tables to determine interprocessor object reachability. The use of tables reduces interprocessor synchronization requirements, allowing processors to garbage collect independently. This technique differs from other multiprocessor algorithms which require that all processors stop during garbage collection. A prototype of this collector has been implemented and is described. The problem of permuting n data items, each covering D global memory cells, on an EREW PRAM with n/(log n) processors and less than Dn additional storage is investigated. A family of algorithms (A(sub k))(sub k), where k = 1, 2, ..., log* n, such that A(sub k) needs time Dlog nlog(sup k)n, is presented. Here, log(sup k)n, denotes k times application of log to n, and log* n = min(k such that log(sup k)n less than or equal to 1). All algorithms need Theta(n) operations, which is optimal. The storage requirements for A(sub k) are n global bits, n/log(sup k - 1)n global memory cells if k is greater than or equal to 2, and Dlog n/log(sup k - 1)n (respectively D) local memory cells per processor if k is greater than or equal to 2 (respectively k = 1). The family A(sub k) hence reveals a time-space tradeoff. The result can be generalized to machines with p less n/log n processors such that the run time is (Dn/p)log(sup k)n, (Dn/p)/log(sup k - 1)n local cells per processor are needed, and the global storage requirements remain as given above. Efficient solution of the consistent (unambiguous) labeling problem has applications in fields including image processing, computer vision, graph theory, cryptography, and other areas which can be posed as constraint satisfaction problems. It was shown that the labeling problem is inherently suited to implementation on parallel architectures. It is suggested that the unique aspects of multiple instruction multiple data stream (MIMD) architectures can be exploited for efficient solution of the consistent labeling problem. The behavior of three parallel algorithms for object labeling is investigated. These algorithms attempt to take advantage of the strengths of MIMD architectures. The algorithms are implemented on the Myrias SPS-2 multiprocessor architecture using the Myrias model of parallel computation and the pardo programming construct. An analysis of the behavior of these algorithms and recommendations for their improvement are presented. In addition, a method of ordering the search using characteristics of the problem to eliminate inconsistent labelings early in the search is proposed. This ordering technique has a significant effect on the behavior of labeling algorithms by increasing the effective use of available parallel resources. Author (CISTI)

A high speed very large scale integration architecture is proposed for computing the radix-2 complex butterfly algorithm. The architecture employs redundant binary arithmetics, parallel pipelining, and Booth's algorithm. A 16-by-12-bit radix-2 complex butterfly was implemented in a 15,000-gate, 180-pin pin-grid-array application specific integrated circuit (ASIC). The ASIC technology is a 1.5-micron complementary metal oxide silicon gate-array. The 20 ASIC prototypes were a first-pass success, and test results show an average complex data sampling rate of 12.3 MHz. Pairs of radix-2 complex butterfly ASIC and the switch ASIC can be grouped to form a high-speed, 49.2 Msamples/sec parallel pipeline fast Fourier transform (FFT) processor of sizes up to 32-point with some external memory integrated circuits. The target application of the high-speed FFT is in the multi-carrier group demodulator of an on-board satellite processor system. The complex butterfly ASIC also was built-in self-test circuitry to assist chip-level and board-level testing. The complex butterfly architecture allows an easy migration path for increasing the data sampling rate to 75 MHz.

A method is proposed for generalizing existing distributed simulation algorithms such as Time Warp and Chandy-Misra to create a unified distributed simulation (UDS) algorithm. Models from different paradigms can be mixed within one simulation, resulting in a more powerful environment for creating complex simulations. It is shown that UDS extends the functionality of the current distributed simulation techniques. UDS allows components to describe how and when they are willing to receive and process messages and as a result gives the user more power and flexibility. Current distributed simulation techniques are presented and contrasted. Computational reflection and speculation are related to the UDS algorithm and the concurrent object oriented programming environment created to support Rival, its implementation, is detailed. Rival is implemented in Smalltalk and uses ideas from computational reflection and actor theory to create a sound and flexible model of concurrency. Author (CISTI)

COMMUNICATION ON THE PARAGON
David Greenberg, Barney Maccabe, Kevin S. McCurley, Rolf Riesen, and Stephen Wheat 15 Oct. 1993 8 p Presented at the Intel Super Computer Users Group Meeting, St. Louis, MO, 4 Oct. 1993
(Contract DE-AC04-94AL-85000)
(DE94-003103; SAND-93-2596C; CONF-9310232-2) Avail: CASI HC A02/MF A01

In this note the authors describe the results of some tests of the message-passing performance of the Intel Paragon. These tests have been carried out under both the Intel-supplied OSF/1 operating system with an NX library and also under an operating system called SUNMOS (Sandia UNM Operating System). For comparison with the previous generation of Intel machines, they have also included the results on the Intel Touchstone Delta. The source code used for these tests is identical for all systems. As a result of these tests, the authors can conclude that SUNMOS demonstrates that the Intel Paragon hardware is capable of very high bandwidth communication and that the message coprocessor on Paragon nodes can be used to give quite respectable latencies. Further tuning can be expected to yield even better performance. DOE

'Distributed Computing and Network' is a hot topic in the field of computing. Recent progress in the computer technology is providing new paradigm for computing even in High Energy Physics. Particularly the workstation based computer system is opening new active field of computer application to sciences. The major topics discussed in this symposium are distributed computing and wide area research network for domestic and international link. The two days symposium provided enough topics to foresee the next direction of our computing environment. 70 people got together to discuss these interesting themes as well as information exchange on the computer technologies. PLANNING FOR THE FUTURE OF THE DREnet: THE WAY AHEAD
T. Symchych 31 Mar. 1993 58 p Sponsored by National Defence Headquarters
(NRNS-002-00-001-01; DSIS-94-00165; CTN-94-61120) Avail: CASI HC/04

In the 1970's and 1980's, Canadian Department of National Defense staff from several Defence Research Establishments (DRE's) obtained accounts on computer systems connected to the U.S. Department of Defense ARPANET. The favorable experiences gained resulted in requests to provide similar technology within Canada. An experimental network was established at the Communications Research Centre Ottawa to address this need, and this network evolved into the current DREnet, which connects over 20 sites through a central gateway at DRE Ottawa. DREnet is now used as a testbed for examination of new services and technologies available in the Internet world. Work was carried out in message handling, directory services, application and network level protocols, and audio/video services. Information is given on where the DREnet resides in the international research network community, the defense research community, and the national research network community. Various issues that must be addressed by the DREnet community in planning for the future are discussed, including DREnet's relations with Internet, standards, resource sharing, security, new transmission technologies, and bandwidth. Recommendations are made regarding future DREnet infrastructure, services, management, research projects, and interaction with other communities. CISTI

The quantitative description of cell structures in light microscope images is an important task in biological research. The inclusion of digital image processing techniques and fluorescent markers into light microscope imaging has recently made this task feasible. In this paper, we present a method for detection of filamentary structures in cell images that have been highlighted with fluorescent markers. The method has three stages. First, pixels belonging to fiber contours are extracted from the image. Then these pixels are grouped together based on proximity by a minimal spanning tree. Finally, the fiber contours are determined as sub-trees of the minimal spanning tree. Once the pixels belonging to individual fibers contours have been determined, quantitative statistics describing the fibers in the cell can be calculated. DTIC

OPTIMAL CONTROL DESIGN ADVANTAGES UTILIZING TWO-DEGREE-OF-FREEDOM CONTROLLERS M.S. Thesis
Michael J. Stephens Dec. 1993 188 p
(AD-A273839; AFIT/GAE/ENY/93D-27) Avail: CASI HC A09/MF A02

The purpose was to investigate and describe the differences between a one-degree-of-freedom (1-DOF) controller, in which a controller is placed in a single location in the control loop, and a two-degree-of-freedom (2-DOF) controller, in which two separate controllers are designed - one in the feedback loop and the other as a prefilter in the forward loop. The approach involved summarizing the major rules governing loop shaping for performance and robustness in the 1-DOF case and then extending the concepts to the 2-DOF case. H(sub 2) optimization was utilized to perform several types of SISO examples and one MIMO example to verify the concepts. In all cases, the 2-DOF controller exhibited superior tracking performance over a wide range of plant disturbances and measurement noises compared to the 1-DOF model. DTIC

COLOR IMAGE SEGMENTATION M.S. Thesis
Kimberley A. McCrae Dec. 1993 65 p
(AD-A274027; AFIT/GEO/ENG/93D-02) Avail: CASI HC A04/MF A01

The most difficult stage of automated target recognition (ATR) is segmentation. Current AFIT segmentation problems include faces and tactical targets; previous efforts to segment these objects have used intensity and motion cues. A color preprocessing scheme to be used with the other segmentation techniques was developed. A neural network is trained to identify the color of a desired object, eliminating all but that color from the scene. Gabor correlations and 2D wavelet transformations will be performed on stationary images; and 3D wavelet transforms on multispectral data will incorporate color and motion detection into the machine visual system. It was demonstrated that color and motion cues can enhance a computer segmentation system. Results from segmenting faces both from the AFIT data base and from video taped television are presented; results from tactical targets such as tanks and airplanes are also given. Color preprocessing is shown to greatly improve the segmentation in most cases. DTIC

Television and computing have an interesting intersection in the topic of how to put computer software into the television infrastructure. It is widely recognized that the result is a home information appliance. However, despite previous commercial experimentation, such an appliance has not emerged as successful. Perhaps there is only a deficiency in properly conceptualizing the appliance. In keeping with this theme, this paper presents a theory of why people value information. Using this theory as a design aid in the creation of future home information appliances should improve their chances of commercial success. DTIC

Turbinia-Vyasa is a computer-based instructional system that trains operators to troubleshoot and diagnose faults in marine power plants. It is implemented on Apple Macintosh 2 computers. The simulator, Turbinia, is based on a hierarchical representation of subsystems, components, and primitives. Vyasa is the computer-based tutor that teaches the troubleshooting task using Turbinia. The simulator, an interactive, direct manipulation interface, and the tutor (with its expert, student, and instructional modules) comprise the architecture for the instructional system. In this paper, we discuss the details of knowledge organization that supports the functions of the three major elements of the intelligent tutoring system. DTIC

THE DETERMINATION OF SURFACE ROUGHNESS FROM REFLECTED STEP EDGES
Ronald A. Stone and Steven A. Shafer Nov. 1993 39 p
(Contract F33615-90-C-1465; ARPA Order 7597)
(AD-A273987; CMU-RI-TR-93-25) Avail: CASI HC A03/MF A01

The ability to measure the roughness of surfaces will be important for general purpose machine vision systems, in which a robot attempts to passively gain information about its environment. Although the traditional study of profilometry is well developed, its methods are unsuitable for this endeavor, since they require specialized apparatuses such as laser interferometers and styluses. We propose a method for the visual determination of surface roughness which does not require strong environmental constraints such as coherent light and small samples of the surface in question. We determine surface roughness by the measurement of the sharpness of the edges of an image reflected in a rough surface. We choose step edges since they will be present in many environments, and because the methods of edge detection and localization are mature. For these initial experiments, we assume a common surface roughness model of simple form, which we believe models milled or rolled surfaces. We show that if we also assume a known shape for the reflective surface and a known position for the viewer, we may calculate a roughness parameter. For our surface roughness model, we show that the resulting intensity distribution may be given in closed form. We then show the results of experiments performed with planar surfaces in a controlled environment and give the calculated roughness parameter. We compare these results with the values of the roughness as measured with a stylus profilometer, and find that the results are quite different. We discuss the possibilities that this difference is due to the non-Gaussian character of the surface height distribution, and the possibility that the difference arises from the difference in measurement procedures. INTEGRATION OF INTERACTIVE INTERFACES WITH INTELLIGENT TUTORING SYSTEMS: AN IMPLEMENTATION

Vijay Vasandani and T. Govindaraj Sep. 1993 42 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-87-K-0482; DA Proj. RM3-3-M-20)
(AD-A273869; CHMSR-TR-93-2) Avail: CASI HC A03

Turbinia-Vyasa is an instructional system that trains operators in diagnostic problem solving in the domain of marine power plants. It is comprised of a steam power plant simulator and an intelligent tutoring system. The simulator, Turbinia, is based on a hierarchical representation of subsystems, components, and primitives together with necessary physical and logical linkages among them. Vyasa is the computer-based tutor that teaches the troubleshooting task using Turbinia. The simulator, an interactive, direct manipulation interface, and the tutor (with its expert, student, and instructional modules) comprise the instructional system. The interactive interface to the system and the tutor forms an integral and essential component of the instructional system. The interface, including important features and implementation details is discussed. The presentation includes details of the interactions. DTIC

ADAPTIVE OPTIMIZATION AND CONTROL USING NEURAL NETWORKS

W. C. Mead, S. K. Brown, R. D. Jones, P. S. Bowling, and C. W. Barnes 22 Oct. 1993 18 p Presented at the International Conference on Accelerator and Large Experimental Control Systems, Berlin, Germany, 18-22 Oct. 1993
(Contract W-7405-eng-36)
(DE94-003941; LA-UR-93-4102; CONF-931023-9) Avail: CASI HC A03/MF A01

Recent work has demonstrated the ability of neural-network-based controllers to optimize and control machines with complex, non-linear, relatively unknown control spaces. A brief overview of neural networks via a taxonomy illustrating some capabilities of different kinds of neural networks is presented. Some successful control examples, particularly the optimization and control of a small-angle negative ion source, are presented. DOE

RATIONAL HANDLING OF MULTIPLE GOALS FOR MOBILE ROBOTS

Richard Goodwin and Reid Simmons 1 Nov. 1993 18 p
(Grant NAGw-1175)
(NASA-CR-195177; NAS 1.26:195177; AD-A273733; CMU-CS-93-204)
Avail: CASI HC A03/MF A01

This report examines a method for handling multiple active goals for mobile robots. Specifically, the focus is on asynchronous goal activation and on how to incorporate the accomplishment of a newly active goal into a partially executed plan. A utility based decision theoretic approach is adopted for investigating the tradeoffs that must be made. The applicability of decision theory to problems in artificial intelligence and planning in particular has long been recognized. In his review of the use of decision theory, Horvitz argues for its use as a basis for making choices in artificial intelligence. In an early example, Feldman and Sproull, in their analysis of planning for the hungry monkey problem, used utility based decision theory to evaluate plans taking into account uncertainty and risk. More recent work has focused on time dependent planning and on applying decision theory to search. The work presented here differs from these in that it focuses on plan evaluation when all goals are not initially known and the plan must be reformulated as goals become active. In such cases, the time dependent utility of goal satisfaction, as well as the time distribution of utilities and resource use, must be taken into account. DTIC

ADAPTIVE PATH PLANNING IN CHANGING ENVIRONMENTS

Pang C. Chen Oct. 1993 15 p
(Contract DE-AC04-94AL-85000)
(DE94-003269; SAND-92-2744) Avail: CASI HC A03/MF A01

Path planning needs to be fast to facilitate real-time robot programming. Unfortunately, current planning techniques are still too slow to be effective, as they often require several minutes, if not hours of computation. To overcome this difficulty, we present an adaptive algorithm that uses previous experience to speed up future performance. It is a learning algorithm suitable for incrementally-changing environments such as those encountered in manufacturing of evolving products and waste-site remediation. The algorithm extends our previous work for stationary environments in two directions: (1) for minor environmental change, an object-attached experience abstraction scheme is introduced to increase the flexibility of the learned experience; and (2) for major environmental change, an on-demand experience repair scheme is also introduced to retain those experiences that remain valid and useful. In addition to presenting this algorithm, we identify three other variants with different repair strategies. To compare these algorithms, we develop an analytic model to compare the costs and benefits of the corresponding repair processes. Using this model, we formalize the concept of incremental change, and prove the optimality of our proposed algorithm under such change. Empirically, we also characterize the performance curve of each variant, confirm our theoretical optimality results, and demonstrate the practicality of our algorithm. DOE

ASYMPTOTICALLY STABLE NEURAL NETWORKS FOR IDENTIFICATION OF NONLINEAR DYNAMIC SYSTEMS M.S. Thesis

Chris M. Jubien 1993 130 p
(ISBN-0-315-84328-4; CTN-94-61022) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Neural networks have the advantage that they are extremely flexible and, once trained, provide accurate and fast modelling of complex systems. Stable neural networks are studied for application in the identification of nonlinear dynamic systems. A novel approach to system identification is used. The approach is based on a class of recurrent neural networks which has been proven to be asymptotically stable. A neural network was shown which could implement an arbitrary linear system, and a neural network was also designed which had a peaked response suitable for the task of scheduling various models for different input and output levels. These two neural networks were then combined to produce an architecture suitable for identification of nonlinear systems. Equations for training these neural networks to model the complex behavior that nonlinear systems exhibit were developed. Computer simulations were used to test the theory. In a simulated system, the neural network is found to provide good modelling. The equations were also applied to train a neural network to model the dynamic behavior of a boat and a PUMA-560 two-link robot arm. Author (CISTI)

DESIGNING AND OPTIMIZING FUZZY-LOGIC CONTROLLERS M.S. Thesis

Sanjiv K. Lakhanpal 1993 161 p

(ISBN-0-315-83505-2; CTN-94-61041) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Fuzzy logic is an approximate reasoning model aimed at characterizing the modes of reasoning humans use to make rational decisions in environments of uncertainty and imprecision. It incorporates elements of expert systems, approximate reasoning, multiple valued logic, and probability theory. The fuzzy logic controller provides a means of converting a linguistic control strategy based on expert knowledge into an automatic control strategy. An optimized fuzzy logic controller is presented to meet the needs of real-time fuzzy signal processing. The architecture is optimized towards increasing the rate of inference, allowing for easy reconfiguration and reprogramming in order to speed the evaluation and development stages, and decreasing the cost of resources. Discussions are provided on fuzzification strategies and the effects of transducer error, inference engine architectures, a heuristic methodology for determining physical parameters of a fuzzy controller, defuzzification methods and architectures, the composition of the knowledge base, and the interface with and the control of the fuzzy controller. VIRTUAL DATA
E. Bjorklund 1993 7 p Presented at the International Conference on Accelerator and Large Experimental Control Systems, Berlin, Germany, 18-22 Oct. 1993
(Contract W-7405-eng-36)
(DE94-002718; LA-UR-93-3697; CONF-931023-7) Avail: CASI HC A02/MF A01

In the 1970's, when computers were memory limited, operating system designers created the concept of 'virtual memory' which gave users the ability to address more memory than physically existed. In the 1990's, many large control systems have the potential for becoming data limited. We propose that many of the principles behind virtual memory systems (working sets, locality, caching, and clustering) can also be applied to data-limited systems - creating, in effect, 'virtual data systems.' At the Los Alamos National Laboratory's Clinton P. Anderson Meson Physics Facility (LAMPF), we have applied these principles to a moderately sized (10,000 data points) data acquisition and control system. To test the principles, we measured the system's performance during tune-up, production, and maintenance periods. In this paper, we present a general discussion of the principles of a virtual data system along with some discussion of our own implementation and the results of our performance measurements. DOE

SINGLE-SERVER QUEUES WITH SPATIALLY DISTRIBUTED ARRIVALS
D. P. Kroese and V. Schmidt (Ulm Univ., Germany.) Jun. 1993 32 p Prepared in cooperation with Ulm Univ.
(PB94-126638; MEMO-1142) Avail: CASI HC A03/MF A01

Consider a queueing system where customers arrive at a circle according to a homogeneous Poisson process. After choosing their positions on the circle, according to a uniform distribution, they wait for a single server who travels on the circle. The server's movement is modeled by a Brownian motion with drift. Whenever the server encounters a customer, he stops and serves this customer. The service times are independent, but arbitrarily distributed. The model generalizes the continuous cyclic polling system (the diffusion coefficient of the Brownian motion is zero in this case) and can be interpreted as a continuous version of a Markov polling system. Using Tweedie's lemma for positive recurrence of Markov chains with general state space, it is shown that the system is stable if and only if the traffic intensity is less than one. Moreover, a stochastic decomposition result is derived which leads to equilibrium equations for the stationary configuration of customers on the circle. Steady-state performance characteristics are determined, in particular the expected number of customers in the system as seen by a travelling server and at an arbitrary point in time. NTIS

SENSOR-BASED NAVIGATION OF A MOBILE ROBOT USING AUTOMATICALLY CONSTRUCTED FUZZY RULES
Y. Watanabe and F. G. Pin 1993 8 p Presented at the ICAR 1993: 6th International Conference on Advanced Robotics, Tokyo, Japan, 1-2 Nov. 1993
(Contract DE-AC05-84OR-21400)
(DE94-001137; CONF-9311107-2) Avail: CASI HC A02/MF A01

A system for automatic generation of fuzzy rules is proposed which is based on a new approach, called 'Fuzzy Behaviorist,' and on its associated formalism for rule base development in behavior-based robot control systems. The automated generator of fuzzy rules automatically constructs the set of rules and the associated membership functions that implement reasoning schemes that have been expressed in qualitative terms. The system also checks for completeness of the rule base and independence and/or redundancy of the rules to ensure that the requirements of the formalism are satisfied. Examples of the automatic generation of fuzzy rules for cases involving suppression and/or inhibition of fuzzy behaviors are given and discussed. Experimental results obtained with the automated fuzzy rule generator applied to the domain of sensor-based navigation in a priori unknown environments using one of our autonomous test-bed robots are then presented and discussed to illustrate the feasibility of large-scale automatic fuzzy rule generation using our proposed 'Fuzzy Behaviorist' approach. BLURRED FOCAL ELEMENTS GENERALIZATION OF DEMPSTER'S RULE [EN GENERALISERING AV DEMPSTERS REGEL FOR OTYDLIGA FOKALELEMENT]
Johan Schubert Aug. 1993 15 p In SWAHILI See also PB92-151455
(PB94-124278; FOA-C-20938-2.7) Avail: CASI HC A03/MF A01

When propositions are poorly specified it is uncertain if two propositions of different pieces of evidence are in logical conflict, i.e., it is uncertain whether the intersection between their corresponding focal elements is empty. To distinguish between normal focal elements and these poorly represented focal elements, the latter shall be called blurred focal elements. In order to resolve the ambiguity, this uncertainty is modeled by creating an additional piece of evidence against the simultaneous belief in both propositions and treating the two original pieces of evidence as non-conflicting. A generalization of Dempster's rule for evidence with blurred focal elements based on this methodology is presented. NTIS

GREY-BOX MODELLING AND IDENTIFICATION TOPICS Ph.D. Thesis
Herbert Johannes Ant Franciscus 21 Dec. 1992 176 p
(PB94-126380; ISBN-90-9005644-0) Avail: CASI HC A09/MF A02

The first part of this thesis presents an industrial view on intelligent adaptive control, aiming at the development of multivariable adaptive control methods for slowly-varying, nonlinear, stochastic, dynamic processes in the petrochemical industry. Continuous adaptation is often unfeasible, as it is too expensive or too risky under difficult circumstances. An 'at-request tuner' concept is propagated, which features automated modeling and controller retuning at user's request only and which is especially suitable for mode-switch processes. Chapter two deals with the architecture of the at-request tuner, which consists of a supervisor with performance monitor and library modules, and modules for control design, model identification, and test-signal generation. Chapter three is devoted to possible improvements in experiment design. In chapter four, an adaptive forgetting strategy (AFS) for use in on-line identification is highlighted. Chapter five contains the central topic of this thesis: grey-box modeling and identification. Conventional identification methods postulate a statistical, black-box input-output model for the process dynamics. This approach has important advantages, the most prominent being that no 'expensive' physical model is required. It is argued that a compromise between the full-blown physical and the statistical approach is more attractive. Such a compromise would lead to a 'grey-box' model class where strategic process characteristics, such as stability, are forced upon a family of suitable statistical models. Chapter six elaborates upon the topic of the previous chapter. In chapter seven, grey-box estimators are applied to linearized physicochemical reactor models. NTIS

BUILDING 3-D MODELS FROM UNREGISTERED RANGE IMAGES

Kazunori Higuchi, Martial Hebert, and Katsushi Ikeuchi Nov. 1993 23 p
(Contracts F33615-90-C-1465; F33615-93-1-1282; NSF IRI-92-24521)
(AD-A274126; CMU-CS-93-214) Avail: CASI HC A03/MF A01

In this paper, a new approach is described for building a three-dimensional model from a set of range images. The approach is able to build models of free-form surfaces obtained from arbitrary viewing directions, with no initial estimate of the relative viewing directions. The approach is based on building discrete meshes representing the surfaces observed in each of the range images, mapping each of the meshes to a spherical image, and computing the transformations between the views by matching the spherical images. The meshes are built using an iterative fitting algorithm previously developed; the spherical images are built by mapping the nodes of the surface meshes to the nodes of a reference mesh on the unit sphere and by storing a measure of curvature at every node. The algorithms used for building such models from range images and for matching them are described. Results obtained using range images of complex objects are shown. DTIC

ALUMINUM ALLOY 8090-T8771 THICK PLATE MATERIAL CHARACTERIZATION Interim Report, Oct. 1991 - May 1993
Russell R. Cervay Oct. 1993 64 p
(Contract F33615-90-C-5915)
(AD-A274146; UDR-TR-93-71; WL-TR-93-4111) Avail: CASI HC A04/MF A01

The purpose of this study was to evaluate the mechanical properties of Al-Li alloy 8090, 1.750 inch thick plate thermally processed to the T8771 condition. Room temperature properties evaluated were: tensile, compression, bearing, and shear strengths, fracture toughness, notched and smooth fatigue, and constant amplitude and variable amplitude fatigue crack growth rate. Constant amplitude fatigue crack growth rate test data was generated at two load-ratios, 0.1 and 0.33, and in both laboratory air and saturated air environments. As expected, tensile properties were acceptable for the various specimen orientations removed from the plate's rolling plane: there was a significant drop in yield strength for in-plane specimens oriented 45 degrees off the rolling direction. Also, through-the-thickness ductility was quite low. Compression, bearing, shear, and fatigue properties were all good for the specimen orientations examined. The fracture toughness was acceptable for specimens with a L-T and T-L orientations: for through-the-thickness loading, i.e. S-L orientation, the toughness was cut in half. The material showed superior fatigue crack resistance attributable to considerable crack closure induced by very course crack faces. The exceptional surface roughness is characteristic of a mostly unrecrystallized grain structure in Al-Li materials. The high level of closure is manifested as a plateau of nearly constant fatigue crack growth rate over the normally linear log-da/dN versus log delta K mid-range seen in conventional high strength aluminum products and Al-Li materials having a recrystallized grain structure. USING DISCOVERY-BASED LEARNING TO PROVE THE BEHAVIOR OF AN AUTONOMOUS AGENT M.S. Thesis
David N. Mezera Dec. 1993 144 p
(AD-A274131; AFIT/GCE/Eng/93D-10) Avail: CASI HC A07/MF A02

Computer-generated autonomous agents in simulation often behave predictably and unrealistically. These characteristics make them easy to spot and exploit by human participants in the simulation, when we would prefer the behavior of the agent to be indistinguishable from human behavior. An improvement in behavior might be possible by enlarging the library of responses, giving the agent a richer assortment of tactics to employ during a combat scenario. Machine learning offers an exciting alternative to constructing additional responses by hand by instead allowing the system to improve its own performance with experience. This thesis presents NOSTRUM, a discovery-based learning (DBL) system designed to work in tandem with the MAXIM air combat simulator. Through a process of repeated experimentation modeled after the scientific method, NOSTRUM was able to discover many responses that were more appropriate than the single mode of agent control implemented in the original MAXIM program. NOSTRUM often found responses that dramatically improved the offensive position of the agent, and it sometimes placed the agent in position for an extended shot on the target when one was not available before. MULTIPLE MODEL ADAPTIVE CONTROL OF A LARGE FLEXIBLE SPACE STRUCTURE WITH PURPOSEFUL DITHER FOR ENHANCED IDENTIFIABILITY M.S. Thesis
James A. Fitch Dec. 1993 142 p
(AD-A274132; AFIT/GA/Eng/93D-01) Avail: CASI HC A07/MF A02

Dithering techniques for enhancing uncertain parameter identification with moving-bank Multiple Model Adaptive Estimation (MMAE) and Control (MMAC) algorithms are analyzed in this thesis. The dithering techniques and multiple-model adaptive algorithms are applied to the SPICE 2 flexible space structure. The dithering techniques studied include purposefully constructed square wave, sine wave (fixed and swept frequency) and wide-band noise wave forms. Purposeful rigid-body slew commands are also used in order to excite the structure's flexible bending modes. Dither inputs into the structure are performed in an effort to enhance the open-loop identifiability of the uncertain parameter, namely a scalar multiplier on the undamped natural frequencies of the flexible bending modes. Correct identification of this parameter enables the MMAE and MMAC algorithms to quell any vibrations induced into the structure, in the face of varying parameter values. The results of this study indicate that purposefully constructed dither signals do enhance parameter identification significantly. The parameter identification enhancement due to rigid-body slew command input was shown to be less effective than that with sinusoid and wide band noise dither inputs, however. DTIC

CONTROL ORIENTED SYSTEM IDENTIFICATION Final Report, 1 Jun. 1991 - 14 Jun. 1993
Clas A. Jacobson Aug. 1993 7 p
(Grant AF-AFOSR-0222-91)
(AD-A274162; AFOSR-93-0898TR) Avail: CASI HC A02/MF A01

The research goals for this grant were to obtain algorithms for control oriented system identification to construct dynamical models of systems based primarily on measured data that are compatible with robust control design techniques. The research carried out under this grant has continued the research on control oriented identification originated by the PI and his collaborators, has extended control oriented identification methods to new classes of dynamical systems and has initiated a study unifying identification and control laws design. The research that has extended existing problem formulation concerns the construction of algorithms for linear shift invariant systems using a combination of apriori and experimental information. Algorithms for the identification of continuous time systems and efficient linear algorithms have been constructed. The research that has extended the existing problem formulation concerns the development of algorithms for the construction of parameterized linear families from a combination of apriori and measured information. Algorithms for this type of nonlinear system identification have been given that produce models suitable for gain scheduled controllers. Finally research into the integration control oriented identification and robust control for slowly time varying systems was initiated under this grant. DTIC

OPERATOR THEORETIC METHODS IN THE CONTROL OF DISTRIBUTED AND NONLINEAR SYSTEMS Final Report, 1 Oct. 1989 - 30 Sep. 1993

Allen R. Tannenbaum 2 Nov. 1993 38 p
(Grant AF-AFOSR-0024-90)
(AD-A274160; AFOSR-93-0899TR) Avail: CASI HC A03/MF A01

In this final technical report, we outline a number of problems in robust and nonlinear control theory which we have studied using an operator theoretic methodology. In particular, we discuss an approach to the structured singular value and u-synthesis procedure in robust control which is based on a new type of interpolation method. We consider nonlinear extension of H-infinity optimization theory and investigate corresponding question in causality which arise in this area. Moreover, we discuss a saddle-point, game-theoretic approach to such problems. Further, we sketch the application of our skew Toeplitz methods to distributed (infinite dimensional) H-infinity control. We also consider and h-infinity of approach to sampled data systems based on a lifting method, as well as consider problem using h-infinity-H(sup 2) combined suboptimal controller. Finally, we list some of our results in image processing and computer vision as applied to visual tracking. DTIC

IMPULSIVE CONTROL AND STABILIZATION M.S. Thesis

Allan Richard Willms 1993 143 p
(ISBN-0-315-84563-5; CTN-94-61076) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A system of ordinary differential equations subject to an impulsive (discrete-time) controller is considered. The question of controllability is answered for linear systems and, for the case where the system has constant coefficients, the controllability criteria are shown to be the same as that for classical continuous control functions. Two optimal control problems are analyzed and a set of equations is presented which constitutes a set of necessary and sufficient conditions that must be satisfied by the optimal solution. The question of stabilizability of any state is studied for nonlinear autonomous systems. Both necessary and sufficient conditions for a particular state to be stabilizable are established using the notion of an impulsive invariant set and the method of Liapunov functions. Finally, the stability properties of a general nonautonomous impulsive system are analyzed. This analysis yields a method of testing whether a particular impulsive program will stabilize a given system. Further, Liapunov stability results for impulsive systems are extended to large scale systems in a manner analogous to extensions for purely continuous or purely discrete systems. Author (CISTI)

FINITE TIME DIFFERENTIAL EQUATIONS AND THEIR APPLICATION TO CONTROL SYSTEMS M.S. Thesis

Evelyn Marie Baylis Aug. 1993 72 p
(ISBN-0-315-85158-9; CTN-94-61099) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A proposition is presented that allows finding one-dimensional finite time differential equations. A proposition is then considered which can be used to determine whether or not an n-dimensional equation is finite time. The proposition is employed to state two Lyapunov-like finite time theorems. Some results of two-dimensional finite time differential equations are studied and extended to an n-dimensional theorem. An example of this theorem for $n=2$ is presented and it is shown how it might be used to demonstrate that a multi dimensional system is finite time. Sliding mode control is then discussed, and the sliding mode method is used to find a smooth two-dimensional differential equation that is finite time. The method could possibly be generalized to create an n-dimensional finite time differential equation, and an imperfect answer to this problem is stated along with how it may be used in a practical sense. Finally, application of the above theories to finite time controllers is discussed. Finite time controllers can be used in many of the same areas already occupied by bang-bang controllers and sliding mode controllers, such as in robot manipulators. CISTI

TOOLS FOR QUANTITATIVE STABILITY ROBUSTNESS ANALYSIS Ph.D. Thesis

Li Qiu 1990 218 p
(ISBN-0-315-59950-2; CTN-94-60982) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Stability is a crucial requirement for any control system. Since the modeling of a physical system is always inexact, this implies that the effect of model uncertainty on system stability must be considered. Stability robustness analysis has the purpose of considering such effects. The stability robustness of linear time-invariant finite dimensional systems, focusing on three types of objects fundamental in the stability analysis of such systems. The stability robustness analysis is carried out quantitatively and new mathematical tools are introduced. For matrices subject to unstructured uncertainties, the stability radius of a stable matrix is defined as the distance of the matrix to the set of unstable matrices. A tensor product method is then used to study the properties of the stability radius. For polynomials with affine uncertainties, a general solution is obtained using tools from convex analysis. For real rational matrices, a new family of metrics called pointwise gap metrics is defined on the space of all real rational matrices of the same size. Using this metric, quantitative measures for the open loop and closed loop stability robustness are obtained. Author (CISTI)

AN INVESTIGATION OF METHODS FOR DETERMINING DEPTH FROM FOCUS Ph.D. Thesis

John E. Ens Jul. 1990 201 p
(ISBN-0-315-64015-4; CTN-94-60990) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The concept of depth from focus involves calculating distances to points in an observed scene by modeling the effect that the camera's focal parameters have on images acquired with a small depth of field. This technique does not require special scene illumination and needs only a single camera. Deconvolving and modeling the defocus operator is the most difficult segment of calculating depth from focus. Some fundamental problems with the conventional method of isolating the defocus operator are exposed, such as inaccuracies in finding the frequency domain representation and the presence of border effects. To solve the general depth from focus problem, an application of an iterative matrix based method is presented. This uses two images of the same scene, obtained under different conditions of defocus. The defocus operator may be assumed using a parametric model or experimentally measured. Tradeoffs in implementation are resolved through regularization. The method is theoretically justified, and shown to eliminate problems mentioned above. A constrained inverse filtering method and the iterative matrix based method are experimentally implemented on four scenes. The experiments show that the iterative matrix solution consistently yields more accurate results. Author (CISTI)

ON MODELING AND CONTROLLING INTELLIGENT SYSTEMS

W. B. Dress 1993 8 p Presented at the 2nd International Conference on Information and Knowledge Management, Washington, DC, 1-5 Nov. 1993
(Contract DE-AC05-84OR-21400)
(DE94-002446; CONF-9311112-1) Avail: CASI HC A02/MF A01

The aim of this paper is to show how certain diverse and advanced techniques of information processing and system theory might be integrated into a model of an intelligent, complex entity capable of materially enhancing an advanced information management system. To this end, we first examine the notion of intelligence and ask whether a semblance thereof can arise in a system consisting of ensembles of finite-state automata. Our goal is to find a functional model of intelligence in an information-management setting that can be used as a tool. The purpose of this tool is to allow us to create systems of increasing complexity and utility, eventually reaching the goal of an intelligent information management system that provides and anticipates needed data and information. We base our attempt on the ideas of general system theory where the four topics of system identification, modeling, optimization, and control provide the theoretical framework for constructing a complex system that will be capable of interacting with complex systems in the real world. These four key topics are discussed within the purview of cellular automata, neural networks, and evolutionary programming. This is a report of ongoing work, and not yet a success story of a synthetic intelligent system. DOE

LOCAL PERFORMANCE OPTIMIZATION FOR A CLASS OF REDUNDANT EIGHT-DEGREE-OF-FREEDOM MANIPULATORS
Robert L. Williams, II Mar. 1994 23 p
(RTOP 586-02-11)
(NASA-TP-3417; L-17289; NAS 1.60:3417) Avail: CASI HC A03/MF A01

Local performance optimization for joint limit avoidance and manipulability maximization (singularity avoidance) is obtained by using the Jacobian matrix pseudoinverse and by projecting the gradient of an objective function into the Jacobian null space. Real-time redundancy optimization control is achieved for an eight-joint redundant manipulator having a three-axis spherical shoulder, a single elbow joint, and a four-axis spherical wrist. Symbolic solutions are used for both full-Jacobian and wrist-partitioned pseudoinverses, partitioned null-space projection matrices, and all objective function gradients. A kinematic limitation of this class of manipulators and the limitation's effect on redundancy resolution are discussed. Results obtained with graphical simulation are presented to demonstrate the effectiveness of local redundant manipulator performance optimization. Actual hardware experiments performed to verify the simulated results are also discussed. A major result is that the partitioned solution is desirable because of low computation requirements. The partitioned solution is suboptimal compared with the full solution because translational and rotational terms are optimized separately; however, the results show that the difference is not significant. Singularity analysis reveals that no algorithmic singularities exist for the partitioned solution. The partitioned and full solutions share the same physical manipulator singular conditions. When compared with the full solution, the partitioned solution is shown to be ill-conditioned in smaller neighborhoods of the shared singularities. Author (revised)

MULTI-SENSOR DATA FUSION IN A DISTRIBUTED ENVIRONMENT: ARCHITECTURAL SOLUTIONS
R. G. Zuidgeest 17 Jun. 1992 47 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MOD-01689029811)
(NLR-TP-92243-U; ETN-94-95450) Avail: CASI HC A03

The human operator observing the real world is confronted with a huge amount of data from multiple sensors observing that world. Multisensor data fusion (MSDF) is one of the emerging fields in advanced information processing, concerned with fusing sensor data from these multiple sensors. Automated MSDF can help the operator by processing sensor data into concise and surveyable information that is more useful than any sensor can separately provide. The merit of MSDF can be increased by employing the knowledge of the human operator about the real world, the sensor systems, and the fusion process. With the aid of this knowledge, automated MSDF can assign meaning to sensor data and is able to reason about the observed world at a high level as humans do. Often, MSDF has an inherent distributed character, spatially as well as functionally. Architectural solutions should cope with this characteristic. The possibility of employing distributed artificial intelligence techniques in MSDF applications, in particular command and control applications such as battlefield surveillance, is focused on. Candidate architectures are proposed in which MSDF functions and aspects of distributed networks are demonstrated. ESA

PULSE CONTROL METHOD AND ITS CHARACTERISTICS
Junya Shimazaki (Japan Atomic Energy Research Inst., Tokai.) and Nobuyuki Ishikawa (Japan Atomic Energy Research Inst., Tokai.) May 1993 36 p In JAPANESE Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-701187; JAERI-M-93-063) Avail: CASI HC A03 (US Sales Only)

Pulse control is defined as one of digital control techniques and acts during part of time-sampling period of control. A design method of the pulse control and its characteristics are discussed on the basis of simple control system model for three types of modern control such as pole assignment control with state variable feedback, linear quadratic optimal control and dead-beat digital control. Control performances of the pulse control corresponding to the above mentioned controls are compared to continuous and ordinary digital controls. As the results, the pulse controls are shown to have as good control performances as the other controls, although the former has strong restrictions on the control variables. Applications of the pulse control to real plants will be useful for the short time of control by a flexible design of pulse width. DOE

A new definition of robustness for continuous feedback control systems is advanced: the region of the joint allowable variation in the gain and the dead-time of the process. This region is constructed from the open loop system frequency response. The continuous time proportional integral derivative (PID), internal model control (IMC), and linear quadratic optimal control (LQOC) design procedures for a first order plus dead-time process are compared for integral square error (ISE) performance when tuned for the same level of robustness. Highest performance is achieved by PID, followed by IMC and LQOC. The continuous ISE performance of the discrete LQOC and state deadbeat IMC controllers are compared as the size of the control interval is changed. A new modified LQOC controller and a new extended horizon controller are proposed. The robustness analysis is extended to discrete systems. The state deadbeat IMC with an augmented filter and modified LQOC controllers are shown to have better ISE performance than the LQOC controller when tuned for the same level of robustness. A procedure is presented for saturation correction in multivariable one-step optimal controllers. A simultaneous correction is included which adjusts the remaining control inputs if some inputs saturate. Results on saturation correction for PID controllers are also given. Author (CISTI)

ARTIFICIAL INTELLIGENCE RESEARCH BRANCH FUTURE PLANS Progress Report, 1992
Helen Stewart, ed. Mar. 1992 78 p
(NASA-TM-109733; NAS 1.15:109733; FIA-92-07) Avail: CASI HC A05/MF A01

This report contains information on the activities of the Artificial Intelligence Research Branch (FIA) at NASA Ames Research Center (ARC) in 1992, as well as planned work in 1993. These activities span a range from basic scientific research through engineering development to fielded NASA applications, particularly those applications that are enabled by basic research carried out in FIA. Work is conducted in-house and through collaborative partners in academia and industry. All of our work has research themes with a dual commitment to technical excellence and applicability to NASA short, medium, and long-term problems. FIA acts as the Agency's lead organization for research aspects of artificial intelligence, working closely with a second research laboratory at the Jet Propulsion Laboratory (JPL) and AI applications groups throughout all NASA centers. This report is organized along three major research themes: (1) Planning and Scheduling: deciding on a sequence of actions to achieve a set of complex goals and determining when to execute those actions and how to allocate resources to carry them out; (2) Machine Learning: techniques for forming theories about natural and man-made phenomena; and for improving the problem-solving performance of computational systems over time; and (3) Research on the acquisition, representation, and utilization of knowledge in support of diagnosis design of engineered systems and analysis of actual systems. REPEATED KNOTS IN LEAST SQUARES MULTIQUADRIC FUNCTIONS Technical Report, Aug. - Oct. 1993
Richard Franke, Hans Hagen, and Gregory M. Nielson 14 Oct. 1993 18 p
(AD-A273866; NPS-MA-94-004) Avail: CASI HC A03/MF A01

A previous paper by the authors noted that there was a strong tendency to obtain near-repeated knots in their algorithm for least squares approximation of scattered data by multiquadric functions. It was observed that this leads naturally to the inclusion of derivatives of the multiquadric basis function in the approximation, and an algorithm for accomplishing this is given. A comparison of the results obtained with this algorithm and the previous one is made. While the multiple knot algorithm usually has the advantage in terms of accuracy and computational stability, there are datasets for which this is reversed. DTIC

PIECEWISE LEAST SQUARES FITTING TECHNIQUE USING FINITE INTERVAL METHOD WITH HERMITE POLYNOMIALS
Djebar Baroudi Apr. 1993 30 p
(ISSN 1235-0621)
(VTT-PUBS-135; ISBN-951-38-4253-3; ETN-94-95240) Copyright Avail: CASI HC A03/MF A01

A fitting technique based on the approximation technique of the finite element method is presented. The confidence interval for the fitted function and its first and second derivatives are calculated. The approximation assumes the fitted function and its derivatives up to the second order to be continuous. The fitting problem is formulated as an unconstrained optimization problem. The unknowns to be determined are found by minimizing the sum of squared errors. A performing software package programmed in standard FORTRAN 77 is presented. Given a set of data points, this software performs the fitting and calculates the confidence intervals of the fitted function, and its first and second derivatives. ESA

PREDICTING NONLINEAR TIME SERIES M.S. Thesis
James C. Gainey, Jr. Dec. 1993 13 p
(AD-A274051; AFIT/GEO/Eng/93D-05) Avail: CASI HC A03/MF A01

Predicting future values of a time series has many practical uses in real-time signal processing and understanding. This thesis implements an Adaptive Time Delay Neural Network (ATNN) capable of user-defined degeneration to the more common Time Delay Neural Network (TDNN). Time delays along axons or at the synapses, which vary in biological systems, motivate this research. The ATNN/TDNN test results and time series prediction capabilities are compared to those of the Real-Time Recurrent Learning (RTRL) algorithm. To show the advantages and disadvantages of using TDNN and ATNN for prediction versus the RTRL, the networks were applied to two problems: incommensurate sum of sine waves and financial time series. These data sets represent examples of nonlinear data with known and unknown mathematical functions, respectively. Although the RTRL predicted better than the ATNN for a known predictable function, this ATNN approach proved competitive in determining the direction of the future values for this function and outperforms the RTRL on the more difficult prediction task. The ATNN program, developed in C++ with an object-oriented framework, also takes much less computation time than the RTRL during training. DTIC

A POSSIBLE WAY OF CONNECTING THE GRASSMANN VARIABLES AND THE NUMBER OF GENERATION
Xiao-Gang He Apr. 1993 7 p
(DE94-601624; UM-P-93/40; OZ-93/10) Avail: CASI HC A02/MF A01 (US Sales Only)

A Left-Right symmetric model is constructed in which the number of generation is related to Grassmann variables. Two sets of complex Grassmann variables (theta(sup 1)(sub 2), theta(sup 2)(sub 2)), (theta(sup 1)(sub l), theta(sup 2)(sub l)) are associated with left-and right-handed quark and lepton fields, respectively. Expanding quark and lepton fields in powers of the Grassmann variables, it was found that there are exactly three generations of quarks and leptons. Integrating out the Grassmann variables, phenomenologically acceptable fermion mass matrices were obtained. DOE

THE ALGEBRA OF NON-LOCAL CHARGES IN NON-LINEAR SIGMA MODELS
E. Abdalla, M. C. B. Abdalla, J. C. Brunelli (Universidade Estadual de Paulista, Sao Paulo, Brazil.), and A. Zadra (Universidade Estadual de Paulista, Sao Paulo, Brazil.) Jul. 1993 30 p
(DE94-601563; IC-93/220) Avail: CASI HC A03/MF A01 (US Sales Only)

The exact Dirac algebra obeyed by the conserved non-local charges in bosonic non-linear sigma models was obtained. Part of the computation is specialized for a symmetry group O(N). As it turns out the algebra corresponds to a cubic deformation of the Kac-Moody algebra. The non-linear terms are computed in closed form. In each Dirac bracket only highest order terms (as explained), defining a saturated algebra are found. The results for the presence of a Wess-Zumino term was generalized. The algebra is very similar to the previous one, containing now a calculable correction of order one unit lower. DOE

TOWARDS A THEORY OF GROWING SURFACES: MAPPING TWO-DIMENSIONAL LAPLACIAN GROWTH ONTO HAMILTONIAN DYNAMICS AND STATISTICS
R. Blumenfeld 1993 17 p Presented at the Fluctuations and Order: The New Synthesis Workshop, Los Alamos, NM, 9-12 Sep. 1993
(Contract W-7405-eng-36)
(DE94-002636; LA-UR-93-3591; CONF-9309185-4) Avail: CASI HC A03/MF A01

I show that the evolution of a two dimensional surface in a Laplacian field can be described by Hamiltonian dynamics. First the growing region is mapped conformally to the interior of the unit circle, creating in the process a set of mathematical zeros and poles that evolve dynamically as the surface grows. Then the dynamics of these quasi-particles are transformed into a separable action-angle Hamiltonian that describes an orbital motion on a torus. A specific case is discussed explicitly, which demonstrates the integrability of the surface-tension-free Laplacian growth process. This formulation holds as long as the singularities of the map are confined to within the unit circle. This approach further allows for surface tension to be introduced as an energetic term in the resulting Hamiltonian which effects repulsion between the quasi-particles and the surface. These results are used here to formulate a first-principles statistical theory of pattern formation in stochastic growth, where noise is a key player. DOE

PHASE PORTRAITS OF QUADRATIC SYSTEMS WITH FINITE MULTIPLICITY THREE AND ONE CRITICAL POINT OF INFINITY
J. W. Reyn and X. Huang 1993 22 p
(ISSN 0922-5641)
(Rept-93-41; ETN-94-95396) Copyright Avail: CASI HC A03/MF A01

A quadratic system is an autonomous system of ordinary differential equations. An approach to investigate the phase portraits of multiplicity 3, being characterized by the most complicated infinite critical points that can occur in multiplicity 3, is presented. A multiple infinite critical point is indicated by M(sub p, q)(sup i), where i indicates the index of the point, p the number of finite critical points and q the number of infinite critical points that can bifurcate from it. If p is different from zero, the point is transversally nonhyperbolic, and for multiplicity 3 there is one such point and p = 1. The most complicated infinite critical point is then a M(sub 1,3)(sup i), a fourth order saddle node with index 0, and the only critical point at infinity possible in the systems to be studied. Investigation of these systems should serve as a stepping stone toward the study of systems in multiplicity 3 with critical point M(sub 1,2)(sup i) and finally with a M(sub 1,1)(sup i). ESA

PRECONDITIONING IN PARALLEL RUNGE-KUTTA METHODS FOR STIFF INITIAL VALUE PROBLEMS
P. J. vanderHouwen and B. P. Sommeijer May 1993 17 p
(ISSN 0169-0388)
(CWI-NM-R9310; ETN-94-95414) Copyright Avail: CASI HC A03/MF A01

From a theoretical point of view, Runge-Kutta methods of collocation type belong to the most attractive step by step methods for integrating stiff problems. These methods combine excellent stability features with the property of superconvergence at the step points. Like the initial value problem itself, they only need the given initial value without requiring additional starting values, and therefore are a natural discretization of the initial value problem. On the other hand, from a practical point of view, these methods have the drawback of requiring in each step the solution of a system of equations of dimension sd, s and d being the number of stages and the dimension of the initial value problem, respectively. In contrast, linear multistep methods, the main competitor of Runge-Kutta methods, require the solution of systems of dimension d. However, parallel computers have changed the scene and motivated the design of parallel iteration methods for solving the implicit systems in such a way that the resulting methods become efficient step by step methods for integrating stiff initial value problems. THE GENERAL PICKUP AND DELIVERY PROBLEM
M. Sol and M. W. P. Savelsbergh Nov. 1992 26 p
(ISSN 0926-4493)
(MEMO-COSOR-92-44; ETN-94-94805) Avail: CASI HC A03/MF A01

In pickup and delivery problems vehicles have to transport loads from origins to destinations without transshipment at intermediate locations. Several characteristics that distinguish them from standard vehicle routing problems are presented. A survey of the problem types and solution methods found in the literature is given. The main problem in solving multiple vehicle pickup and delivery problems is the assignment of transportation requests to vehicles. Pickup and delivery problems, as well as other routing and scheduling problems, seem to be well suited for solution approaches based on set partitioning with column generation. An important obstacle in the development of effective and efficient approximation algorithms is the lack of a reliable measure of closeness. In vehicle routing problems, customers that are geographically close to each other are likely to be served by the same vehicle. A concept similar to that of geographical closeness in vehicle routing problems does not exist for pickup and delivery problems. None of the alternatives proposed turned out to be entirely satisfactory. The development of a useful closeness concept seems crucial for progress in approximation algorithms. ESA

A LINEAR DESCRIPTION OF THE DISCRETE LOT-SIZING AND SCHEDULING PROBLEM
C. P. M. vanHoesel and Antoon Kolen (Limburg State Univ., Maastricht, Netherlands.) Nov. 1992 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0926-4493)
(MEMO-COSOR-92-47; ETN-94-94808) Avail: CASI HC A03

An integer linear programming formulation for the discrete lot sizing and scheduling problem is presented. This polynomial size formulation is obtained from the model with the natural variables by splitting these variables. Its linear programming relaxation is shown to be tight, by reformulating it as a shortest path problem. A dynamic programming formulation for the discrete lot sizing and scheduling problem is provided. Both the linear description and the dynamic programming recursion can be generalized to the multi-item case. The shortest path model then extends to an $(N + 1)$ dimensional network, N being the number of items. The model grows quickly with the number of items and the most practical way to use this formulation is to split a multi-item discrete lot sizing and scheduling problem in N single item problems and solve each with the linear program. The separation problem for the single item can also be modeled as a shortest path problem. By then, if any nonintegral variables are still left specific multi-item constraints may be added. ESA

ON THE ERROR COMMITTED BY STOPPING THE NEWTON ITERATION IN IMPLICIT RUNGE-KUTTA METHODS
M. N. Spijker Feb. 1993 16 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TW-93-02; ETN-94-94833) Avail: CASI HC A03

The numerical solution of initial value problems for nonlinear ordinary differential equations by implicit Runge-Kutta methods is considered. For stiff problems, Picard iteration is not appropriate and some variant of the Newton method is used. The problem of estimating the stopping error of Newton like iterations is discussed. An understanding of this error comparable to what is known about Picard iterations is obtained. Because of stiffness, the theory is more delicate than for Picard iterations. Various estimates of the Newton stopping errors are reviewed. The effect of these errors on the Runge-Kutta approximations to the solution of the given initial value problem is analyzed. Most of the error estimates established reflect order reduction phenomena in the presence of stiffness. This order reduction is confirmed by numerical experiments. ESA

ON THE ROBUSTNESS OF A MULTIPLE SEMI-COARSENED GRID METHOD
C. W. Oosterlee and P. Wesseling 1993 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0922-5641)
(Rept-93-51; ETN-94-95405; PB94-125309) Avail: CASI HC A03

The robustness of a non standard multigrid method called Multiple Semi-coarsened Grids (MSG) is investigated. The smoother is a damped point Jacobi relaxation method. Three different coarse grid correction strategies are implemented and compared. Roboustness is investigated by solving the rotated anisotropic diffusion equation and the convection diffusion equation. Good convergence results are obtained for the reference problems, the rotated anisotropic diffusion equation and the convection diffusion equation, solved with MSG on a very fine mesh. Interesting future developments will be the investigation for three dimensional problems and the investigation of the performance on a massive parallel computer. ESA

The symplectic structures (brackets, hamilton's equations and Lagrange's equations) for Dirac electron and its classical model have exactly the same form. We give explicitly the Poisson brackets in the dynamical variables (chi(sup mu), p(sup mu), nu(sup nu), S(sup mu nu)). The only difference is in the normalization of Dirac velocities gamma(sub mu)(gamma(sup mu)) = 4 which has significant consequences. DOE

CONTINUATION AND MULTI-GRID FOR BIFURCATION PROBLEMS Final Report, 1 Dec. 1989 - 15 Aug. 1993
Hans D. Mittelmann 31 Dec. 1993 13 p
(Grant AF-AFOSR-0080-90)
(AD-A274965; AFOSR-94-0018TR) Avail: CASI HC A03/MF A01

An overview is given of the work completed under grant AFOSR-90-0080 since December 1989. The research concerned the numerical solution of bifurcation and nonlinear eigenvalue problems for parameter-dependent partial differential equations and systems. The scope of the research is rather wide, stressing the development, study, and implementation of computational methods for several classes of difficult nonlinear problems, but also including the derivation of analytic results in cases where these questions had not been settled before. This grant was a continuation and extension of grant AFOSR-84-315. The earlier grant has resulted in 26 papers over a five-year period. The present grant resulted in the publication of 18 papers in refereed journals or refereed high-quality proceedings volumes and of one book. Several of the 26 papers generated under the earlier grant were listed as to appear in the final report for that grant. They all have appeared but are not listed here again. Instead, for simplicity, the papers and books produced under the present grant are referred to by giving the corresponding number in the list of all publications which is a part of the attached curriculum vitae. WINDING NUMBERS IN HOMOTOPY THEORY FROM INTEGERS TO REALS

M. Mekhfi Jul. 1993 12 p
(DE94-601510; IC-93/223) Avail: CASI HC A03/MF A01 (US Sales Only)

In Homotopy Theory (HT), we define paths on a given topological space. Closed paths prove to be construction elements of a group (the fundamental group) Pi(sub 1) and carry charges, the winding numbers. The charges are integers as they indicate how many times closed paths encircle a given hole (or set of holes). Open paths, as they are defined in (HT), do not possess any groups structure and as such they are less useful in topology. In the present paper, we enlarge the concept of a path in such a way that both types of paths do possess a group structure. In this broad sense we have two fundamental groups the Pi(sub i) = Z group and the SO(2) group of rotations but the latter has the global property that there is no periodicity in the rotation angle. There is also two charge operators W and W(sub lambda) whose eigenvalues are either integers or reals depending respectively on the paths being closed or open. Also the SO(2) group and the real charge operator, W(sub lambda), are not independently defined but directly related respectively to the Pi(sub i) group and to the integer charge operator W. Thus, well defined links can be established between seemingly different groups and charges. DOE

NUMERICAL SOLUTION OF SINGULARITY-PERTURBED TWO-POINT BOUNDARY-VALUE PROBLEMS
R. W. P. Masenge Jul. 1993 11 p
(DE94-601542; IC-93/209) Avail: CASI HC A03/MF A01 (US Sales Only)

Physical processes which involve transportation of slowly diffusing substances in a fast-flowing medium are mathematically modelled by so-called singularly-perturbed second order convection diffusion differential equations in which the convective first order terms dominate over the diffusive second order terms. In general, analytical solutions of such equations are characterized by having sharp solution fronts in some sections of the interior and/or the boundary of the domain of solution. The presence of these (usually very narrow) layer regions in the solution domain makes the task of globally approximating such solutions by standard numerical techniques very difficult. In this expository paper we use a simple one-dimensional prototype problem as a vehicle for analysing the nature of the numerical approximation difficulties involved. In the sequel, we present, without detailed derivation, two practical numerical schemes which succeed in varying degrees in numerically resolving the layer of the solution to the prototype problem. QUANTUM HAMILTONIAN DIFFERENTIAL GEOMETRY: HOW DOES QUANTIZATION AFFECT SPACE?
R. Aldrovandi Jan. 1993 52 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634306; IFT-P-004/93) Avail: CASI HC A04 (US Sales Only)

Quantum phase space is given a description which entirely parallels the usual presentation of Classical Phase Space. A particular Schwinger unitary operator basis, in which the expansion of each operator is its own Weyl expression, is specially convenient for the purpose. The quantum Hamiltonian structure obtains from the classical structure by the conversion of the classical pointwise product of dynamical quantities into the noncommutative star product of Wigner functions. The main qualitative difference in the general structure is that, in the quantum case, the inverse symplectic matrix is not simply antisymmetric. This difference leads to the presence of braiding in the backstage of Quantum Mechanics. DOE

RECONSTRUCTION OF MULTIPLE CRACKS FROM EXPERIMENTAL ELECTROSTATIC BOUNDARY MEASUREMENTS Final Report
Kurt Bryan (Rose-Hulman Inst. of Tech., Terre Haute, IN.), Valdis Liepa (Michigan Univ., Ann Arbor.), and Michael Vogelius (Rutgers Univ., New Brunswick, NJ.) Dec. 1993 31 p Submitted for publication
(Contracts NAS1-18605; NAS1-19480; NSF DMS-92-02042; RTOP 505-90-52-01)
(NASA-CR-191584; NAS 1.26:191584; ICASE-93-96) Avail: CASI HC A03/MF A01

An algorithm for recovering a collection of linear cracks in a homogeneous electrical conductor from boundary measurements of voltages induced by specified current fluxes is described. The technique is a variation of Newton's method and is based on taking weighted averages of the boundary data. An apparatus that was constructed specifically for generating laboratory data on which to test the algorithm is also described. The algorithm is applied to a number of different test cases and the results are discussed. Author (revised)

COLOUR OBJECT RECOGNITION M.S. Thesis
G. D. Finlayson Apr. 1992 82 p
(ISBN-0-315-83684-9; CTN-94-61033) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Since color characterizes local surface properties and is largely viewpoint insensitive, it is a useful cue for object recognition. A simple color indexing scheme that identifies objects by matching color-space histograms fails if the intensity or spectral characteristics of the incident illuminant varies. Two strategies for rectifying this failure are examined. A color constancy transform is first applied to each image prior to color indexing. Several color constancy algorithms are reviewed and in almost all cases it is concluded that their assumptions are too limiting. The exception, a discrete implementation of Forsyth's CRULE, successfully solves the color constancy problem for sets of simple objects viewed under constant illumination. To circumvent the need for color constancy preprocessing and to recognize more complex object sets, indexing on illuminant invariants (volumetric, ratio, and opponent) is considered. An algorithm is developed which identifies objects by matching color ratio-space histograms. In general, this algorithm performs comparably with color indexing under fixed illumination, but substantially better than color indexing under varying illumination. Author (CISTI)

A NUMERICAL SOLUTION TO THE ONE AND TWO DIMENSIONAL LINE RADIATIVE TRANSFER EQUATION Ph.D. Thesis
Erik Griffioen Jul. 1993 149 p
(ISBN-0-315-84258-X; CTN-94-61031) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A new, simple, and powerful technique for solving radiative transfer problems has been developed and coded for a two level (bound state) atom in one- and two-dimensional Cartesian coordinate systems. Scattering is assumed to be isotropic in angle, with either monochromatic or complete frequency redistribution (CFR), and has been broadened to include angle averaged frequency redistribution (AAFR). The formal solution is based on the lambda operator method. For optically thick scattering media, convergence is very slow using straight lambda iteration. Rapid and robust convergence is attained using an intermediate operator which is readily evaluated. Linear extrapolation based on previous iterates increases the convergence rate further. The one-dimensional model intensity versus frequency profiles are found to compare favorably with those using other proven models. Two-dimensional results are presented in terms of an auroral source in an optically thick scattering isothermal medium. The effect of angle quadrature, auroral source location, CFR versus AAFR, and conservative versus nonconservative scattering on the results are explored. The effect of lateral spreading of the OI 1304 A triplet auroral emissions in the Earth's thermosphere has been modelled and was found to be quite significant. Author (CISTI)

SIMULATION DYNAMICS OF A MULTIBODY CHAIN: RECURSION BASED ON CHAIN MODAL COORDINATES M.S. Thesis
Anne Marie Christine Bornath 1993 85 p
(ISBN-0-315-83555-9; CTN-94-61040) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A computer implementation of a new method for the solution of the simulation dynamics of a chain of bodies is presented. The simulation dynamics was developed by D'Eleuterio and utilizes chain coordinates and the implementation uses the LSODE software package and a finite element procedure. The algorithm is recursive in the sense that it deals with the rigid coordinates on a body-by-body basis and then solves for the elastic coordinates as an additional step. The computer code is applicable to chains of rigid and/or flexible bodies connected by joints of up to three rotational degrees of freedom. Numerical results of applying the procedure to an example manipulator similar to the space shuttle Canadarm are presented. These results are compared to numerical results obtained from an implementation of a recursive algorithm based on body modes. This comparison shows that the new method allows fewer elastic degrees of freedom to be used without a significant loss in accuracy of the results. The use of fewer elastic coordinates is accompanied by a significant reduction in computational time required. Thus the chain coordinate method is a potential improvement over existing procedures. LOCAL UNIFORM GRID REFINEMENT AND SYSTEMS OF COUPLED PARTIAL DIFFERENTIAL EQUATIONS

Ron A. Trompert Mar. 1993 32 p
(ISSN 0169-0388)
(CWI-NM-R9307; ETN-94-95411) Copyright Avail: CASI HC A03/MF A01

An adaptive grid method based on local uniform grid refinement applied to systems of coupled time dependent PDE's (Partial Differential Equations) is considered. Local uniform grid refinement means that the PDE's are solved on a series of nested, uniform, increasingly finer subgrids which cover only a part of the domain. These subgrids are created up to a level of refinement where sufficient spatial accuracy is obtained and their location and shape is adjusted after each time step in order to follow the moving steep fronts. When a system of coupled PDE's is solved, the behavior of the local and global error associated with each separate PDE can be very different from one PDE to another. A refinement strategy based on a global error analysis, which takes these differences into account, was developed. This refinement strategy aims at the domination of the global space error by the space discretization error at the finest subgrid. ESA

SEMANTICS, ORDERINGS AND RECURSION IN THE WEAKEST PRECONDITION CALCULUS

Marcello Bonsangue and Joost N. Kok (Utrecht State Univ., Netherlands.) Dec. 1992 61 p Sponsored in part by Milan Univ., Italy, and CNR
(ISSN 0169-118X)
(CWI-CS-R9267; ETN-94-95419) Copyright Avail: CASI HC A04/MF A01

An extension of Dijkstra's guarded command language is studied, including sequential composition, demonic choice and a backtrack operator. Three orderings on this language are considered: a refinement ordering defined by Back, a deadlock ordering, and an approximation ordering of Nelson. The deadlock ordering is in between the two other orderings. All operators are monotonic in Nelson's ordering, but backtracking is not monotonic in Back's ordering and sequential composition is not monotonic for the deadlock ordering. At first sight recursion can only be added using Nelson's ordering. By extending the theory of fixed points in partial orderings, it is shown that, under certain circumstances, least fixed points for non monotonic functions can be obtained by iteration from the least element. This permits the addition of recursion even using Back's ordering or the deadlock ordering. In order to give a semantic characterization of the three orderings that relates initial states to possible outcomes of the computation, the relations between predicate transformers and discrete powerdomains are studied. Three powerdomains are considered: two versions of the Smyth powerdomain and the Egli-Milner powerdomain. For each of them an isomorphism is proved with a suitable domain of predicate transformers. SIMPLE CURRENTS VERSUS ORBIFOLDS WITH DISCRETE TORSION: A COMPLETE CLASSIFICATION

M. Kreuzer (European Organization for Nuclear Research, Geneva, Switzerland.) and A. N. Schellekens 1993 28 p
(NIKHEF-H/93-13; CERN-TH.6912/93; ETN-94-95045) Avail: CASI HC A03/MF A01

Simple current modular invariants, extending results for (Z(sub p))(sup k) to arbitrary centers are classified. An explicit formula for the most general case is obtained. Using orbifold techniques, a one to one correspondence between simple current invariants and subgroups of the center with discrete torsions is found. The conjectured monodromy independence of the total number of such invariants is proven. The orbifold approach works in a straightforward way for symmetries of odd order. Modifications are required to deal with symmetries of even order. With these modifications the orbifold construction with discrete torsion is complete within the class of simple current invariants. NESTED KRYLOV METHODS BASED ON GCR

E. deSturler 1993 28 p Sponsored by Shell Research B.V., Netherlands, and STIPT
(ISSN 0922-5641)
(PB94-125317; Rept-93-50; ETN-94-95404) Copyright Avail: CASI HC A03/MF A01

The GMRESR method for the solution of linear systems of equations is presented. The GMRESR involves an inner and an outer method. The outer method is GCR, which is used to compute the optimal approximation over a given set of direction vectors in the sense that the residual is minimized. The inner method is GMRES, which at each step computes a new direction vector by approximately solving the residual equation. This direction vector is then used by the outer algorithm to compute a new approximation. The optimality of the approximation over the space of search directions is ignored in the inner GMRES algorithm. This leads to suboptimal corrections to the solution in the outer algorithm. The orthogonality relations of GCR in the inner GMRES algorithm is preserved. Some of the Krylov method properties are discussed. The results show that in terms of matrix vector multiplications this modification always leads to better convergence. Because of the additional orthogonalizations, it does not always give an improved performance in time. The experimental results indicate, that especially for such methods it is advantageous to preserve the orthogonality in the inner method. ESA

THREE DIMENSIONAL OBJECT RECOGNITION USING A COMPLEX AUTOREGRESSIVE MODEL M.S. Thesis

David E. Chelen Dec. 1993 112 p
(AD-A274388; AFIT/GE/ENG/93D-04) Avail: CASI HC A06/MF A02

Based on an autoregressive model, Complex Partial Correlation (CPARCOR) features are known to provide exceptional Position, Scale, and Rotation Invariant (PSRI) properties for planar 2-dimensional (2-D) object recognition. Although autogressive models have been successfully applied to numerous spatio-temporal recognition tasks, the effects of out-of-plane image rotations were never considered. This study investigates application of the CPAR-COR model to a five class problem of nonplanar 2-D views of 3-D objects. Recognition based on CPAR-COR features is evaluated using a Template Matching algorithm, two K-Nearest-Neighbor (KNN) classifiers, and a Hidden Markov Model (HMM). Direct comparisons to recognition based on Fourier features are made. Results indicate that the CPAR-COR model parameters provide useful shape-features for recognition of out-of-plane rotations. Displaying exceptional PSRI properties, the features are shown capable of classification by simple nonadaptive recognition schemes. Relatively successful results are obtained for a variety of tests. The advantage of classification by a multiple-look technique over the traditional single-look method is clearly demonstrated. Feature space crowding is noted as the cause of unusual recognition rates for occluded-view tests. Although general trends are noted, optimal model order and selection of CPARCOR versus Fourier features are considered application dependent. DTIC

COMMUNICATION COMPLEXITY OF t-INTERSECTION PROBLEMS IN GENERALIZED BOOLEAN ALGEBRAS
U. Faigle, W. Kern, and B. Spieker Jun. 1993 20 p
(PB94-126646; MEMO-1141) Avail: CASI HC A03/MF A01

The following game is considered: Two players independently choose a chain in a partially ordered set. How many bits of information have to be communicated until at least one of the players knows whether the chains have exactly t elements in common? This model generalizes the t-intersection problem for subsets of a finite set. The deterministic communication complexity is established in general. For the special cases of generalized Boolean algebras, improved nondeterministic and probabilistic protocols are presented that are of optimal order of complexity for classes with fixed width q. AN OPTIMAL CONSTRAINED LINEAR INVERSE METHOD FOR MAGNETIC SOURCE IMAGING
P. Hughett Sep. 1993 42 p
(Contract DE-AC03-76SF-00098)
(DE94-002264; LBL-34512) Avail: CASI HC A03/MF A01

Magnetic source imaging is the reconstruction of the current distribution inside an inaccessible volume from magnetic field measurements made outside the volume. If the unknown current distribution is expressed as a linear combination of elementary current distributions in fixed positions, then the magnetic field measurements are linear in the unknown source amplitudes and both the least square and minimum mean square reconstructions are linear problems. This offers several advantages: The problem is well understood theoretically and there is only a single, global minimum. Efficient and reliable software for numerical linear algebra is readily available. If the sources are localized and statistically uncorrelated, then a map of expected power dissipation is equivalent to the source covariance matrix. Prior geological or physiological knowledge can be used to determine such an expected power map and thus the source covariance matrix. The optimal constrained linear inverse method (OCLIM) derived in this paper uses this prior knowledge to obtain a minimum mean square error estimate of the current distribution. OCLIM can be efficiently computed using the Cholesky decomposition, taking about a second on a workstation-class computer for a problem with 64 sources and 144 detectors. Any source and detector configuration is allowed as long as their positions are fixed a priori. Correlations among source and noise amplitudes are permitted. OCLIM reduces to the optimally weighted pseudo-inverse method of Shim and Cho if the source amplitudes are independent and identically distributed and to the minimum-norm least squares estimate in the limit of no measurement noise or no prior knowledge of the source amplitudes. In the general case, OCLIM has better mean square error than either previous method. OCLIM appears well suited to magnetic imaging, since it exploits prior information, provides the minimum reconstruction error, and is inexpensive to compute. DOE

SOME PROPERTIES OF GRAPHS WITH LOCAL ORE CONDITIONS
A. S. Asratian Jun. 1993 16 p Sponsored by Nederlandse Organisatie voor Wetenschappelijk Onderzoek, The Hague Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-126612; MEMO-1140) Avail: CASI HC A03

It is shown that a connected graph G of order at least 3 is hamiltonian if for each vertex x the subgraph G(sub 1)(x) induced by x and its neighbors in G is an Ore graph. We prove here that a graph G satisfying the above conditions is fully cycle extendable. Moreover, G is panconnected if and only if G is 3-connected and G does not = K(sub n) (joint operation symbol) (bar-K(sub n)) for some n greater than or equal to 3. The paper is concluded with two conjectures. NTIS

A NON-LINEAR MATHEMATICAL MODEL OR FINITE, PERIODIC RAIL CORRUGATIONS
J. Piotrowski (Warsaw Univ., Poland.) and J. J. Kalker 1993 16 p
(ISSN 0922-5641)
(Rept-93-49; ETN-94-95403) Copyright Avail: CASI HC A03/MF A01

A nonlinear mathematical model of rail corrugations which takes into account nonlinear contact mechanical and geometrical properties of wheel/rail contact is presented. The contact area is approximated by an ellipse and a steady state rolling contact code is used for the description of creep forces. The preliminaries of a theory in which nonlinearity of the contact problem is fully taken into account are summarized. The following aspects are considered: the contact formation on sinusoidal corrugation in its dependence on load and position; the corrugation formation taking place as a consequence of abrasive wear, which is assumed linearly proportional to the frictional work performed in the contact area. THE MORPHOLOGICAL PROCESSING OF BINARY IMAGES Interim Report, Sep. 1991 - Feb. 1993
Dennis W. McGuire Oct. 1993 70 p
(AD-A274310; ARL-TR-283) Avail: CASI HC A04/MF A01

The morphological processing of binary images is treated in depth from the viewpoint of ordered topology. The basic ideas of Nachbin arid Birkhoff concerning when a partial ordering of a set that has a topology is compatible with that topology are used to obtain a definition of an order resolvable topological ordered space. This abstraction is then used to define semicontinuity in a sufficiently general way to unify its treatment in mathematical morphology. This is followed by a detailed review of the basic concepts of closed-set morphology. In this review, a more thorough treatment than is available elsewhere is given of the several limit concepts used in morphology; likewise, the continuity properties of the erosion, dilation, and homothesis operations are more thoroughly treated than is usual. The morphological transformation and transformation space theory of closed-set morphology is presented in a systematic way that incorporates the relevant contributions of Matheron and Maragos, as well as the recent important work of Banon and Barrera. Finally, a class of countable closed-set bases for the underlying hit-miss topology is used to derive a novel representation of morphological transformations. DTIC

A Lie bialgebra structure on the central extension of the Lie algebra of differential operators on the line and the circle (with scalar or matrix coefficients) is introduced. This defines a Poisson-Lie structure on the dual group of pseudodifferential symbols of an arbitrary real (or complex) order. It was shown that the usual (second) Benney, GL(sub n)-KdV (or GL(sub n)-Adler-Gelfand-Dickey) and KP Poisson structures are naturally realized as restrictions of this Poisson structure to submanifolds of this 'universal' Poisson-Lie group. Moreover, the reduced (= SL(sub n)) versions of these manifolds (or W(sub n)-algebras in physical terminology) can be viewed as certain subspaces of the quotient of this Poisson-Lie group by the dressing action of the group of functions on the circle (or as a result of a Poisson reduction). Finally, an infinite set of commuting functions on this Poisson-Lie group that give the standard families of Hamiltonians when restricted to the submanifolds mentioned above are defined. The Poisson structure and Hamiltonians on the whole group interpolate between the Poisson structures and Hamiltonians of Benney, KP, and KdV flows. We also discuss the geometrical meaning of W(sub infinity) as a limit of Poisson algebras W(sub epsilon) when epsilon approached 0. NTIS

NECESSARY AND SUFFICIENT CONDITIONS FOR THE EXISTENCE OF THE STABILIZING SOLUTION OF THE RICCATI EQUATION IN A HILBERT SPACE: A POPOV FUNCTION APPROACH
Martin Weiss 1993 30 p
(PB94-125341; W-9311) Avail: CASI HC A03/MF A01

A necessary and sufficient condition was given for the existence of the stabilizing solution of a general Riccati equation in an abstract Hilbert space setting where the input operators are assumed to be bounded. This result allowed an extension of a known criterion for J-spectral factorizations. Two particular cases are then considered. Both cases enjoy the property that the solutions to the Riccati equations have an 'optimality' property. The first case is related to the well-known Positivity Theorem and gives the solution to the LQ problem. The second case is shown to give the solution to a max-min quadratic problem. A sufficient condition was given for existence of a positive stabilizing solution of the Riccati equation in this second case. As an application, a central result in H(infinity)-control theory was re-derived. NTIS

GRID-INDEPENDENT CONVERGENCE BASED ON PRECONDITIONING TECHNIQUES
A. VanderPloeg, E. F. F. Botta, and F. W. Wubs 1994 35 p
(PB94-125358; W-9310) Avail: CASI HC A03/MF A01

A preconditioning technique is described which shows grid-independent convergence when combined with any conjugate gradient-like method. This technique is relatively easy to implement. Only an incomplete LU-decomposition of A has to be made. Essential to the method is the choice of a drop tolerance controlling the size of R = A - LU and the ordering of the unknowns. The ordering is similar to that in multigrid approaches and makes it possible to construct an incomplete LU-decomposition which can be used in eliminating effectively both high- and low-frequency errors. For model problems, an expression for the drop tolerance has been derived such that the condition number of the preconditioned matrix does not depend on the dimension of the system. Similar expressions for less trivial problems seem to be possible. The method is tested on a variety of well-known elliptic test problems described in the literature. These include strongly varying coefficients, advective terms, and grid refinement. In all cases, the method is much cheaper than standard ICCG. NTIS

ROLE OF ANTICAUSAL INVERSES IN MULTIRATE FILTER-BANKS. PART 1: SYSTEM THEORETIC FUNDAMENTALS
P. P. Vaidyanathan and Tsuhan Chen Sep. 1993 33 p
(Contract N00014-93-1-0231)
(AD-A274279) Avail: CASI HC A03/MF A01

In a maximally decimated filter bank with identical decimation ratios for all channels, the perfect reconstructibility properties depend on the properties of the polyphase matrix. Various properties and capabilities of the filter bank depend on the properties of the polyphase matrix as well as the nature of its inverse. A study of the types of inverses was undertaken and they were characterized according to their system theoretic properties (i.e., properties of state-space descriptions, McMillan degree, degree of determinant, and so forth). It was found in particular that causal polyphase matrices with anticausal inverses have an important role in filter bank theory. Their properties both for the FIR and IIR cases were studied. Techniques for implementing anticausal IIR inverses based on state space descriptions are outlined. It is found that causal FIR matrices with anticausal FIR inverses (abbreviated cafacafi) have a key role in the characterization of FIR filter banks. In a companion paper these results are applied for the factorization of biorthonormal FIR filter banks, and a generalization of the lapped orthogonal transform called the biorthonormal lapped transform (BOLT) developed. Q - DIFFERENCE INTERTWINING OPERATORS FOR A LORENTZ QUANTUM ALGEBRA
L. Dabrowski (International School for Advanced Studies, Trieste, Italy.), V. K. Dobrev, and R. Floreanini (Istituto Nazionale di Fisica Nucleare, Trieste, Italy.) Jun. 1993 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-602559; IC-93/159; UTS-DFT-17-93; SISSA-92/93/FM) Avail: CASI HC A03 (US Sales Only)

The authors construct representations pi-circumflex(sub r, r) of a Lorentz quantum algebra U labelled by two complex numbers r, r and acting in the space of formal power series of two non-commuting variables eta, eta. These variables are built from elements of the matrix Lorentz quantum group L which is dual to U. The conditions for reducibility of pi-circumflex(sub r, r) are given. The authors construct explicitly q - difference intertwining operators in eta, eta-bar which realize partial equivalencies of the representations pi-circumflex(sub r, r). The whole construction is a generalization of a known procedure for q = 1. The case when q is a root of unity is also considered in detail. DOE

BIFURCATION SEQUENCES AT 1:4 RESONANCE: AN INVENTORY
Bernd Krauskopf 1994 30 p
(PB94-125408; W-9308) Avail: CASI HC A03/MF A01

The problem of 1:4 resonance of a closed orbit of a vector field in R(sup 3) leads to the study of the Z(sub 4)-equivariant planar vector field, in complex notation, z-dot = e(sup i*alpha)*z + A*z*(absolute value of z)(exp 2) + z-bar(exp 3), where A is a member of C and alpha is a member of R are parameters. This system has been studied in other papers. The parameter A-plane is divided in at least 48 different regions with topologically different bifurcation sequences under variation of the parameter alpha. An inventory of computer generated pictures of the bifurcation sequences is presented. In contrast to sketches, the pictures show the physical appearance of the system. For example, some limit cycles are square-shaped and some saddle-node bifurcations are cusp-like. The knowledge of these interesting features can stimulate further research. They are discussed along with the problems of the computation. NTIS

The paper studies L-infinity-norm approximations from a space spanned by a discrete set of translates of a basis function theta. Attention here is restricted to functions phi whose Fourier transform is smooth and has a singularity at the origin. Examples of such basis functions are the thin-plate splines and the multiquadrics, as well as other types of radial basis functions that are employed in Approximation Theory. The above approximation problem is well-understood in case the set of points used for translating theta forms a lattice, and many optimal and quasi-optimal approximation schemes can already be found in the literature. In contrast, only few, mostly specific, results are known for a set of scattered points. The main objective of this paper is to provide a general tool for extending approximation schemes that use integer translates of a basis function to the non-uniform case. We introduce a single, relatively simple, conversion method that preserves the approximation orders provided by a large number of schemes presently in the literature (more precisely, to almost all stationary schemes). In anticipation of future introduction of new schemes for uniform grids, an effort is made to impose only a few mild conditions on the function theta, which still allow for a unified error analysis to hold. In the course of the discussion here, the recent results of BuDL on scattered center approximation are reproduced and improved upon. DTIC

(PB94-124302; RAL-93-064) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

We describe the design, implementation, and performance of a frontal code for the solution of large sparse unsymmetric systems of linear equations. The resulting software package, MA42, is included in Release 11 of the Harwell Subroutine Library and is intended to supersede the earlier MA32 package. We discuss in detail design changes from the earlier code indicating the way in which they aid clarity, maintainability, and portability. The new design also permits extensive use of higher level BLAS (Basic Linear Algebra Subprograms) kernels, which aid both modularity and efficiency. We illustrate the performance of our new code on practical problems on a CRAY Y-MP, an IBM 3090, and an IBM RISC System/6000. We indicate some directions for future development. NTIS

Algebraic numbers commonly arise in the solution of polynomial equations and in many integration problems. As these are quite common problems in symbolic computation, it is necessary to have efficient algorithms for dealing with algebraic numbers symbolically. Many standard algorithms for working with algebraic numbers are quite slow. The problems of detecting dependencies between algebraic numbers and computation of algebraic number polynomial greatest common divisors are addressed, and a method for efficiently detecting all dependencies between unnested radicals is presented. A new modular heuristic method for doing operations in algebraic number fields is then given. This method can be used for most polynomial operations involving algebraic numbers, but is most useful for calculating greatest common divisors. Techniques of using this method for factorization and for multiple extensions are discussed, as well as the way in which the heuristic can be used as an algorithm. Author (CISTI)

A new robust estimation technique for range image segmentation and fitting has been developed. Its performance has been improved considerably by incorporating a genetic algorithm (GA). The new robust estimation method randomly samples range image points and solves equations determined by these points for parameters of selected primitive type. From K samples a residual consensus (RESC) is measured by a compressed histogram method in order to choose one set of sample points which determines an equation best fitting the largest homogeneous surface patch in the current processing region. A boundary list searching method is used to extract the surface patch out of the processing region. The RESC method can tolerate over 80 percent outliers, segments range image into planar and quadratic surfaces, and works well even in smoothly connected curve regions. A GA was used to accelerate the random search. A large number of offline average performance experiments on GA's were conducted to examine different types of GA's and the influence of control parameters. A steady state GA was found to work better than a generational replacement GA. The algorithms have been validated on a large set of synthetic and real range images. Author (CISTI)

COMPUTATION OF NUMERICAL SOLUTION OF PARABOLIC PDES BY MONOTONE ITERATIVE METHODS M.S. Thesis

Ying Chen 1993 125 p
(ISBN-0-315-84553-8; CTN-94-61074) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

By using a weighted difference scheme and the method of upper-lower solutions proposed by Liu et al. to study elliptic differential equations, a monotone iteration scheme has been developed for the computation of solutions to nonlinear parabolic boundary initial value problems (NPBIVP) and coupled NPBIVP. In each iteration, it is only needed to solve a linear system of which the coefficient matrix is an M-matrix. The proposed scheme and method allows the nonlinearity of the first order partial differential terms which generalizes several previous results related to the same types of problems. In particular, the results presented cover Sattinger's 1972 results about the parabolic boundary initial value problem and some of Pao's 1982 results about the coupled parabolic boundary value problem. Examples are presented to illustrate the efficiency of implementation and applicability of the proposed scheme, as well as its convergence in a test problem. To keep computational costs reasonable, nonuniform grids in time and space can be used, but this will make programming more complicated. Author (CISTI)

SOLVING THE LINEAR QUADRATIC OPTIMAL CONTROL PROBLEM FOR INFINITE-DIMENSIONAL SYSTEMS M.S. Thesis

Janet Rose Grad 1993 197 p
(ISBN-0-315-84562-7; CTN-94-61075) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Solutions of the linear quadratic regulator (LQR) problem for infinite dimensional systems are considered. A sequence of approximating finite dimensional LQR problems is shown to converge under certain stabilizability assumptions. Rather than attempting to solve an infinite dimensional system, the problem is formulated in terms of this convergent sequence. An iterative method for computing the Riccati matrix and associated feedback gains is proposed. The method is based on mapping the feedback gains and Riccati matrix between successive approximating spaces. In this manner, prior information is conveyed to the next larger space and is used as an initial estimate for the current solution. Advantages of the proposed algorithm over the standard eigenvector approaches (Potter's method and the Laub-Schur method) are discussed and illustrated using two examples: control of the heat distribution in a one-dimensional rod and control of acoustic pressure in a two-dimensional cavity. The latter problem has physical applications in such fields as noise reduction in airplanes. Author (CISTI)

PARALLEL IMPLICIT UNSTRUCTURED GRID EULER SOLVERS Final Report

V. Venkatakrishnan Jan. 1994 21 p Submitted for publication
(Contracts NAS1-19480; NAS2-12961; RTOP 505-90-52-01)
(NASA-CR-191594; NAS 1.26:191594; ICASE-94-4) Avail: CASI HC A03/MF A01

A mesh-vertex finite volume scheme for solving the Euler equations on triangular unstructured meshes is implemented on an MIMD (multiple instruction/multiple data stream) parallel computer. An explicit four-stage Runge-Kutta scheme is used to solve two-dimensional flow problems. A family of implicit schemes is also developed to solve these problems, where the linear system that arises at each time step is solved by a preconditioned GMRES algorithm. Two partitioning strategies are employed, one that partitions triangles and the other that partitions vertices. The choice of the preconditioner in a distributed memory setting is discussed. All the methods are compared both in terms of elapsed times and convergence rates. It is shown that the implicit schemes offer adequate parallelism at the expense of minimal sequential overhead. The use of a global coarse grid to further minimize this overhead is also investigated. The schemes are implemented on a distributed memory parallel computer, the iPSC/860. Author

AGGLOMERATION MULTIGRID FOR THE THREE-DIMENSIONAL EULER EQUATIONS Final Report

V. Venkatakrishnan and D. J. Mavriplis Jan. 1994 29 p Submitted for publication
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191595; NAS 1.26:191595; ICASE-94-5) Avail: CASI HC A03/MF A01

A multigrid procedure that makes use of coarse grids generated by the agglomeration of control volumes is advocated as a practical approach for solving the three dimensional Euler equations on unstructured grids about complex configurations. It is shown that the agglomeration procedure can be tailored to achieve certain coarse grid properties such as the sizes of the coarse grids and aspect ratios of the coarse grid cells. The agglomeration is done as a preprocessing step and runs in linear time. The implications for multigrid of using arbitrary polyhedral coarse grids are discussed. The agglomeration multigrid technique compares very favorably with existing multigrid procedures both in terms of convergence rates and elapsed times. The main advantage of the present approach is the ease with which coarse grids of any desired degree of coarseness may be generated in three dimensions, without being constrained by considerations of geometry. Inviscid flows over a variety of complex configurations are computed using the agglomeration multigrid strategy. Author (revised)

In many science and engineering applications, there is an interest in predicting the outputs of a process for given levels of inputs. In order to develop a model, one could run the process, or a simulation of the process, at a number of points (a point would be one run at one set of possible input values) and observe the values of the outputs at those points. These observations can be used to predict the values of the outputs for other values of the inputs. Since the outputs are a function of the inputs, a surface in the space of possible inputs and outputs can be generated. This surface is called a response surface. In some cases, collecting data needed to generate a response surface can be very expensive. Thus, in these cases, there is a powerful incentive to minimize the sample size while building better response surfaces. One such case is the semiconductor equipment manufacturing industry. Semiconductor manufacturing equipment is complex and expensive. Depending upon the type of equipment, the number of control parameters may range from 10 to 30 with perhaps 5 to 10 being important. Since a single run can cost hundreds or thousands of dollars, it is very important to have efficient methods for building response surfaces. A current approach to this problem is to do the experiment in two stages. First, a traditional design, such as fractional factorial, is used to screen variables. After deciding which variables are significant, additional runs of the experiment are conducted. The original runs and the new runs are used to build a model with the significant variables. However, the original (screening) runs are not as helpful for building the model as some other points might have been. This paper presents a point selection scheme that is more efficient than traditional designs. DOE

ITERATIVE METHODS FOR THE WLS STATE ESTIMATION ON RISC, VECTOR, AND PARALLEL COMPUTERS
J. Nieplocha and C. C. Carroll (Alabama Univ., Tuscaloosa.) Oct. 1993 9 p Presented at the 1993 North American Power Symposium, Washington, DC, 11-12 Oct. 1993
(Contract DE-AC06-76RL-01830)
(DE94-004260; PNL-SA-23064; CONF-9310246-1) Avail: CASI HC A02/MF A01

The authors investigate the suitability and effectiveness of iterative methods for solving the weighted-least-square (WLS) state estimation problem on RISC, vector, and parallel processors. Several of the most popular iterative methods are tested and evaluated. The best performing preconditioned conjugate gradient (PCG) is very well suited for vector and parallel processing as is demonstrated for the WLS state estimation of the IEEE standard test systems. A new sparse matrix format for the gain matrix improves vector performance of the PCG algorithm and makes it competitive to the direct solver. Internal parallelism in RISC processors, used in current multiprocessor systems, can be taken advantage of in an implementation of this algorithm. DOE

The expressive power of process algebras is investigated in a general setting of Structural Operational Semantics (SOS). The notion of an effective operational semantics is introduced and it is observed that no effective operational semantics for an enumerable language can specify all effective process graphs up to trace equivalence. A natural class of Plotkin style SOS specifications is identified, containing the guarded versions of calculi like CCS (Calculus of Communicating Systems), SCCS, MEIJE and ACP, and it is proved that any specification in this class induces an effective operational semantics. Using techniques introduced by Bloom, it is shown that for the guarded versions of CCS like calculi, there is a double exponential bound on the speed with which the number of outgoing transitions in a state can grow. As a corollary of this result it follows that two expresiveness results of De Simone for MEIJE and SCCS depend in a fundamental way on the use of unguarded recursion. A final result is that all operators definable via a finite number of rules in a format due to De Simone, are derived operators in the simple Process Calculus (PC). ESA

NUMERICAL EXPERIMENT ON FINITE ELEMENT METHOD FOR MATCHING DATA
Shinji Tokuda, Toshimasa Kumakura, and Koichi Yoshimura Mar. 1993 37 p In JAPANESE; In JAPANAESE
(DE94-701208; JAERI-M-93-075) Avail: CASI HC A03/MF A01

Numerical experiments are presented on the finite element method by Pletzer-Dewar for matching data of an ordinary differential equation with regular singular points by using a model equation. Matching data play an important role in nonideal MHD stability analysis of a magnetically confined plasma. In the Pletzer-Dewar method, the Frobenius series for the 'big solution', the fundamental solution which is not square-integrable at the regular singular point, is prescribed. The experiments include studies of the convergence rate of the matching data obtained by the finite element method and of the effect on the results of computation by truncating the Frobenius series at finite terms. It is shown from the present study that the finite element method is an effective method for obtaining the matching data with high accuracy. DOE

ON THE LAGRANGIAN AND UPDATED LAGRANGIAN NONLINEAR FINITE ELEMENT FORMULATIONS Ph.D. Thesis
Abdelfattah Soliman 1990 138 p
(ISBN-0-315-61111-1; CTN-94-61002) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

An increasing demand for the solution of various engineering problems with geometric and/or material nonlinearities in such areas as metal forming and aircraft industries has contributed to the rapid growth in popularity of finite element methods. Of the various methods of formulation of those nonlinearities, the updated Lagrangian formulation is considered. The formulations are derived from the virtual work principle expressed in the current configuration, then transferred to the proper reference configuration. Explicit forms for the stiffness matrices are given in each case. It is shown that nonlinear stiffness matrices must be included in the formulations if they are to be consistent with the constitutive assumptions. The Lagrangian formulations are rederived in the rate form using the objective Jaumann stress-rate and the principal axes technique. Specific forms of constitutive equations for elastic and elastic-plastic material response are presented. The use of stress rates to derive acceptable constitutive equations is also discussed. The Lagrangian and updated Lagrangian rate formulations are expressed in incremental forms and used to solve three sample problems involving large deformation, large rotation, and large strain for elastic-plastic solids. THE DETERMINISTIC POWER-SPECTRAL-DENSITY-METHOD FOR NONLINEAR SYSTEMS
R. Noback 25 Aug. 1992 58 p
(Contract OV/RLD-132)
(AD-B179687; NLR-TP-92342-U) Avail: CASI HC A04/MF A01

The deterministic power spectral density (P.S.D.) method can be derived from the design envelope analysis of the continuous P.S.D. method. It provides a method to determine a deterministic function that gives a maximum response equal to the P.S.D. design load for linear systems. The P.S.D. design load is undefined for nonlinear systems. In this report a 'reasonable extrapolation' of the deterministic P.S.D. method has been proposed for nonlinear systems. Design loads for a simple nonlinear aircraft model have been calculated. The results have been compared with results obtained with a 'reasonable extrapolation' of the P.S.D method using simulation. Author (revised)

THE APPLICATION OF SIMULATED ANNEALING TO STOCHASTIC SYSTEMS M.S. Thesis
Charles B. Warrender 18 Nov. 1993 222 p
(AD-A273850; AFIT/GSO/ENS/93D-16) Avail: CASI HC A10/MF A03

Simulated Annealing was used to optimize three constrained simulation models. For each of these models, seven different acceptance functions were evaluated and compared against the performance of Local Search. These comparisons demonstrated the affect that different acceptance functions have on the performance of the algorithm. The performance was measured by the average solution quality and average efficiency obtained from several runs. The first model facilitated the implementation of Simulated Annealing using the SLAM simulation language. The configuration space was small, described by only two decision variables. It demonstrated the viability of using Simulated Annealing to optimize the variable settings in a simulation model. The second model, with six decision variables, provided greater insight to the advantages and limitations of Simulated Annealing. This model was implemented as an open queuing network. The third model, similar to the second, was implemented as a closed queuing network. The results from this variation were completely unexpected. They showed a wide performance separation among the different acceptance functions that was not present in the first two models. No attempt was made to justify the use of Simulated Annealing from a theoretical perspective. Rather, empirical results from the three models were used to infer the practical utility of the algorithm. DTIC

SET BASED ANALYSIS OF ARITHMETIC

Nevin Heintze Dec. 1993 19 p
(Contract F19628-91-C-0168)
(AD-A274112; CMU-CS-93-221) Avail: CASI HC A03/MF A01

Set based analysis is an approach to compile-time program analysis that is based on a simple approximation: all dependencies between variables are ignored. In effect, program variables are treated as sets of values. Thus far, set based analysis techniques have focussed on data-constructor languages. The main reason for this is algorithmic: the equality for data-constructor values is structural. This has important implications for how sets of such values can be represented during the computation of a set based analysis. In contrast, the equality theory of arithmetic is much richer. Two terms with very different structure can be equal. Correspondingly, the manipulation and representation of sets of arithmetic values is significantly more complex. In this paper, we extend the ideas of set based analysis to arithmetic expression in such a way that the analysis yields descriptions of how arithmetic values are computed. Importantly, this extended analysis yields useful information about the arithmetic components of a program while maintaining the efficiency of the basic set constraint approach. We show how this information can be exploited during compilation with two examples involving array bounds elimination. While this work is carried out in the context of the ML, the techniques developed appear to be applicable to other languages. DTIC

PROFICIENCY SCALING BASED ON CONDITIONAL PROBABILITY FUNCTIONS FOR ATTRIBUTES Final Report, Apr. 1989 - Aug. 1993

Kikumi Tatsuoka, Menucha Birenbaum, Charles Lewis, and Kathleen Sheehan Oct. 1993 72 p
(Contract N00014-90-J-1307; DA Proj. RR0-4204)
(AD-A273816; ETS-RR-93-50-ONR) Avail: CASI HC A04/MF A01

Procedures for constructing a proficiency scale for a large-scale test by applying Tatsuoka's Rule Space Model are introduced. The SAT Mathematics (SAT M), Section 2, is used for illustrating the process and the results. A task analysis is summarized in a mapping sentence, and then 14 processes and content attributes are identified for explaining the underlying cognitive aspects of the examinees' performance on the SAT M. Analysis results show that almost 98% of 2,334 examinees are successfully classified into one of 468 cognitive states. The cognitive states are characterized by mastery or non-mastery of the 14 attributes. Attribute Characteristic Curves, which are conditional probability functions defined on the SAT Scale, are introduced and used for interpreting an examinee's proficiency. Prototypes of a student's performance report and a group performance report are given as examples of possible ways for summarizing the analysis results. DTIC

MULTIPLE MODEL ADAPTIVE ESTIMATION APPLIED TO THE LAMBDA URV FOR FAILURE DETECTION AND IDENTIFICATION M.S. Thesis

David W. Lane 2 Dec. 1993 237 p
(AD-A274078; AFIT/GE/Eng/93D-23) Avail: CASI HC A11/MF A03

Multiple Model Adaptive Estimation (MMAE) is a method of estimating unknown system parameters by modeling all possible parameter configurations in several models. The parameters for this research are failure status conditions associated with flight control actuators and sensors on the LAMBDA Unmanned Research Vehicle. The LAMBDA URV is an experimental aircraft operated by Wright Laboratory Flight Controls Division at Wright-Patterson Air Force Base, Ohio. Six actuator failures and eight sensor failures are modeled, along with the fully functional aircraft, in fifteen elemental Kalman filters. These filters propagate and update their own aircraft state estimates in real time. A probability computation representing the likelihood of each elemental filter's match to the true condition of the aircraft is used to generate relative probabilities for each filter's hypothesis. In this research, the MMAE algorithm is extended for the identification of dual failures through the use of a hierarchical structure of filter banks. The ability of the MMAE to identify dual failures in the face of wind gust uncertainty and sensor noise is investigated. Aircraft state excitation is required for effective MMAE performance. Therefore, the form of an optimal input dither signal is derived through extensive experimentation. Dither signals are applied to the command inputs of a Quantitative Feedback Theory flight control system which controls pitch rate, roll rate, and sideslip angle. In particular, the MMAE performance is studied as sinusoidal dither inputs are varied in frequency and magnitude. An analysis of tuning techniques for the elemental filters within the MMAE is presented. DTIC

ACCURACY ANALYSIS OF MULTI-AXIS MACHINES Ph.D. Thesis

Johannes Augustinus Soons 1993 220 p
(ETN-94-95341) Avail: CASI HC A10/MF A03

A general strategy to estimate and describe the quasi static errors of multi axis machines is presented. The goal is a model for the errors in the position and orientation of the end effector relative to the workpiece during an arbitrary task. A model of the machine errors is developed. The unknown parameters in this model are estimated using artifact measurements. The model is verified by simulating and compensating the machine errors. The modeling strategy is applied to a five axis milling machine and a three axis coordinate measuring machine. For the milling machine, the models for the geometric and finite stiffness errors are validated by predicting the errors of hole plate measurements executed by the machine. The models for the thermal errors are validated by predicting the observed zero point drift of the tool during characteristic duty cycles of the spindle. The accuracy of the machine is improved by software error compensation of the geometric errors. The geometric errors of the coordinate measuring machine are estimated by three different methods, all using length measurements. The respective models are validated by predicting the observed errors of a large number of length measurements executed by the machine. ESA

ISOTONIC ESTIMATION AND RATES OF CONVERGENCE IN WICKSELL'S PROBLEM

Piet Groeneboom and Geurt Jongbloed 1993 28 p
(ISSN 0922-5641)
(Rept-93-39; ETN-94-95394) Copyright Avail: CASI HC A03/MF A01

It is shown that, in the nonparametric setting for the so-called Wicksell problem, the distribution function of the squared radii of the balls cannot be estimated at a rate faster than (1/square root of n)(square root of log n). An isotonic estimator of the distribution function which attains this rate is presented. Its asymptotic distribution is derived. It is shown that the variance of this limiting distribution is exactly half the asymptotic variance of the naive plug-in estimator. The violation of both monotonicity and the range constraints for distribution functions by the estimators are discussed. An isotonized naive estimator is defined. ESA

PARAMETER ESTIMATION FOR ARMA MODELS WITH INFINITE VARIANCE INNOVATIONS
Thomas Mikosch, Tamar Gadrich, Claudia Kluppelberg, and Robert J. Adler 30 Dec. 1993 40 p
(Contract N00014-89-J-1870)
(AD-A274654) Avail: CASI HC A03/MF A01

We consider a standard ARMA process of the form phi(B)X(sub t) = Theta(B)Z(sub t), where the innovations Z(sub t) belong to the domain of attraction of a stable law, so that neither the Z(sub t) nor the X(sub t) have a finite variance. Our aim is to estimate the coefficients of phi and theta). Since maximum likelihood estimation is not a viable possibility (due to the unknown form of the marginal density of the innovation sequence) we adopt the so-called Whittle estimator, based on the sample periodogram of the X sequence. Despite the fact that the periodogram does not, a priori, seem like a logical object to study in this non-L' situation, we show that our estimators are consistent, obtain their asymptotic distributions, and show that they converge to the true values faster than in the usual L2 case. WINDOW LEAST SQUARES METHOD APPLIED TO STATISTICAL NOISE SMOOTHING OF POSITRON ANNIHILATION DATA
Gh. Adam, S. Adam, B. Barbiellini (Geneva Univ., Switzerland.), L. Hoffmann (Geneva Univ., Switzerland.), A. A. Manuel (Geneva Univ., Switzerland.), and M. Peter (Geneva Univ., Switzerland.) Jun. 1993 40 p
(DE93-634665; IC-93/146) Avail: CASI HC A03/MF A01 (US Sales Only)

The paper deals with the off-line processing of experimental data obtained by two-dimensional angular correlation of the electron-positron annihilation radiation (2D-ACAR) technique on high-temperature superconductors. A piecewise continuous window least squares (WLS) method devoted to the statistical noise smoothing of 2D-ACAR data, under close control of the crystal reciprocal lattice periodicity, is derived. Reliability evaluation of the constant local weight WLS smoothing formula (CW-WLSF) shows that consistent processing 2D-ACAR data by CW-WLSF is possible. CW-WLSF analysis of 2D-ACAR data collected on untwinned Y Ba2Cu3O(7-delta) single crystals yields a significantly improved signature of the Fermi surface ridge at second Umklapp processes and resolves, for the first time, the ridge signature at third Umklapp processes. SUBGRAPH APPROXIMATIONS FOR LARGE DIRECTED GRAPHICAL MODELS
Constantin T. Yiannoutsos and Alan E. Gelfand 27 Sep. 1993 39 p
(Contract N00014-92-J-1264)
(AD-A274813; TR-473) Avail: CASI HC A03/MF A01

Graphical Models provide a powerful tool for the formulation of general statistical models. In a previous paper, the authors argued that sampling-based techniques provide a unified approach for the analysis of graphical models under general distributional specifications. These techniques include both noniterative and iterative Monte Carlo. Our concern here is with very large graphical models whose size and complexity may prohibit analysis within a reasonable time frame. Typically in large systems, however, interest focuses on the behavior of only a few critical nodes. Our proposal is to develop, for a particular node, an approximating subgraph which contains virtually as much information about the variable as the full network, but by virtue of its reduced size, enables rapid computational investigation. We provide an illustration using a 40-node graph. Though this is not as large as we would envision in practice, it is convenient in permitting full model calculations to enable assessment of our approximations. DTIC

SIMULATION APPROACHES FOR CALCULATIONS IN DIRECTED GRAPHICAL MODELS
Constantin T. Yiannoutsos and Alan E. Gelfand 12 Oct. 1993 35 p
(Contract N00014-92-J-1264)
(AD-A274825; TR-475) Avail: CASI HC A03/MF A01

In formulating models for a complex system, graphical representation is an effective tool. When the components of the system are viewed as random variables, directed graphical models detail the nature of the dependence among them. Moreover, if for each variable the conditional distribution is provided according to the graph, the joint distribution is uniquely determined. Natural questions arise about the static behavior of the system under such specification as well as its response to information (observed levels of some of the variables). Answers to these questions require the ability to calculate arbitrary marginal and conditional distributions. In complex cases (high dimensional structures) such calculations require high dimensional integrations and/or summations. Most of the work to date has taken advantage of properties of directed graphs to facilitate exact calculations but is limited with regard to distributional assumptions and feasible system size. Monte Carlo methods for such calculations can accommodate much larger system size with arbitrary dependence structure and distributional forms yielding approximations which can be as accurate as desired. It is the objective of this paper to detail such methodology. An illustration is provided using a diagnostic system for congenital heart disease in neonates. DTIC

Estimation techniques are given for the three-parameter Weibull distribution, with the location (or origin) parameter unknown, and possibly also the shape and/or scale parameters unknown. Tests of fit are described, and tables are given for the EDF statistics A(2), W(2) and U(2), to make the tests. Several examples are discussed. DTIC

Performance and reliability analysis of distributed systems based on formal specifications is an important and widely recognized issue. This paper treats a probabilistic version of the process algebra LOTOS. It incorporates a probabilistic choice assigning a probability of occurrence to each of its alternatives. Opposed to the traditional interleaving semantics used for existing probabilistic process algebras the presented language is based on a true concurrency semantics. This enables us to distinguish between non-determinism and parallelism, to reduce the state explosion problem and, moreover, to analyze part of the system without considering other (irrelevant) parts. In this paper the language is presented and the formal semantics is defined by using an extension of bundle event structures. A short example illustrates the novelties of the language and links the language to stochastic analysis based on semi-Markov chains. NTIS

In this paper we propose a model, recursive bundle event structures (recBES), of finite, graph-based representations for a class of (possibly) infinite bundle event structures. The model must be at least as powerful as Finite State Automata (FSA). This is because we want to use it as a basis for a probabilistic model which can fully and effectively exploit Markov Theory. This is a minimal requirement in the sense that recBES are indeed more powerful than FSA and can give rise to probabilistic models which can represent stochastic processes which are not Markovian, but the stochastic behavior of which can still be effectively studied. SOME CONTRIBUTIONS TO THE THEORY OF MONOTONE DEPENDENCE
D. M. Cifarelli and E. Regazzini 1994 33 p
(PB94-124922) Avail: CASI HC A03/MF A01

During the 1914-1916 three-year period, the Italian statistician Corrado Gini published a certain number of papers concerning the measure of the concordance (positive dependence) and discordance (monotone dependence) between two ordered characters. The present paper aims at providing an accurate, analytical representation of Gini's original idea of index of homophily. In the Ginian statistical framework, the concept of cograduation is strictly connected with that of homophily. In fact, the first is the counter-part of the second when ranks are considered in the place of true values. We will deal with cograduation in Section 3. There it will be shown, for example, that the well-known Gini's cograduation index and Spearman's rank correlation coefficient are the expression of the general index of Section 2 in very specific cases. Furthermore, we will use the index of Section 2 to define a general class of cograduation indices which work when ties are present. Section 4 deals with some miscellaneous results relating to the analytical expression of the index of homophily under specific conditions. NTIS

LIMIT THEOREMS FOR FUNCTIONALS OF MARKOV PROCESSES AND RENORMALIZABLE STABLE FIELDS
Raisa E. Feldman and Nagamani Krishnakumar 1993 18 p
(Contract N00014-89-J-1870)
(AD-A274645) Avail: CASI HC A03/MF A01

We study the limiting distribution of the amount of charge left in some set by an infinite system of charged Markovian particles, when the charge distribution belongs to the domain of attraction of a symmetric alpha-stable law. The limits are symmetric alpha-stable generalized random fields. Their multiple integrals are built in a similar manner. We also study the renormalizability of these families of random fields and use the construction to simulate stable fields on R1 and R2. DTIC

WHITE NOISE THEORY OF ROBUST NONLINEAR FILTERING WITH CORRELATED STATE AND OBSERVATION NOISES
A. Bagchi and R. Karandikar Jun. 1993 19 p
(PB94-126661; MEMO-1138) Avail: Issuing Activity (National Technical Information (NTIS)

One purpose of the paper is to remove the asymmetry in the existing 'direct' white noise theory by modeling the state process as the solution of a stochastic differential equation with a 'directly modelled' white noise as the input. It is shown that the solution of such a stochastic differential equation is, indeed, a Markov process. With this formulation, it is straightforward to introduce correlation between the state and observation noises. The other purpose of the paper is to obtain robust nonlinear filtering equation for stochastic dynamical systems with correlated state and observation noises. NTIS

Modern methods of statistical data analysis, such as empirical and hierarchical Bayesian methods, should find increasing use in future Probabilistic Risk Assessment (PRA) applications. In addition, there will be a more formalized use of expert judgment in future PRA's. These methods require an extension of the probabilistic framework of PRA, in particular, the popular notion of probability of frequency, to consideration of frequency of frequency, frequency of probability, and probability of probability. The genesis, interpretation, and examples of these three extended notions are discussed. DOE

ESTIMATORS FOR THE CAUCHY DISTRIBUTION
K. M. Hanson and D. R. Wolf 1993 9 p Presented at the 13th MAXENT Workshop, Santa Barbara, CA, 1-3 Aug. 1993
(Contract W-7405-eng-36)
(DE94-004990; LA-UR-93-4251; CONF-9308205-1) Avail: CASI HC A02/MF A01

The properties of various estimators of the central position of the Cauchy distribution are discussed. The performance of these estimators is evaluated for a set of simulated experiments. Estimators based on the maximum and mean of the posterior probability density function are empirically found to be well behaved when more than two measurements are available. On the contrary, because of the infinite variance of the Cauchy distribution, the average of the measured positions is an extremely poor estimator of the location of the source. However, the median of the measured positions is well behaved. The rms errors for the various estimators are compared to the Fisher-Cramer-Rao lower bound. It was found that the square root of the variance of the posterior density function is predictive of the rms error in the mean posterior estimator. DOE

In December 1991, the Strategic Defense Initiative Organization (SDIO) proposed investigating whether launching a Russian Topaz-II space nuclear power system could be done safely and within budget constraints. Functional safety requirements developed for the U.S. Topaz mission mandated that the reactor remain subcritical when immersed in water. Topaz-II is an epithermal, enriched-uranium-fueled, NaK- (liquid metal alloy with 22% sodium and 78% potassium) cooled, and zirconium hydride-moderated reactor. A radial beryllium reflector containing 12 rotatable control drums surrounds the core. The authors prepared a computer model of the Topaz reactor that explicitly represented all major reactor components. Initial analyses indicated that in several water-immersion scenarios, the reactor would not remain subcritical. After additional calculations, modifications were proposed that would assure subcriticality under such conditions. This paper describes the analyses and the proposed modifications. DOE

ARBITRARY-ORDER NUMERICAL SCHEMES FOR MODEL PARABOLIC EQUATIONS
Jian Shi Sep. 1992 27 p
(Cranfield-Aero-9210; ISBN-1-871564-493; ETN-94-95217) Avail: CASI HC A03/MF A01

The general theory and methodology of high order numerical schemes for one dimensional model parabolic equations are investigated. The universal formula from which a two level explicit arbitrary order numerical methods for diffusion equation can be derived is developed. Using the universal formula some high order numerical methods are constructed. Important features of numerical methods are revealed through the construction of high order numerical methods and stability analysis. Subject to the limitation of diffusion number, d, being positive, only the method that satisfies positive stable region is relevant. Because of the limitation of the diffusion number, some numerical schemes are physically violating. In order to obtain a physically correct and numerically stable method, a numerical method which possesses a positive stable region in terms of diffusion number d was selected. The results indicate that the ideal numerical schemes for the model parabolic equation are central point schemes which have the largest stable region. ESA

ARBITRARY-ORDER HIGH RESOLUTION SCHEMES FOR MODEL HYPERBOLIC CONSERVATION LAWS
Jian Shi Jul. 1992 94 p
(Cranfield-Aero-9209; ISBN-1-871564-514; ETN-94-95216) Avail: CASI HC A05/MF A01

The general theory and methodology of high resolution numerical schemes for one dimensional hyperbolic conservation laws are investigated. The universal formula from which two level explicit conservative arbitrary order numerical methods can be derived is developed. The issue of linear stability is considered. A new approach to linear stability analysis is presented. The generalized formulation for total variation diminishing methods with stable region of c between -1 and 1 is proposed. To demonstrate the theories, third order and fourth order total variation diminishing methods are generated. Computational results of these schemes show features of high resolution methods. ESA

THE DIRAC EQUATION IN KERR SPACETIME, SPHEROIDAL COORDINATES AND THE M.I.T. BAG MODEL OF HADRONS
Bruce H. J. McKellar, Mark J. Thomson, and G. J. Stephenson, Jr. (Los Alamos National Lab., NM.) Mar. 1993 13 p
(DE94-601566; UM-P-93/22; OZ-93/08) Avail: CASI HC A03/MF A01 (US Sales Only)

The Dirac equation in Kerr spacetime is separated using the rotating tetrad formalism. This allows solutions of the Dirac equation, in flat spacetime, written in oblate and prolate spheroidal coordinates to be extracted. The usual M.I.T. bag boundary condition is then found to be incompatible with a nonvanishing separated wave function except in the spherical limit. However, it is shown that an alternative boundary condition can arise naturally in scalar-pseudoscalar potential models, that is physically motivated and allows for a non-trivial solution. DOE

DIMENSIONAL CROSSOVER FROM NON-RENORMALIZABILITY TO RENORMALIZABILITY
Yu. A. Kubyshin, D. OConnor, and C. R. Stephens 1991 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-613052; JINR-E-2-91-497) Avail: CASI HC A03 (US Sales Only)

It is shown for one loop that a (lambda)(Phi)(exp 4) theory contracts from being a non-renormalizable theory above four dimensions to a renormalizable theory in the limit of zero size of the additional dimensions above four dimensions. This provides an example of the decoupling of an infinite number of modes in the infrared domain of the theory. The results have applications to statistical mechanical systems above the critical point in the context of finite size effects and Kaluza-Klein theories in high energy physics. DOE

ANALYTICAL SOLUTION OF MORI'S EQUATION WITH SECANT HYPERBOLIC MEMORY
K. Tankeshwar and K. N. Pathak (Panjab Univ., Chandigarh, India.) Jul. 1993 20 p
(DE94-601541; IC-93/206) Avail: CASI HC A03/MF A01 (US Sales Only)

The equation of motion of the auto-correlation function has been solved analytically using a secant-hyperbolic form of the memory function. The analytical results obtained for the long time expansion together with the short time expansion provide a good description over the whole time domain as judged by their comparison with the numerical solution of Mori's equation of motion. We also find that the time evolution of the auto-correlation function is determined by a single parameter (tau) which is related to the frequency sum rules up to the fourth order. The auto-correlation function has been found to show simple decaying or oscillatory behavior depending on whether the parameter (tau) is greater than or less than some critical values. Similarities as well as differences in time evolution of the auto-correlation have been discussed for exponential, secant-hyperbolic, and Gaussian approaches of the memory function. DOE

OPERATOR REGULARIZATION AND RENORMALIZATION THEORY
Ph.D. Thesis
Louis B. Culumovic Feb. 1989 140 p
(ISBN-0-315-49334-8; CTN-94-60976) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The operator regularization (o.r.) technique is extended beyond one-loop order in perturbation theory, and some two-loop calculations in o.r. are performed. First, the Schwinger expansion is used to calculate the general coefficients of the DeWitt expansion, which enables using this expansion beyond one-loop order. An approach to calculating renormalization group functions based on examining finite Green functions is then presented. Explicit calculations of the renormalization group functions to develop two-loop order are performed in scalar models using the new DeWitt expansion coefficients. Two other applications are included, one being the computation of the divergence of the U(1) axial current in the presence of constant U(1) and SO(3) gauge fields to two-loop order. This combines o.r. with a functional technique, and a result compatible with the Adler-Bardeen result is obtained. The other application is to massive Yang-Mills theory. Introducing a mass breaks gauge invariance and makes the theory non-renormalizable. Since o.r. always gives finite results, it presents the opportunity to examine a non-renormalizable theory without the usual difficulties. It turns out that the arbitrary mass scale parameter loses its arbitrariness and becomes fixed by the strength of a radiatively induced four-point interaction. Author (CISTI)

A SURVEY OF OPEN PROBLEMS IN SYMPLECTIC INTEGRATION
Robert I. McLachlan (Colorado Univ., Boulder.) and Clint Scovel 15 Oct. 1993 27 p Presented at the Integration Algorithms for Classical Mechanics, Ontario, 14-27 Oct. 1993
(Contract W-7405-eng-36)
(DE94-003966; LA-UR-93-3914; CONF-9310235-1) Avail: CASI HC A03/MF A01

In the past few years there has been a substantial amount of research on symplectic integration. The subject is only part of a program concerned with numerically preserving a system's inherent geometrical structures. Volume preservation, reversibility, local conservation laws for elliptic equations, and systems with integral invariants are but a few examples of such invariant structures. In many cases one requires a numerical method to stay in the smallest possible appropriate group of phase space maps. It is not the authors' opinion that symplecticity, for example, automatically makes a numerical method superior to all others, but it is their opinion that it should be taken seriously and that a conscious, informed decision be made in that regard. A survey of open problems in symplectic integration, including other problems from the larger program are presented. This is not intended as a review of symplectic integration and is naturally derived from the authors' own research interests. At present, this survey is incomplete, but the authors hope the help of the colleagues to be able to include in the proceedings of this conference a more comprehensive survey. Many of the problems mentioned call for numerical experimentation, some for application of suggested but untested methods, some for new methods, and some for theorems. Some envisage large research programs. DOE

STOCHASTIC RESONANCE IN A PERIODIC POTENTIAL SYSTEM UNDER A CONSTANT FORCE
Hu Gang Oct. 1992 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616817; IC-92/339) Avail: CASI HC A02 (US Sales Only)

An overdamped particle moving in a periodic potential, and subject to a constant force and a stochastic force (i.e., x = -sin(2(pi)(chi)) + B + (Gamma)(t), (Gamma)(t) is a white noise) is considered. The mobility of the particle, d(x(t))/dt, is investigated. The stochastic resonance type of behaviour is revealed. The study of the SR problem can thus be extended to systems with periodic force. THEORETICAL AND EXPERIMENTAL STUDIES OF ELEMENTARY PHYSICS
A. Bodek, T. Ferbel, A. C. Melissinos, P. Slattery, P. Tipton, A. Das, C. R. Hagen, S. G. Rajeev, S. Okubo, and L. Orr 1 May 1993 166 p
(Contract DE-FG02-91ER-40685)
(DE94-002310; DOE/ER-40685/759) Avail: CASI HC A08/MF A02

The various components of the high-energy physics research program at the University of Rochester are presented. Fixed-target experimentation at FNAL includes studies of direct photon production by p and (pi) on H, Be, and Cu, and hybrid mesons and other physics issues in Coulomb excitation at high energies. The status of the GEM (Gammas, Electrons, and Muons) Experiment at the SSC is given. The D-Zero experiment at FNAL is reviewed. Deep inelastic lepton--nucleon scattering experiments are summarized: electron scattering experiments at SLAC, FNAL neutrino quad triplet runs, FNAL neutrino sign selected experiments, and SDC cosmic ray test and test beam calibration. Studies of nonlinear QED at SLAC concentrated on a study of QED at critical field strength in intense laser--high-energy electron collisions. Development work on the Collider Detector at Fermilab (CDF) emphasized the CDF silicon vertex detector, the end plug calorimeter, and the SDC tile/fiber calorimetry. The theoretical physics effort is sketched. DOE

A TRANSIENT SYMMETRICAL METHOD FOR THE MEASUREMENT OF TEMPERATURE DEPENDENT THERMAL DIFFUSIVITY
Matti Kokkala and Djebar Baroudi Apr. 1993 27 p Sponsored by Finnish Fire Research Board, Finland
(ISSN 1235-0605)
(VTT-TIED-1452; ISBN-951-38-4345-9; ETN-94-95267) Copyright Avail: CASI HC A03/MF A01

Measurement of temperature dependent thermal diffusivities using a transient symmetrical method is studied. The thermal diffusivity is determined from the temperature profile in a specimen constructed of thin slabs and heated symmetrically from both sides. The thermal diffusivity is determined as the ratio of the time derivative and the second spatial derivative at the position of the extremum of temperature. A numerical method was developed to calculate the thermal diffusivity as a function of time. The confidence interval of the diffusivity is determined. The numerical methods were validated by using numerically calculated temperature profiles for a material with known thermal diffusivity. The practical applicability of the method was investigated. The method proved to work for an inert material when no changes of geometry of the sample occurred. If reactions, convection, or substantial thermal expansions causing gaps inside the specimen occur, the assumptions of the method do not hold, and the results will not be well defined. ESA

BISEXUAL BRANCHING DIFFUSIONS
Leonid Mytnik and Robert J. Adler 30 Dec. 1993 38 p
(Contract N00014-89-J-1870)
(AD-A274698) Avail: CASI HC A03/MF A01

The limiting behavior of large systems of two types of Brownian particles undergoing bisexual branching is studied. Particles of each type generate individuals of both types, and the respective branching law is asymptotically critical for the two dimensional system, while being subcritical for each individual population. The main result of the paper is that the limiting behavior of suitably scaled sums and differences of the two populations is given by a pair of measure and distribution valued processes which, together, determine the limit behaviors of the individual populations. Proofs are based on the martingale problem approach to general state space processes. The fact that the limit involves both measure and distribution valued processes requires the development of some new methodologies of independent interest. DTIC

POWER LAWS, FLICKER NOISE, AND THE BARKHAUSEN EFFECT Final Report
L. V. Meisel and P. J. Cote Oct. 1993 25 p
(AD-A274702; ARCCB-TR-93038) Avail: CASI HC A03/MF A01

The Barkhausen effect was studied in three ferromagnetic metals: an amorphous alloy, iron, and alumel. The data exhibit all the characteristics of self-organized critical behavior enumerated by Bak, Tang, and Weisenfeld: The distributions of pulse durations, areas, and energies have the form of power laws, which have been modified to account for finite-size effects, and the power spectral densities have the form of flicker noise. Furthermore, the parameters describing the Barkhausen noise pulse distributions are consistent with those characterizing the power spectral density in the light of the results of Jensen, Christensen, and Fogedby. The data are also consistent with a model based on an inherent static fractal structure, independent of a self-organizing principle. DTIC

(Contract F04701-88-C-0089)
(AD-A274812; TR-92(2925)-3; SMC-TR-93-58) Avail: CASI HC A02/MF A01

Recent theoretical calculations suggest that the short-term stability of rubidium, atomic, gas-cell frequency standards could be improved by several orders of magnitude if diode lasers were used for optical pumping. Moreover, the theoretical results predict that rubidium, as opposed to cesium, is the best alkali atom to choose for gas cell atomic clock operation. This report describes strategies for developing such clocks for space applications and as local oscillators for other high-accuracy atomic clocks. DTIC

NORMAL FORMS FOR PERTURBATIONS OF THE EULER TOP
Heinz Hanssmann 28 Mar. 1993 34 p
(PB94-125390; W-9309) Avail: CASI HC A03/MF A01

A method for studying the behavior of a rigid body in a general force field is proposed. The study is restricted to the case of a perturbation of the Euler top by a small external force. A normal form approach yields a formal 2-torus symmetry, which in turn leads to the reduction to a one-degree-of-freedom system. The behavior of this system is used to identify quasi-periodic motions of the rigid body with two or three independent frequencies. The method is tested in the integrable cases of Lagrange and Kirchhoff. Furthermore, it is applied to some nonintegrable cases in which two of the principle moments of inertia of the rigid body are equal. NTIS

A SUPERPROCESS WITH A DISAPPEARING SELF-INTERACTION
Robert J. Adler and Lidia Ivanitskaya 1993 15 p
(Contract N00014-89-J-1870)
(AD-A274647) Avail: CASI HC A03/MF A01

We start with a system of independent branching Brownian motions which, properly organized and normalized, generate a super Brownian motion in the high density limit. We introduce a weak interaction between the particles, that affects the diffusion but not the branching. The interaction is chosen in such a way that the infinite density limit is absolutely continuous with respect to the non-interacting system. We find that, despite the fact that the interaction mechanism never completely disappears, the limiting superprocesses are identical. We study what actually happens to the interaction mechanism, or ghost-process. DTIC

In previous work we have proved existence and obtained estimates for the (finite) Huasdorff and fractal dimensions of global (maximal compact) attractors for the Landau-Lifschitz equations. These are the fundamental equations of the classical theory ferromagnetism. In order to obtain more detailed information about these attractors, we are currently developing approximation methods based on the theory of inertial manifolds. Inertial manifolds are finite dimensional manifolds which attract all solutions at an exponential rate. They contain the global attractor and have the advantage that they are manifolds whereas the attractors generally are not(they can be complicated fractal sets). The equations reduce to a finite-dimensional system of O.D.E.'s on the inertial manifolds. DTIC

Hardware designers often use digital waveforms to specify critical device timing. Several problems related to the use of such specifications are analyzed. These include the verification of the coherence of specifications; the determination of whether each device's timing requirements are satisfied by the timing of other devices in the system, given the timing specifications of devices in a system; and derivation of the conditions that must be met for the timing of a system to be considered reliable, when specifications are incomplete. Timing specifications are formulated as sets of linear constraints, and it is shown that the problems can be solved with optimization techniques. Several algorithms are presented along with open problems concerning efficient solutions. In addition, a model is proposed for the propagation of events in a digital circuit that can serve as a basis for the timing bounds found in specifications. This model is used to show that the method used to test the satisfiability of specifications is safe in the sense that affirmative answers are trustworthy while negative answers may be conservative. The work reported can serve as a basis for the design of computer aided design tools for validating timing specifications, analyzing the timing of device connections, and synthesizing the conditions that ensure reliability. The John A. Volpe National Transportation Systems Center (Volpe Center), in support of the Federal Aviation administration, Office of Environment and Energy, has developed Version 4.11 of the Integrated Noise Model (INM). The User's Guide for the Version 4.11 computer software is a supplement to INM, Version 3, User's Guide - Revision 1 for the Version 3.10 computer software released in June, 1992. The Version 4.11 supplement, prepared by the Volpe Center's Acoustics Facility, presents computer system requirements as well as installation procedures and enhancements. Specific enhancements discussed include: (1) the introduction of a takeoff profile generator; (2) the ability to account for terrain elevation around a specified airport; (3) the ability to compute the CNEL, WECPNL, LEQDAY, and LEQNIGHT noise metrics; (4) the ability to account for airplane runup operations; (5) the ability to account for displaced runway thresholds during approach operations; (6) an enhancement to the noise contour computations: (7) an increase in the number of takeoff profile segments; and (8) enhancements to the echo file. BINAURAL ROOM SIMULATION M.S. Thesis
Brian A. Smith Dec. 1993 127 p
(AD-A273823; AFIT/GAM/ENC/93D-1) Avail: CASI HC A07/MF A02

Research in binaural and spatial hearing is of particular interest to the Air Force. Applications in cockpit communication, target recognition, and aircraft navigation are being explored. Human auditory localization cues are examined and a mathematical model for the transfer function of a sound signal traveling from an isotropic point source through a rectangular room to both ears of a listener is developed. Using this model as a guide, non-head coupled binaural sound signals are generated in a binaural room simulation. Reflection and attenuation cues included in the computer generated signals are varied in order to determine which cues enhance the listener's degree of extracranialization. Results of this research indicate that the addition of three or more attenuated reflections into a non-head coupled binaural signal provide the listener with a binaural sound that is localized extracranially. NEW VARIATIONAL TECHNIQUES FOR ACOUSTIC RADIATION AND SCATTERING FROM ELASTIC SHELL STRUCTURES Final Report
Jerry H. Ginsberg 20 Dec. 1993 24 p
(Contract N00014-91-J-1187)
(AD-A274599) Avail: CASI HC A03/MF A01

The interaction between a vibrating submerged structure and the surrounding fluid, which features coupling between the surface pressure distribution and the structural displacement, is an inherent feature for sound radiation and target strength analyses. A variety of approaches have been implemented in the past, but each suffers from serious limitations. Formal mathematical analysis using separation of variables or integral transform techniques is suitable only for the simplest structural models, while full finite element descriptions of realistic structures and the surrounding medium lead to excessively large computer simulations. One approach uses approximate impedance-type boundary condition of uncertain accuracy to model the fluid response. Boundary element formulations rationally represent the interaction phenomena without explicitly solving field equations for the fluid, at the expense of an enormous increase in computational effort due to the need to cover the surface with a reasonably fine mesh. PREWHITENING OF COLORED NOISE FIELDS FOR DETECTION OF THRESHOLD SOURCES Final Report
Alain C. Barthelemy 7 Nov. 1993 54 p
(AD-A274346; NUWC-NPT-TR-10495) Avail: CASI HC A04/MF A01

This report presents an algorithm for the estimation of noise correlations for an array of sensors. The algorithm assumes a mixed spectra model composed of discrete sinusoidal sources and continuous noise components. A spatial autoregressive (AR) process models the continuous component. Previous methods use spatial AR models with real coefficients, restricting the utility of the model to noise sources that impinge on an array at broadside. The complex formulation presented here solves the general problem of arbitrarily oriented noise sources. The technique uses a gradient algorithm for maximization of a likelihood functional to solve for the complex AR coefficients. Once the algorithm determines the noise covariance matrix, prewhitening techniques allow detection of threshold sources. The multiple signal classification (MUSIC) direction finder when applied to the prewhitened observed correlation matrix illustrates the usefulness in detecting low signal-to-noise ratio (SNR) sources. Computational examples use the standardized test case (STC), a realistic model with a challenging range of SNR and difficult source locations. DTIC

HYDROACOUSTIC WAVE-FIELDS GENERATED BY DIFFERENT SOURCE TYPES, A COMPUTATIONAL STUDY
Joacim Tegnesjoe Jun. 1993 59 p
(ISSN 0347-3694)
(PB94-123536; FOA-C-20929-2.2) Avail: CASI HC A04/MF A01

This report treats hydroacoustic wave field computations from different source types. The numerical method used to solve the hydroacoustic wave equations is the propagator matrix method. Three different kinds of point sources are considered. Simulations are carried out for each one of them. In addition, an array of symmetric point sources is considered. The basic theory of the propagator matrix method is explained and the source conditions for all source types are given. Low frequency wave fields have a rapid attenuation in the liquid. At higher frequencies, the simulations show a more complex pattern. The wave fields from the vertical point force give zero pressure along a horizontal line out from the source. The dipole gives a wave field that has zero pressure along a vertical line through the source. The array of symmetric point sources is used to excite modes and to compute reflections of a Gaussian plane wave at the sea bed. Mode excitation was carried out with different numbers of sources. Modes are excited with as few sources as six. Especially in cases with a rigid bottom excitation of modes, it is possible even with few sources. A beam incident to the sea bed excites a lateral wave field in the sediment. This wave field causes a horizontal displacement and a splitting of the reflected beam. NTIS

During the past year of the granting period, we have continued to make substantial progress consistent with the objectives outlined in our latest proposal. (1) We have completed an extensive analysis of and succeeded in publishing a very comprehensive set of data concerning the amount of 'comodulation masking release' (CMR) that can be obtained when the coherent envelope information is presented successively rather than simultaneously. It was determined that 'off-frequency' information, such as that which usually produces a CMR, can provide only a very small release from masking when it is presented prior and subsequent to the temporal interval containing the signal. The most striking finding was that the threshold for detecting a 1-kHz tone masked by an 50-Hz-wide band of noise centered on 1 kHz, was reduced by 7 dB when an identical, 'on frequency', masking noise was presented in all four intervals of our two-cue, two-interval, forced-choice procedure. (2) We finished three other papers, one of which was published and two of which have been revised and resubmitted. (3) We are currently collecting data concerning how varying the forward fringe of a masker affects the magnitude of the binaural masking-level difference. The experiments are being conducted with low-frequency signals where the interaural cues are conveyed by the fine-structure of the waveform and with high-frequency signals where the interaural cues are conveyed via the envelope of the waveform. A method is developed for predicting the radiant heat flux distribution produced by tungsten filament, tubular fused-quartz envelope heating systems with reflectors. The method is an application of Monte Carlo simulation, which takes the form of a random walk or ray tracing scheme. The method is applied to four systems of increasing complexity, including a single lamp without a reflector, a single lamp with a Hat reflector, a single lamp with a parabolic reflector, and up to six lamps in a six-lamp contoured-reflector heating unit. The application of the Monte Carlo method to the simulation of the thermal radiation generated by these systems is discussed. The procedures for numerical implementation are also presented. Experiments were conducted to study these quartz heating systems and to acquire measurements of the corresponding empirical heat flux distributions for correlation with analysis. The experiments were conducted such that several complicating factors could be isolated and studied sequentially. Comparisons of the experimental results with analysis are presented and discussed. Good agreement between the experimental and simulated results was obtained in all cases. This study shows that this method can be used to analyze very complicated quartz heating systems and can account for factors such as spectral properties, specular reflection from curved surfaces, source enhancement due to reflectors and/or adjacent sources, and interaction with a participating medium in a straightforward manner.

METHODS OF TESTING FOR ENDURANCE OF STRUCTURAL ELEMENTS USING SIMULATED ACOUSTIC LOADING
Oct. 1993 27 p
(ISSN 0141-3961)
(ESDU-93027; ISBN-0-85679-880-0) Avail: ESDU

ESDU 93027 discusses methods of testing structural elements, designed to represent features of the full-size structure, using random-amplitude narrowband loading to simulate response to acoustic loading. A wide range of element geometries is included with information on probable failure locations, typical sizes, and any inherent limitations. Mounting methods are considered with examples of multiple specimen tests to allow the scatter in fatigue life to be determined in minimum elapsed time. Guidance is provided on excitation requirements, the measurement and monitoring instrumentation, specimen tuning, and the assessment of structural damping and response linearity. The means of defining a failure are considered, with particular reference to composite structures, and the use of residual strength assessment is discussed. The application of the techniques to obtain endurance data at elevated temperature is addressed. Finally, guidance is included on the interpretation of the results. ESDU

VIBRATIONAL ENERGY TRANSFER WITHIN THE B 3PI (O(+) SUB u) STATE OF 79BR2 UPON COLLISION WITH N2, O2, NO, AND SF6 M.S. Thesis
Gregory S. Williams Dec. 1993 75 p
(AD-A273905; AFIT/GAP/ENP/93D-10) Avail: CASI HC A04/MF A01

Vibrational transfer and electronic quenching in the lower vibrational levels of the (79)Br2(B; v' less than or equal to three) were investigated using spectrally resolved, temporally resolved pulsed laser induced fluorescence techniques. Spectrally resolved emissions from collisionally populated Br2(B) vibrational levels were observed for N2, O2, NO, and SF6 collision partners. The vibrational transfer was efficient in the non-predissociative vibrational levels and is adequately described by the Montroll-Shuler model. DTIC

SECONDARY PARTICLE IN BACKGROUND LEVELS AND EFFECTS ON DETECTORS AT FUTURE HADRON COLLIDERS
T. Pal Jun. 1993 23 p Presented at the Workshop on B Physics at Hadron Colliders, Snowmass, CO, 21 Jun. - 2 Jul. 1993 Submitted for publication
(Contract DE-AC35-89ER-40486)
(DE94-003378; SSCL-520; CONF-9306258-8) Avail: CASI HC A03/MF A01

The next generation of hadron colliders, the Superconducting Super Collider (SSC) and the Large Hadron Collider (LHC), will operate at high center-of-mass energies and luminosities. Namely, for the SSC (LHC) the square root of s = 40 TeV (the square root of s = 16 TeV) and L = 10(exp 33) cm(exp -2)s(exp -1) (L = 3 x 10(exp 34) cm(exp -2)s(exp -1)). These conditions will result in the production of large backgrounds as well as radiation environments. Ascertaining the backgrounds, in terms of the production of secondary charged and neutral particles, and the radiation environments are important considerations for the detectors proposed for these colliders. An initial investigation of the radiation levels in the SSC detectors was undertaken by D. Groom and colleagues, in the context of the 'task force on radiation levels in the SSC interaction regions.' The method consisted essentially of an analytic approach, using standard descriptions of average events in conjunction with simulations of secondary processes. Following Groom's work, extensive Monte Carlo simulations were performed to address the issues of backgrounds and radiation environments for the GEM and SD C3 experiments proposed at the SSC and for the ATLAS and CMS experiments planned for the LHC. The purpose of the present article is to give a brief summary of some aspects of the methods, assumptions, and calculations performed to date (principally for the SSC detectors) and to stress the relevance of such calculations to the detectors proposed for the study of B-physics in particular. BACK-REACTION BEYOND THE MEAN FIELD APPROXIMATION

Y. Kluger 1993 14 p Presented at the NATO Advanced Study Institute on Hot and Dense Nuclear Matter, Bodrum, Turkey, 26 Sep. - 9 Oct. 1993
(Contract W-7405-eng-36)
(DE94-003936; LA-UR-93-4147; CONF-930999-2) Avail: CASI HC A03/MF A01

A method for solving an initial value problem of a closed system consisting of an electromagnetic mean field and its quantum fluctuations coupled to fermions is presented. By tailoring the large N(sub f) expansion method to the Schwinger-Keldysh closed time path (CTP) formulation of the quantum effective action, the causality of the resulting equations of motion is ensured, and a systematic energy conserving and gauge invariant expansion about the electromagnetic mean field in powers of 1/N(sub f) is developed. The resulting equations may be used to study the quantum nonequilibrium effects of pair creation in strong electric fields and the scattering and transport processes of a relativistic e(+)e(-) plasma. Using the Bjorken ansatz of boost invariance initial conditions in which the initial electric mean field depends on the proper time only, we show numerical results for the case in which the N(sub f) expansion is truncated in the lowest order and compare them with those of a phenomenological transport equation. ATOMIC-SCALE CHEMISTRY OF METAL SURFACES

Kenichi Tanaka Feb. 1993 24 p Sponsored by Asahi Glass Foundation, Tokyo, Japan
(ISSN 0082-4798)
(Rept-A-2657; JTN-94-80528) Avail: CASI HC A03/MF A01

The concept of pseudo-molecules is derived from reviewing the results of Scanning Tunneling Microscopy (STM) of metal surfaces. Ni(110), Cu(110), and Ag(110) surfaces exposed to H2 or O2 at room temperature reveal the formation of one-dimensional pseudo-molecules. This is essentially different from the phenomenon of adsorption. The pseudo-molecules produced on the surface are in an ordered arrangement on these metal surfaces. The ordering style is influenced by their lateral interaction. The -Cu-O- chains oriented along the group of zone (001) zone axes direction coalesce to form a p(2 x 1) arrangement on the Cu(110), but the added -Ag-O- rows on the Ag(110) surface may not prefer the p(2 x 1) structure, because the p (2 x 1) -Ag-O- added row induces a large distortion of the substrate Ag atoms. As a result, the added -Ag-O- rows undergo sequential change of the p(n x 1) structures. When the p(2 x 1) -Cu-O- island is annealed at 550 - 640 K, the p(2 x 1) overlayer bunches into regular-sized in-phase p(2 x 1) -Cu-O- islands. In contrast, reordering of the (2 x 1) -Ag-O- overlayer to (4 x 1) at 500 K yields narrow out-of-phase (4 x 1) domains with the wavering domain boundaries. Based on these results, the influence of pseudo-molecules on catalysis is predicted. Author (NASDA)

PREDICTING ANTENNA PARAMETERS FROM ANTENNA PHYSICAL DIMENSIONS Final Report

Steven E. Lundholm, R. C. Robertson, and Randy L. Borchardt Dec. 1993 269 p
(AD-A273893; NPS-EC-93-019) Avail: CASI HC A12/MF A03

This report details the development and provides the documentation for custom computer software applications that evaluate antenna parameters. The applications are written in Mathcad 3.1 for the following antenna types: linear, planar, and circular arrays; folded dipole; caged dipole; parabolic reflectors with helical and spiral feeds. Inputs to the applications are limited to the antenna's physical dimensions. In some cases, ground parameters are required. The chapters are structured to provide the user with the necessary information needed to use and interpret the software for each antenna type. The software applications are proved as appendices and give examples of each antenna type. Outputs of the applications provide various numerical and performance predictions, as well as fax-field radiation patterns. The results computed are consistent with predictions provided in applicable publications, as well as those calculated by numerical antenna analysis programs such as ELNEC. DTIC

CHARACTERIZATION OF THE ENERGY DEPOSITION PRODUCED BY THE PRIMARY ELECTRON BEAM ON THE EXCEDE 3 PROGRAM. APPENDIX B AND C

R. J. Rieder, R. L. McNutt (Johns Hopkins Univ., Laurel, MD.), and S. A. Rappaport May 1993 144 p
(Contract F19628-90-C-0187)
(AD-A273878; VI-2067; PL-TR-93-2132(2); SR-3) Avail: CASI HC A07/MF A02

The primary goal of the EXCEDE III (Excitation by Electron Deposition) atmospheric energy deposition experiment was to monitor the spatial distribution of the energy deposition profile produced by the approx. 18 Ampere approx. 2.5 keV electron beam. During the rocket flight on April 27, 1990, prompt emission at 3914 A from the N2+ (1N) 0-0 transition were measured by a UV scanning photometer. We have inverted the intensity profiles to obtain profiles of energy deposition by the beam. DTIC

A DOUBLE ARM TIME-OF-FLIGHT SPECTROMETER BASED ON POSITION-SENSITIVE PARALLEL-GRID AVALANCHE COUNTERS

G. G. Chubaryan, V. A. Gorshkov, V. E. Zhuchko, S. M. Lukyanov, Kh. G. Ortlepp, V. S. Salamatin, and D. Wohlfarth 1992 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616665; JINR-R-13-92-18) Avail: CASI HC A03 (US Sales Only)

A double arm time-of-flight spectrometer, built-up at the Laboratory of Nuclear Reactions JINR, intended to register and study the characteristics of fission-like products produced in heavy-ion reactions with complex nuclei are presented. The basis part of spectrometer are two identical mobile position-sensitive time-of-flight arms. Each arm consists of a parallel-plate avalanche 'start' counter and of position-sensitive, large area parallel-grid avalanche 'stop' counters. The spectrometer is mounted on a beam-line of the U-400 heavy-ion accelerator. DOE

THEORETICAL AND COMPUTATIONAL STUDIES IN INTERMEDIATE ENERGY NUCLEAR PHYSICS

C. Elster Aug. 1993 9 p
(Contract DE-FG02-93ER-40756)
(DE94-004177; DOE/ER-40756/1) Avail: CASI HC A02/MF A01

The research includes applications of many-body scattering theory to nuclear systems and studies of few-body systems described by effective hadronic field theories. Progress was made in bringing all first-order effects into the nonrelativistic elastic nucleon-nucleus scattering in a consistent fashion. This work is directed towards completely and reliably calculating the first-order term in a Watson expansion including a modification through the nuclear medium. The research effort in few-body physics was concentrated on nucleon-nucleon (NN) scattering below pion production threshold, where recent measurements indicated that the backward-angle neutron-proton (np) differential cross section may show sensitivity to the size of the pion-nucleon coupling constant. THREE METHODS TO MEASURE RH BOND ENERGIES
Joseph Berkowitz, G. Barney Ellison (Colorado Univ., Boulder.), and David Gutman (Catholic Univ. of America, Washington, DC.) 21 Mar. 1993 100 p
(Contract W-31-109-eng-38)
(DE94-003795; ANL/CHM/PP-80545) Avail: CASI HC A05/MF A02

In this paper, the authors compare and contrast three powerful methods for experimentally measuring bond energies in polyatomic molecules. The methods are: radical kinetics; gas phase acidity cycles; and photoionization mass spectroscopy. The knowledge of the values of bond energies are a basic piece of information to a chemist. Chemical reactions involve the making and breaking of chemical bonds. It has been shown that comparable bonds in polyatomic molecules, compared to the same bonds in radicals, can be significantly different. These bond energies can be measured in terms of bond dissociation energies. DOE

QUARK-ANTIQUARK BOUND STATES
W. Lucha and F. Schoeberl 1991 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-613054; JINR-E-4-91-500) Avail: CASI HC A03 (US Sales Only)

This brief review discusses various aspects of the description of hadrons as bound states of quarks at the simpler example of mesons, which are regarded as composite of a constituent quark and antiquark. It is shown how a recently derived relativistic virial theorem may be used in order to cast some light on the interplay between the semi-relativistic and, maybe only effective, nonrelativistic treatment of bound states. Furthermore, a new relativistic approach to fermion-antifermion bound states is briefly sketched and applied in order to predict analytically a few selected general features of the meson spectrum. A STUDY OF VIBRATIONAL RELAXATION OF ELECTRONICALLY-EXCITED MOLECULES
V. V. Datsyuk (Kiev State Univ., USSR.), I. A. Izmailov (Academy of Sciences of the Ukraine, Kiev.), and V. A. Kochelap Sep. 1992 27 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-613553; IC-92/261) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

The time kinetics of the vibrational relaxation of excimers is studied in the diffusional approximation. Simple formulae for functions of nonstationary vibrational distribution are found for the electronically excited molecules. Some spectral-kinetic dependencies of the excimer luminescence are explained in a new way. The possibilities of the determination of excimer parameters are discussed. The dependence of energetical characteristics of excimer lasers on these parameters is particularly emphasized. DOE

COSMOPARTICLE PHYSICS OF FAMILY SYMMETRY BREAKING
Maxim Yu. Khlopov Jul. 1993 12 p
(DE94-601623; IC-93/198) Avail: CASI HC A03/MF A01 (US Sales Only)

The foundations of both particle theory and cosmology are hidden at super energy scale and can not be tested by direct laboratory means. Cosmoparticle physics is developed to probe these foundations by the proper combination of their indirect effects, thus providing definite conclusions on their reliability. Cosmological and astrophysical tests turn to be complementary to laboratory searches of rare processes, induced by new physics, as it can be seen in the case of gauge theory of broken symmetry of quark and lepton families, ascribing to the hierarchy of the horizontal symmetry breaking the observed hierarchy of masses and the mixing between quark and lepton families. DOE

CP VIOLATING FORM FACTORS FOR THREE GAUGE BOSON VERTEX IN THE TWO HIGGS DOUBLET AND LEFT-RIGHT SYMMETRIC MODELS
X. G. He, J. P. Ma, and B. H. J. McKellar 1993 14 p
(DE94-601704; UM-P-92/75; OZ-92/26) Avail: CASI HC A03/MF A01 (US Sales Only)

In this paper we calculate the one loop contributions to the CP violating three gauge boson coupling in two-Higgs doublet and Left-Right symmetric models. In the two-Higgs doublet model only a P conserving and CP violating coupling is generated, and it can be large as 10(sup -3). In the Left-Right symmetric model both P conserving and violating couplings are generated. Due to constraints on the W(sub L)-W(sub R) mixing, these couplings are small. DOE

N94-25842# Flinders Univ., Adelaide (Australia). Electronic Structure of Materials Centre.
CONVERGENT CLOSE-COUPLING CALCULATION OF ELECTRON-SODIUM SCATTERING
Igor Bray Apr. 1993 6 p
(DE94-601815; ESM-54) Avail: CASI HC A02/MF A01 (US Sales Only)

Calculations up to 45 state close-coupling were performed of electrons scattering on atomic sodium, where the target states have been obtained by diagonalizing the target Hamiltonian in a Laguerre basis. Convergence is established by variation of the size of the basis. It is shown that the results are in excellent quantitative agreement at most scattering angles with the measurements of spin asymmetries and L, the angular momentum transferred to the atom perpendicular at the two projectile energies considered of 10 and 20 eV. This demonstrates that the very large effects of the target continuum, in particular on the spin asymmetries, are very accurately represented using square-integrable states. DOE

N94-25853 Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics.
ON THE CLASSIFICATION SCHEME FOR RESONANT STATES OF MUONIC MOLECULES
A. V. Matveenko 1991 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-613645; JINR-E-4-91-370) Avail: CASI HC A03 (US Sales Only)

The hyperradial adiabatic one-state calculation of resonant states of (dd(mu))(sup +) and (dt(mu))(sup +) below the n = 2 level of muonic atoms have been performed. The results are used to produce a new classification scheme for these states. Comparing these calculation with the recent full variational calculation by S.Hara and T.Ishihara it is concluded that the classical Born-Oppenheimer classification scheme can be misleading. DOE

SPECTROSCOPIC AND VIBRATIONAL ENERGY TRANSFER STUDIES IN MOLECULAR BROMINE Ph.D. Thesis
Courtney D. Holmberg Dec. 1993 194 p
(AD-A273795; AFIT/DS/ENP-93-04) Avail: CASI HC A09/MF A03

Vibrational transfer and electronic quenching in the lower vibrational levels (v' less than or equal to 3) of the B(sup 3)pi(O(u)(+)) state of (79)Br2 were investigated using spectrally resolved, temporally resolved laser induced fluorescence techniques. Spectrally resolved emissions from collisionally populated Br2(B) vibrational levels were observed for Br2 and rare gas collision partners. Vibrational transfer was efficient in the non-predissociative vibrational levels and was adequately described by the Montroll-Shuler model for harmonic oscillators. A single fundamental rate coefficient for vibrational transfer from v' = 1 to v'= 0, kv(1,0), characterizes vibrational relaxation. For Br2, the value was kv(1,0) = 3.6 +/- 0.4 x 10(exp -11) cu cm/molec(sec). For rare gas collisions, values ranged from kv(1,0) = 2.5 +/- 0.3 x 10(exp -11) cu cm/molec(sec) for helium to kv(1,0) = 3.1 +/- 0.4 x 10(exp -11) cu cm/molec(sec) for xenon.Electronic quenching rates for the observed vibrational levels were obtained from the same data. For Br2, the quenching rate coefficient was kq = 3.7 +/- 1.2 x 10(exp -11) cu cm/molec(sec). Quenching rate coefficients for the rare gases were smaller, kq = 8.0 +/- 1.2 x 10(exp -12) cu cm/molec(sec). DTIC

N94-25887# International Centre for Theoretical Physics, Trieste (Italy).
VECTOR MESON EXCHANGES AND CP ASYMMETRY IN K(SUP +/-) YIELDS pi(SUP +/-)pi(SUP 0)
Riazuddin, N. Paver (Trieste Univ., Italy.), and F. Simeoni (Trieste Univ., Italy.) Jul. 1993 10 p
(DE94-601605; IC-93/186; UTS-DFT-93-18) Avail: CASI HC A02/MF A01 (US Sales Only)

Using a current algebra framework, the contribution of vector meson exchanges to the CP violating asymmetry in the decay K(sup +/-) yields pi(sup +/-)pi(sup 0), resulting from the interference of the K yields (pi)(pi) amplitude with the radiative correction K yields (pi)(pi)(gamma) is discussed. DOE

N94-25888# Melbourne Univ., Parkville (Australia). School of Physics.
CP VIOLATION IN HIGGS DECAYS
Xiao-Gang He, J. P. Ma, and Bruce McKellar Feb. 1993 9 p
(DE94-601607; UM-P-93/11; OZ-93/5) Avail: CASI HC A02/MF A01 (US Sales Only)

This contribution deals with CP violation in fermion pair decays of Higgs boson. Some CP odd observables related to the tree level decay amplitude are identified. It was found that a few thousand Higgs boson decay events can already provide important information about CP violation. If the Higgs boson is produced, such an analysis could be carried out at the new generation of colliders such as SCC, LHC, and NLC. DOE

N94-25889# Melbourne Univ., Parkville (Australia). School of Physics.
CP TEST IN THE W PAIR PRODUCTION BY WAY OF PHOTON FUSION AT NLC
J. P. Ma and B. H. J. McKellar 1993 12 p
(DE94-601608; UM-P-93/16; OZ-93/06) Avail: CASI HC A03/MF A01 (US Sales Only)

The possibility to test CP invariance in the W(+)W(-) production via photon fusion at NLC was studied. The predictions of the CP violation effects are made within two Higgs doublet extensions of the minimal standard model, where CP violation is introduced by a neutral Higgs exchange in s channel. The width effect in the Higgs propagator on the CP violation effects is discussed in detail. The CP violation effects can be measured in some parameter region of the extensions. DOE

N94-25890# Melbourne Univ., Parkville (Australia). School of Physics.
SEPARABLE EXPANSIONS OF THE NN t-MATRIX BY WAY OF EXACT HALF OFF THE ENERGY SHELL METHODS
G. Pisent, K. Amos, P. J. Dortmans, and L. Canton 1992 44 p
(DE94-601615; UM-P-92/76) Avail: CASI HC A03/MF A01 (US Sales Only)

Recently a method was proposed by which one can obtain rank 1 (for uncoupled channels) and rank 2 (for coupled channels), energy dependent t-matrix representations which are exact on- and half off of the energy shell. Fully off shell, this representation, though accurate at low energies, is flawed. For uncoupled channels, if the phase shift passes through zero, the representation has a pathology. Two methods which overcome this are investigated, one due to Haberzettl which was extended to coupled channels, and the second which is based upon selective combination of the elements of Sturmian expansions. All methods of separation over a range of energies up to 250 MeV for the (sup 1)S(sub 0) and (sup 3)S(sub 1) channels are compared with the Paris interaction. Special attention is paid to the convergence of the higher order Haberzettl expansion and to the comparison of the extended methods for energies around the zero phase shift pathology for the (sup 1)S(sub 0) channel. The method describes well the fully off-shell properties of the t-matrices up to quite high energies, while keeping the rank of the separation as low as possible in order to be used in three or more body calculations. DOE

UNRAVELLING THE STRUCTURE OF MATTER ON HIGH-PERFORMANCE COMPUTERS
T. D. Kieu and B. H. J. McKellar Nov. 1992 10 p
(DE94-601620; UM-P-92/94; OZ-92/34) Avail: CASI HC A02/MF A01 (US Sales Only)

The various phenomena and the different forms of matter in nature are believed to be the manifestation of only a handful set of fundamental building blocks - the elementary particles - which interact through the four fundamental forces. In the study of the structure of matter at this level, one has to consider forces which are not sufficiently weak to be treated as small perturbations to the system, an example of which is the strong force that binds the nucleons together. High-performance computers, both vector and parallel machines, have facilitated the necessary non-perturbative treatments. The principles and the techniques of computer simulations applied to Quantum Chromodynamics are explained, examples include the strong interactions, the calculation of the mass of nucleons and their decay rates. Some commercial and special-purpose high-performance machines for such calculations are also mentioned. DOE

ON RADIATION DEFECTS IN STRIP DETECTORS
V. S. Barashenkov, A. N. Sosnin, and S. Yu. Shmakov 1991 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616646; JINR-R-2-91-505) Avail: CASI HC A02 (US Sales Only)

Radiation defects production in microstrip silicon detector under irradiation by means of protons, alpha-particles and Si-28 ions at energies from dozens of MeV up to several GeVxA and neutron flux at energy 10.5 MeV is calculated by means of the Monte Carlo method. Comparison of these data allows one to derive conclusions on possibility of imitation of the defect production by means of change-over from one beam to the other, more convenient from the point of view of the experimental procedure. NUCLEON-NUCLEON SCATTERING LENGTHS IN QCD SUM RULES
Y. Kondo and O. Morimatsu Feb. 1993 14 p
(DE93-520239; INS-965) Avail: CASI HC A03/MF A01 (US Sales Only)

Nucleon-nucleon scattering lengths are calculated using QCD sum rules. The calculation is based on the observation that the coefficient of the second-order pole term of the nucleon correlation function is proportional to the nucleon-nucleon scattering length at the threshold. By applying the Borel sum rules, we express the scattering length in terms of the expectation values of the quark-gluon field operators with respect to the one-nucleon state. The scattering lengths calculated are in qualitative agreement with the experiment. It is also shown that in the linear density approximation the nucleon mass shift in nuclear matter is related to the nucleon-nucleon scattering length. It is concluded that the recent calculations of the effective nucleon mass in nuclear matter using QCD sum rules with linear density approximation for the condensates should be interpreted in this way. HEAVY QUARK PRODUCTION AND SPECTROSCOPY
J. A. Appel Nov. 1993 22 p Presented at the 16th International Symposium on Lepton and Photon Interactions, Ithaca, NY, 10-15 Aug. 1993
(Contract DE-AC02-76CH-03000)
(DE94-003619; FNAL/C-93/328; CONF-930823-16) Avail: CASI HC A03/MF A01

This review covers many new experimental results on heavy flavor production and spectroscopy. It also shows some of the increasingly improved theoretical understanding of results in light of basic perturbative QCD and heavy quark symmetry. At the same time, there are some remaining discrepancies among experiments as well as significant missing information on some of the anticipated lowest lying heavy quark states. Most interesting, perhaps, are some clearly measured production effects awaiting full explanation. DOE

A DEPENDENCE OF EXCLUSIVE VECTOR MESON PRODUCTION IN MUON-NUCLEUS SCATTERING
Guang Yin Fang (Harvard Univ., Cambridge, MA.) Oct. 1993 5 p
Presented at the 13th International Conference on Particles and Nuclei, Perugia, Italy, 27 Jun. - 3 Jul. 1993
(Contract DE-AC02-76CH-03000)
(DE94-003363; FNAL/C-93/305; CONF-930637-11) Avail: CASI HC A01/MF A01

Preliminary results on the cross section ratios of exclusive rho(sup 0) and phi meson production off carbon, calcium, and lead to that off deuterium in deep-inelastic muon-nucleon scattering are reported. The data were taken with the E665 spectrometer using the Fermilab Tevatron muon beam. The mean beam energy was 470 GeV. Significant increases in the cross section ratios are seen as the four-momentum squared of the virtual photon increases. The results support the idea of color transparency. DOE

SPIN-POLARIZED ATOMIC HYDROGEN: DEVICES AND PHENOMENA Ph.D. Thesis
Anthonius Cornelis Maan 1993 122 p
(ETN-94-95342) Avail: CASI HC A06/MF A02

Several questions in which the spin-polarization of atomic hydrogen is involved are discussed. The effect of a permanent magnetic field on the collisions between two hydrogen atoms and the subsequent influence on the stability of the cryogenic hydrogen maser are treated. It is shown that the introduction of a magnetic field does not produce the hoped for increase in frequency stability. The hydrogen maser is not only used for very precise time keeping, but due to the very narrow linewidth of the maser output it is also suited to obtain information on the hydrogen gas. A variation on the cryogenic hydrogen maser is proposed: the surface cryogenic hydrogen maser. This proposed maser operates at lower temperatures and has an increased area to volume ratio of the storage bulb compared to the cryogenic hydrogen maser. The operating conditions for such a maser are evaluated. It is pointed out that the output characteristics are determined by the two dimensional gas of hydrogen atoms at the surface of the storage bulb. The operation of the cryogenic hydrogen maser is described in a regime of operation which is characterized by a pulsed output power. A method to calculate the recombination rate is proposed. ESA

THE CHERENKOV HADRONIC LIKE-JETS
A. El-Naghy, K. S. Abdel-Khalek, M. Tag El-DinKamal (National Research Centre, Cairo, Egypt.), and M. T. Hussein (Cairo Univ., Egypt.) Jun. 1993 13 p
(DE93-634525; IC-93/148) Avail: CASI HC A03/MF A01 (US Sales Only)

A new mechanism of multiparticle production implying emission of hadronic jets due to Cherenkov gluon radiation was investigated. The present work reports on a systematic study of high multiplicity events in central collisions of Ne-22 + Ag(Br) and Si-28 + Ag(Br) at 4.1 - 4.5A GeV/c. From the analysis, it was shown that 13 events display the characteristic features (ring-like) of Cherenkov or deconfinement hadronic emission. The angles of emission correspond to the formation length of hadrons approximately = 1 fm. The cross section of this phenomena is about 1/100 of total inelastic interaction cross section of Si-28 (Ne-22) with emulsion nuclei at 4.5A GeV/c. DOE

FAST PARALLEL ALGORITHMS FOR SHORT-RANGE MOLECULAR DYNAMICS
S. Plimpton May 1993 40 p
(Contract DE-AC04-76DP-00789)
(DE93-018519; SAND-91-1144) Avail: CASI HC A03/MF A01

Three parallel algorithms for classical molecular dynamics are presented: the first assigns each processor a subset of atoms; the second assigns each a subset of inter-atomic forces to compute; and the third assigns each a fixed spatial region. The algorithms are suitable for molecular dynamics models which can be difficult to parallelize efficiently--those with short-range forces where the neighbors of each atom change rapidly. They can be implemented on any distributed-memory parallel machine which allows for message-passing of data between independently executing processors. The algorithms are tested on a standard Lennard-Jones benchmark problem for system sizes ranging from 500 to 10,000,000 atoms on three parallel supercomputers: the nCUBE 2, the Intel iPSC/860, and the Intel Delta. Comparing the results to the fastest reported vectorized Cray Y-MP and C90 algorithm shows that the current generation of parallel machines is competitive with conventional vector supercomputers even for small problems. For large problems, the spatial algorithm achieves parallel efficiencies of 90%, and the Intel Delta performs about 30 times faster than a single Y-MP processor and 12 times faster than a single C90 processor. Trade-offs between the three algorithms and guidelines for adapting them to more complex molecular dynamics simulations are also discussed. DOE

HEAVY CHARGED LEPTONS IN AN SU(3)(SUB L) X U(1)(SUB N) MODEL
V. Pleitez and M. D. Tonasse Dec. 1992 11 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(DE93-634367; IFT-P-050/92) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

An SU(3)(sub L) x U(1)(sub N) model for the electroweak interactions which includes additional heavy charged leptons is considered. These leptons have not strong constraints on their masses since they do not couple in the same way as the lightest leptons to the neutral-currents and also because new contributions to the muon g-2 factor already suppressed because of the massive new vector boson present in this model. DOE

N94-26042# Gosudarstvennyi Komitet po Ispolzovaniyu Atomnoi Energii, Serpukhov (USSR).
PSEUDOSCALAR GLUEBALL IN THE COMPOSITE INTERPOLATING FIELDS APPROACH
M. L. Nekrasov 1992 26 p
(DE93-634374; IHEP-OTF-92-35) Avail: CASI HC A03/MF A01 (US Sales Only)

The problem of the PS-glueball is revised in the light of the altered experimental situation: instead of one in the i(1440) region there are two or more PS-states. Besides, the production of each of these states in J/(phi) radiative decays is not more effective than that of (eta)'-meson. From the point of view of the conventional understanding, this last property considerably impedes, if not eliminates, the possibility of a glueball interpretation of some of the detected PS-states. The present paper solves this problem within the composite interpolating fields approach using the concept of current quarks and gluons and the N(sub c)(sup -1)-expansion methods. DOE

DECIPHERING THE QUARK-GLUON STRUCTURE OF THE PHOTON IN ELECTRON(GAMMA) COLLISIONS

O. J. P. Eboli, M. C. Gonzalez-Garcia, F. Halzen, and S. F. Novaes Nov. 1992 21 p
(DE93-634386; IFT-P-049/92) Avail: CASI HC A03/MF A01 (US Sales Only)

The capability of an electron(gamma) collider to unravel the hadronic content of the photon is investigated. The experimental problem for probing the gluonic structure of the photon is that small-x triggers overwhelmingly select soft photons rather than soft gluons in hard photons. It is showed that the problem can be finessed in experiments where laser back-scattering is used to prepare a source of very hard photons. It is illustrated their power for studying the parton distribution of the photon and, specifically, for separating the quark and gluon components in events where dijets, jet-(gamma) pairs, and heavy quark pairs are produced. DOE

MODELING DEFECT PRODUCTION IN HIGH ENERGY COLLISION CASCADES

H. L. Heinisch, B. N. Singh (Risoe National Lab., Roskilde, Denmark.), and T. DiazdelaRubia (Lawrence Livermore National Lab., CA.) 1993 16 p Presented at the 6th International Conference on Fusion Reactor Materials, Stresa, Italy, 27 Sep. - 1 Oct. 1993
(Contract DE-AC06-76RL-01830)
(DE94-003810; PNL-SA-22489; CONF-930928-11) Avail: CASI HC A03/MF A01

A multi-model approach (MMA) to simulating defect production processes at the atomic scale is described that incorporates molecular dynamics (MD), binary collision approximation (BCA) calculations, and stochastic annealing simulations. The central hypothesis of the MMA is that the simple, fast computer codes capable of simulating large numbers of high energy cascades (e.g., BCA codes) can be made to yield the correct defect configurations when their parameters are calibrated using the results of the more physically realistic MD simulations. The calibration procedure is investigated using results of MD simulations of 25 keV cascades in copper. The configurations of point defects are extracted from the MD cascade simulations at the end of the collisional phase, similar to the information obtained with a binary collision model. The MD collisional phase defect configurations are used as input to the ALSOME annealing simulation code, and values of the ALSOME quenching parameters are determined that yield the best fit to the post-quenching defect configurations of the MD simulations. DOE

CROSSOVER BETWEEN BCS AND PERFORMED-BOSON THEORIES WITH INCREASING INTERACTIONS

M. Randeria Aug. 1993 8 p Presented at the International Conference on Strongly Correlated Electron Systems, La Jolla, CA, 16-19 Aug. 1993
(Contract W-31-109-eng-38)
(DE93-019018; ANL/MSD/CP-80489; CONF-930865-1) Avail: CASI HC A02/MF A01

The author reviews recent work on Fermi systems with attractive interactions of arbitrary strength. First, he describes the results of a functional integral formulation to study the crossover from cooperative Cooper pairing to independent bound state formation and condensation. The inadequacy of a saddle point approximation with increasing coupling is pointed out, and the importance of temporal (quantum) fluctuations for normal state properties at intermediate and strong coupling is emphasized. Next, results from a quantum Monte Carlo simulation of the 2D attractive Hubbard model are described. The intermediate coupling normal state is found to deviate markedly from a canonical Fermi liquid; 'spin-gap' behavior, with 1/T(sub 1)T is approximately (chi)(T), is found in a degenerate Fermi system. THE STAR EXPERIMENT AT THE RELATIVISTIC HEAVY ION COLLIDER

J. W. Harris Sep. 1993 9 p Presented at the 10th International Conference on Ultra-Relativistic Nucleus-nucleus Collisions, Borlaenge, Sweden, 20-24 Jun. 1993
(Contract DE-AC03-76SF-00098)
(DE94-003409; LBL-34726; CONF-930636-9) Avail: CASI HC A02/MF A01

The STAR experiments will concentrate on measurements of hadron production over a large solid angle to be able to study observables on an event-by-event basis. STAR will search for signatures of QGP formation and investigate the behavior of strongly interacting matter at high energy density. Since there is no single definitive signature for the QGP, it is essential to use a flexible detection system at RHIC. STAR will simultaneously measure many experimental observables to study signatures of the phase transition and the space-time evolution of the collision process. This requires an understanding of the microscopic structure of hadronic interactions, at the level of quarks and gluons, at high energy densities. The experiment will utilize two aspects of hadron production that are fundamentally new at RHIC: correlations between global observables on an event-by-event basis and the use of hard scattering of partons as a probe of the properties of high density nuclear matter. DOE

THE DELTA (1232) RESONANCE TRANSITION FORM FACTOR

L. M. Staurt (California Univ., Davis.), P. E. Bosted (American Univ., Washington, DC.), and A. Lung (American Univ., Washington, DC.) Aug. 1993 4 p Presented at the Conference on Exclusive Reactions At High Momentum Transfer, Elba, Italy, 24-26 Jun. 1993
(Contracts DE-AC03-76SF-00515; W-7405-eng-48; DE-FG02-88ER-40415; DE-AC02-76ER-13065; DE-FG06-90ER-40537)
(DE94-003442; SU-SLAC-PUB-6316; CONF-9306260-3) Avail: CASI HC A01/MF A01

Old and new measurements of inclusive e-p cross sections in the Delta(1232) resonance region have been combined, and a global data fit has been made. Using this fit to parameterize the nonresonant background, the transition form factors have been extracted out to a four-momentum transfer, Q(sup 2), of 9.8 (GeV/c)(exp 2). The results are systematically higher than those from a previous analysis, but agree within errors. A similar analysis has been done with e-d cross sections, and sigma(sub n)/sigma(sub p) in the Delta(1232) resonance region has been extracted out to a Q(sup 2) of 7.9 (GeV/c)(exp 2). Sigma(sub n)/sigma(sub p) for Delta(1232) production is consistent with unity, while sigma(sub n)/sigma(sub p) for the nonresonant background is constant with Q(sup 2) at approximately 0.4. DOE

A STUDY OF LPM SUPPRESSION OF BREMSSTRAHLUNG AT 25 GeV
P. Anthony (Lawrence Livermore National Lab., CA.), R. Becker-Szendy, and P. Bosted (American Univ., Washington, DC.) Mar. 1993 4 p
Presented at the International Cosmic Ray Conference, Calgary, Alberta, 19-20 Jul. 1993
(Contract DE-AC03-76SF-00515)
(DE94-003457; SU-SLAC-PUB-6096; CONF-930779-18) Avail: CASI HC A01/MF A01

This paper describes progress to date in making accurate measurements of the LPM suppression of bremsstrahlung with 25 GeV electrons. By using a 120 pulses per second beam, a precise BGO calorimeter, and spectrometer to tag the outgoing electrons, an accurate measurement of the bremsstrahlung photons was made in the 0-400 MeV region, where the Bethe Heitler and LPM predictions differ. Data was taken with targets made of carbon, uranium, tungsten, and iron, with thicknesses in the two to six percent X(sub 0) range. In addition, data was taken with two very thin gold targets. The latter have thicknesses that are comparable to or less than the LPM formation zone length, and so should not exhibit LPM suppression. Photons of a few MeV in energy were studied to test the closely related longitudinal density effect predicted by Ter-Mikaelian in which very low energy photon emission is suppressed due to dielectric effects of the medium. DOE

COMPUTATIONAL STUDIES OF ENERGETIC ORGANIC MOLECULES
Peter Politzer and Jane S. Murray 27 Dec. 1993 49 p
(Contract N00014-91-J-4057)
(AD-A274726; TR-65) Avail: CASI HC A03/MF A01

First-principles calculations have been carried out for organic energetic molecules of the following types: nitroaromatics; aliphatic and alicyclic nitramines; highly strained cage-like systems; and high-nitrogen-content molecules. The scope includes both ab initio molecular orbital methods and also density functional procedures, with a specific emphasis on the understanding of factors influencing shock/impact sensitivities and relative stabilities. For each class of compounds mentioned above, structural and electronic properties are discussed, followed generally by a review of calculations relating to the decompositions of some specific members of these classes. The discussion of sensitivity and its relationship to molecular properties focuses upon general correlations that exist within separate categories of compounds, e.g. nitroaromatics and nitramines, and upon exceptions to these relationships which suggest that other factors may play key roles in specific instances. In the area of high-nitrogen-content molecules, the presence of localized N-N bonds appears to be a factor favoring instability/high sensitivity. DTIC

MEASUREMENT OF TAU LEPTON BRANCHING FRACTIONS Ph.D. Thesis
N. A. Nicol 30 Sep. 1993 79 p
(Contract DE-AC03-76SF-00098)
(DE94-003423; LBL-34784) Avail: CASI HC A05/MF A01

Presented are tau(sup -) lepton branching fraction measurements based on data from the TPC/two-gamma detector at PEP. Using a sample of tau(sup -) yields nu(sub tau)K(sup -)pi(sup +)pi(sup -) events, the resonance structure of the K(sup -)pi(sup +)pi(sup -) system is examined and the first measurements of branching fractions for tau(sup -) yields nu(sub tau)K(sub 1)(sup -)(1270) and tau(sup -) yields nu(sub tau)K(sub 1)(sup -)(1400) are obtained. Also described are a complete set of branching fraction measurements in which all the decays of the tau(sup -) lepton are separated into classes defined by the identities of the charged particles and an estimate of the number of neutrals. This is the first such global measurement with decay classes defined by the four possible charged particle species, e, mu, pi, and K. DOE

WHY IS THE HIGGS DOUBLET LIGHT?
G. Dvali Jun. 1993 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601711; IC-93/151) Avail: CASI HC A03 (US Sales Only)

We consider a possible mechanism for the explanation of the doublet-triplet mass hierarchy in the grand unified theories. The Higgs doublet is automatically light since it is related by a certain 'custodial' SU(2)(sub C) symmetry to another doublet which after GUT symmetry breaking becomes an unphysical Higgs. Custodial symmetry may or may not be a part of GUT symmetry. An explicit example of SUSY GUT is constructed. DOE

ELECTRON ENERGY LOSS SPECTROSCOPY IN A CRYSTALLINE ENVIRONMENT USING INNER SHELL IONIZATION
L. J. Allen 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601820; UM-P-92/104) Avail: CASI HC A03 (US Sales Only)

A theory for electron energy loss spectroscopy (EELS) is presented. The focus is on inner shell ionization in a crystalline environment under dynamical electron diffraction conditions which includes dechanneling due to inelastic scattering and in particular to thermal diffuse scattering (TDS). It incorporates ionization kinematics and the associated localization of the interaction from first principles. Appropriate integration over the possible final states of the detected scattered fast electron as well as the ejected target electron is catered for. The theory accounts for ionization by the dechanneled thermally scattered electrons as well as delocalization due to thermal fluctuations in target atom position. This formulation extends previous work which did not explicitly incorporate inelastic scattering into the ionization cross section. The dependence of the EELS cross section on the orientation, thickness and temperature of the specimen will be discussed. Also the influence of incident energy, energy window for the detected energy loss electrons and the acceptance angle of the detector on the cross section will be considered. In a simpler version of the formalism given here, with channeling limited to the incident electron, was successfully applied to energy dispersive x-ray emission spectroscopy and the related technique of atom location by channeling enhanced microanalysis (ALCHEM). SEPARATION AND RECONSTRUCTION OF ELECTRON NEUTRINO INTERACTION IN THE IHEP-JINR NEUTRINO DETECTOR AND BARS DETECTOR [SEPARATSIYA I REKONSTRUKTSIYA VZAIMODEJSTVIJ EHLEKTRONNYKH NEJTRINO V NEJTRINNOM DETEKTORE IFVEH-OLYAL I V DETEKTORE BARS]
M. M. Kirsanov 1992 20 p In RUSSIAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634182; IFVE-ONF-92-33) Avail: CASI HC A03 (US Sales Only)

The algorithm for the search and reconstruction of deep inelastic interactions of electron neutrino in the IHEP-JINR neutrino detector was created. The algorithm is used in the experiment on the search for prompt neutrino, where the electron neutrino flux comprises 7% out of the muon neutrino flux. The 46 events have been found, the background from muon neutrino is 25%. In the WBB exposure and the focusing system off where nu(sub e)/nu(sub mu) approximately = 2.5%, 600 events were found, and the background from muon neutrino was 40%. Possibilities to use the similar algorithm for the BARS detector are considered. DOE

DIFFERENTIAL REGULARIZATION OF A NON-RELATIVISTIC ANYON MODEL
D. Z. Freedman, G. Lozano, and N. Rius (Massachusetts Inst. of Tech., Cambridge.) Jul. 1993 16 p
(DE94-601558; IC-93/183; CTP-2216) Avail: CASI HC A03/MF A01 (US Sales Only)

Differential regularization is applied to a field theory of a non-relativistic charged boson field phi with lambda(phi)(sup *)(phi)(sup 2) self-interaction and coupling to a statistics-changing 0(1) Chern-Simons gauge field. Renormalized configuration-space amplitudes for all diagrams contributing to the phi(sup *)(phi)(sup *)(phi)(phi) 4-point function, which is the only primitively divergent Green's function, are obtained up to 3-loop order. The renormalization group equations are explicitly checked, and the scheme dependence of the beta-function is investigated. If the renormalization scheme is fixed to agree with a previous 1-loop calculation, the 2- and 3-loop contributions to beta(lambda, e) vanish, and beta(lambda, epsilon) itself vanishes when the 'self-dual' condition relating lambda to the gauge coupling e is imposed. C-PERIODICITY AND THE PHYSICAL MASS IN THE 3-STATE POTTS MODEL
R. V. Gavai and L. Polley (Oldenburg Univ., Germany.) Jul. 1993 17 p
(DE94-601551; IC-93/131; TIFR/TH-93-28) Avail: CASI HC A03/MF A01 (US Sales Only)

The standard infinite-volume definition of connected correlation function and particle mass in the 3-state Potts model can be implemented in Monte Carlo simulations by using C-periodic spatial boundary conditions. This avoids both the breaking of translation invariance (cold wall b.c.) and the phase-dependent and thus possible biased evaluation of data (periodic b.c.). The numerical feasibility of the standard definitions is demonstrated by sample computations on a 24 x 24 x 48 lattice. DOE

SPINOR AND ISOSPINOR STRUCTURE OF RELATIVISTIC PARTICLE PROPAGATORS
D. M. Gitman and Sh. M. Shvartsman (Case Western Reserve Univ., Cleveland, OH.) Jul. 1993 8 p
(DE94-601552; IC-93/197) Avail: CASI HC A02/MF A01 (US Sales Only)

Representations by means of path integrals are used to find spinor and isospinor structure of relativistic particle propagators in external fields. For a Dirac propagator in an external electromagnetic field, all Grassmannian integrations are performed and a general result is presented via a bosonic path integral. The spinor structure of the integrand is given explicitly by its decomposition in the independent gamma-matrix structures. A similar technique is used to get the isospinor structure of the scalar particle propagator in an external non-Abelian field. DOE

SPIN FROM ISOSPIN: THE MODEL OF SUPERPARTICLE IN A NON-GRASSMANNIAN APPROACH
M. S. Pljushchay 1992 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634341; IHEP-OTF-92-13) Avail: CASI HC A03 (US Sales Only)

Within a non-Grassmannian approach, the (3+1)-dimensional model of a massless spinning particle with internal even degrees of freedom, described by the isospin vector, is constructed. It is shown that quantization of the model leads to the massless supermultiplet. The generalization of the model to the case of N-extended supersymmetry is carried out. The connection of the proposed model with the supertwistor model of superparticles is traced. DOE

ON THE RELATIVISTIC INVARIANT REPRESENTATION OF ARBITRARY BILINEAR COMBINATIONS OF DIRAC SPINORS
A. V. Shchelkachev 1992 19 p
(DE93-634343; IHEP-OTF-92-45) Avail: CASI HC A03/MF A01 (US Sales Only)

It is demonstrated that, generally, a bilinear combination of two arbitrary four-spinors with one of the sixteen Dirac matrices cannot be expressed via the momentum and spin four-vectors (Pauli and Lubanski vectors). The universal general formula derived contains more four-vectors, corresponding to two three-dimensional base vectors in a particle rest frame perpendicular to the direction of the particle spin. The limit transition to zero masses is discussed. Presented are some specific formulas describing the binary combinations of spinors in the case of elastic scattering for helicity and the 'transversal' amplitudes. DOE

(ETN-94-95339) Avail: CASI HC A07/MF A02

The cross sections for dissociative recombination and dissociative excitation of positive small molecular ions and electrons are presented. An overview of some electron-ion interactions is given. Results of a high resolution dissociative recombination experiment on H2(+) and an attempt to fit the experimental data with a model are presented. The smallest tri-atomic molecular ion, H3(+), is investigated. The dissociative excitation and recombination of D3(+) is described. Several field-ionization experiments, performed to analyze Rydberg products formed in the dissociative recombination of H2(+) are explained. Ionization models are evaluated using the results of a unique experiment, where the quantization of the electron-energy is observed. Some measured cross sections for the production of the negative ion are presented. The results of the measurements of stimulated radiative combination of protons and considerations for the calculation of production gain are included. ESA

CHANCE TO USE W-DECAY LEPTON CHANNELS FOR WIDTH DETERMINATION
A. V. Ivkin (Academy of Sciences, USSR, Alma-Ata.), M. T. Nazirov (Academy of Sciences, USSR, Alma-Ata.), T. V. Kukhto (Belorussian State Univ., Minsk, Belarus.), and E. A. Kuraev 1992 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634438; JINR-E-2-92-90) Avail: CASI HC A02 (US Sales Only)

The prosess of W(+)W(-)-production at e(+)e(-)-collisions as well as the process of single W-boson production in (gamma)e-collision with subsequent W decay via lepton channel were considered. Due to resonance nature of W-boson propagator in an intermediate state, lepton yield has a sharp rise in the region of W-boson production threshold. Lepton-inclusive cross sections were calculated. In the case of two-lepton production their energy fractions and the angle between their momenta in c.m.s. for the majority of events are found to be connected by the condition confining a certain body in 3 dimensional space of these parameters. For the case of single W production the decay lepton energy fraction and its angle with respect to a beam axis play a role of such parameters; their allowed regions being a plane figure. It is shown that measurement of 'smearing' of lepton distribution due to W-boson resonance nature would give quite reliable information on the ratio of the W-boson total width to its mass. Influence of radiation corrections on this distributions is analyzed. DOE

RELATIVISTIC COLLISION RATE CALCULATIONS FOR ELECTRON-AIR INTERACTIONS
Gerald Graham and Robert Roussel-Dupre (EG and G Energy Measurements, Inc., Los Alamos, NM.) Dec. 1993 51 p
(Contracts W-7405-eng-36; DE-AC08-93NV-11265)
(DE94-004204; LA-12604-MS) Avail: CASI HC A04/MF A01

The most recent data available on differential cross sections for electron-air interactions are used to calculate the avalanche, momentum transfer, and energy loss rates that enter into the fluid equations. Data for the important elastic, inelastic, and ionizing processes are generally available out to electron energies of 1-10 keV. Prescriptions for extending these cross sections to the relativistic regime are presented. The angular dependence of the cross sections is included where data are available as is the doubly differential cross section for ionizing collisions. The collision rates are computed by taking moments of the Boltzmann collision integrals with the assumption that the electron momentum distribution function is given by the Juettner distribution function which satisfies the relativistic H-theorem and which reduces to the familiar Maxwellian velocity distribution in the nonrelativistic regime. The distribution function is parameterized in terms of the electron density, mean momentum, and thermal energy and the rates are therefore computed on a two dimensional grid as a function of mean kinetic energy and thermal energy. CONSTRUCTION OF A NEW ELECTROWEAK SPHALERON
F. R. Klinkhamer Jun. 1993 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(NIKHEF-H/93-09; ETN-94-95042) Avail: CASI HC A03

A self consistent ansatz for a new sphaleron in the electroweak standard model is presented. The resulting field equations are solved numerically. This sphaleron sets the height of the energy barrier for the global SU(2) anomaly. A simple procedure to arrive at a new self consistent ansatz was employed: the maximum configuration of a noncontractible sphere, was generated while keeping the symmetries of the configurations of the noncontractible sphere. It is important to note that our maximum configuration is distinguished by an additional symmetry. This construction method can probably also be used to discover other classical solutions. ESA

A SEMICLASSICAL REACTIVE FLUX METHOD FOR THE CALCULATION OF CONDENSED PHASE ACTIVATED RATE CONSTANTS
Diane E. Sagnella, Jianshu Cao, and Gregory A. Voth 11 Jan. 1994 33 p
(Contract N00014-92-J-1243)
(AD-A274850; TR-7) Avail: CASI HC A03/MF A01

A semiclassical reactive flux algorithm for calculating thermally activated rate constants is presented which is based on a semiclassical transition state theory due to Chapman, Garrett, and Miller J. This reactive flux technique, when combined with the semiclassical TST, enables one to describe dynamical recrossings of the transition state on the same footing as tunneling effects. Most importantly, the method is readily applied to nonlinear multidimensional systems over a wide range of temperatures. It will be shown that the method works very well for a variety of existing models. DTIC

The authors present an algorithm for the concurrent solution of the linear system arising from a multigroup, discrete ordinates model of neutron transport. The target architectures consist of distributed memory computers ranging from workstation clusters to massively parallel computers. Based on an analysis of the memory requirement and floating point complexity of matrix-vector multiplication in the iterative solution of the linear system, the authors propose a data layout and communication strategy designed to achieve scalability with respect to all phase space variables. Numerical results are presented to demonstrate the performance of the algorithm on the nCUBE/2. DOE

AN ANTIPROTON-PROTON PARTIAL-WAVE ANALYSIS
R. Timmermans, T. A. Rijken (Nijmegen Univ., Netherlands.), and J. J. deSwart (Nijmegen Univ., Netherlands.) 1993 10 p Presented at the 14th European Conference on Few-body Problems in Physics, Amsterdam, Netherlands, 22-27 Aug. 1993
(Contract W-7405-eng-36)
(DE94-002690; LA-UR-93-3728; CONF-9308164-5) Avail: CASI HC A02/MF A01

Partial-wave analyses (PWA's) have a long history in the fields of pi N and NN scattering. Due to the poor quality of low-energy antiproton beams and the resulting absence of accurate experimental data, analogous model-independent studies of the much more complex bar-p p system have in the past always been impossible. In the pre-LEAR era spin-dependent observables and charge-exchange (bar-p p yields bar-n n) data were almost nonexistent, the situation between 400 and 925 MeV/c is now quite good. High-quality analyzing-power data have been obtained for the elastic and charge-exchange reactions. Very recently, even charge-exchange depolarization data have become available. Unfortunately, the practical difficulties involved in constructing a high-quality 'cooled' antiproton beam of lower momentum are large. Consequently, the bar-p p database below about 400 MeV/c is still by far not as good as one would like, in striking contrast to the pp case where very accurate data exist as low as T(sub L) = 0.35 MeV. It also remains an outstanding experimental challenge to construct a polarized antiproton beam to further probe the spin structure of the interaction. A new method has been developed by the Nijmegen group to perform PWA's of the abundant and accurate NN scattering data below T(sub L) = 350 MeV. With the now available high-quality data from LEAR and KEK, the authors have been able to extend the methods used in these NN PWA's to perform an energy-dependent PWA of all bar-p p scattering data below p(sub L) = 925 MeV/c. The same methods of PWA have also been applied to the strangeness-exchange reaction bar-p p yields bar-Lambda Lambda, for which the PS185 group at LEAR has obtained beautiful data. Theoretical ideas behind these Nijmegen PWA's are reviewed and these ideas and methods are applied to the case of bar-p p scattering. Some results of this bar-p p PWA are presented and discussed. MEASURING THE TIME DEPENDENCE OF B(SUB S)(SUP 0) MESON - ANTI B(SUB S)(SUP 0) MESON OSCILLATIONS M.S. Thesis
Manuella Greta Vincter 1992 176 p
(ISBN-0-315-84367-5; CTN-94-61025) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A Monte Carlo study was made of the possibility of measuring the frequency of oscillation of B/anti-B meson mixing (each meson consisting of an anti-b quark and an s quark), given existing detector technology. A measurement of this oscillation frequency is important since it leads to the determination of one of the elements of the Cabibbo Kobayashi Maskawa quark mixing matrix. The present values of the elements of this matrix suggest that the oscillation frequency lies in the range Delta M/Gamma approximately 2 to 265, although the current best estimates give Delta M/Gamma about equal to 15. The OPAL silicon microvertex detector is used as an example of present-day detector technology. The energy lost by an ionizing particle in a silicon wafer is studied in detail. The phenomenon of B meson oscillations was simulated by computer using a simple model. These simulated events were analyzed by three different methods in an attempt to quantify the number of events needed to achieve a given precision for the measurement of the B meson oscillation frequency. With 200 B mesons detected, a measurement of Delta M/Gamma up to 10 can be made with good precision. CISTI

RYDBERG STATES IN MULTIPLY CHARGED IONS
A. E. Livingston May 1993 5 p
(Contract DE-FG02-92ER-14283)
(DE94-002335; DOE/ER-14283/1) Avail: CASI HC A01/MF A01

This report summarizes research progress in accelerator-based studies of atomic structure and decay characteristics of excited states in multiply charged ions. This work involves spectroscopic measurements in visible to extreme ultraviolet wavelength regions of atomic transitions involving Rydberg states and low-lying excited states in multiply charged ions. These investigations are of both fundamental and applied interest. Of fundamental importance are trusts of long range electron-ion interactions and many-body electron correlations in Rydberg states, sensitivity to relativistic effects in the energy structures of few-electron ions, and tests of accurate many-body calculations of transition probabilities. This has application to understanding of laboratory and astrophysical plasmas and of detailed atomic structure and decay properties in highly charged ions. DOE

CONSTRAINTS ON SINGLET RIGHT-HANDED NEUTRINOS COMING FROM THE Z(0)-WIDTH
C. O. Escobar, O. L. G. Peres, and V. Pleitez Dec. 1992 12 p
Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634393; IFT-P-040/92) Avail: CASI HC A03 (US Sales Only)

The constraints on masses and missing angles imposed by the measured Z(sup 0) invisible width, in a model in which a singlet right-handed neutrino mixes with all the Standard model neutrinos are studied. If neutrinos are massive an important question to be answered concerns the way the Z-pole observables constraint their masses and mixing parameters. In particular the measured Z-invisible width, Gamma(sup inv), implies that the number of families is compatible with three. On the other hand, it is well known that this number need not to be an integer number if right-handed neutrinos transformed as singlets under SU(2)(sub L) x U(1)(sub Y) are added to the particle content of the theory. Experimental searches for sequential neutron leptons beyond the three generations exclude stable Dirac neutrinos below 41.8 GeV and stable Majorana neutrinos below 34.8 GeV. For the unstable cases these values are 46.4 and 45.1 GeV respectively. However, it is worth stressing that these limits are valid for sequential leptons and do not apply to the case of singlets of right-handed neutrinos. Here we will consider the simplest extension of the standard electroweak model with the addition of the one right-handed singlet neutral fermion, resulting in 4 physical neutrinos two of them massless and two massive ones. (DE93-634426; IHEP-OTF-92-71) Avail: CASI HC A02 (US Sales Only)

The formula for calculating the axial decay constant of heavy-light quark mesons has been obtained by means of the QCD sum rules. The calculations are based on the use of excited state mass spectrum of the corresponding system. The calculated values for the charmed mesons are f(sub D) = 145 MeV and f(sub F) = 160 MeV. For B and B(sub s) mesons, the dependences of the decay constants on the b-quark mass are presented. At m(sub b) = 4.55 GeV the results are f(sub B) = 165 MeV and f(sub Bs) = 177 MeV. DOE

Strange Dibaryons, six valence-quark hadrons constructed from one or more strange quarks, are predicted to have greater binding than dibaryons in the non-strange sector. The flavor-singlet dibaryon with quark structure 'uuddss' is of particular theoretical and experimental interest. A brief review of the status of H dibaryon studies is presented with emphasis on experiment E813, which is currently taking data at the AGS. DOE

NUCLEAR THEORY GROUP, UNIVERSITY OF WASHINGTON RECENT AND PLANNED RESEARCH
1993 40 p
(Contract DE-FG06-88ER-40427)
(DE94-002729; DOE/ER-40427/10-N93) Avail: CASI HC A03/MF A01

The work of the five staff members is presented individually in turn. (1) Nonperturbative aspects of quantum chromodynamics and its implication for phenomena involving nucleon structure, nuclear structure, and relativistic heavy-ion collisions. (2) Symmetries and the connection of the quark-gluon description of nucleons and nuclei with the nucleon-meson degrees of freedom-parity nonconservation, time reversal invariance, chiral symmetry and charge symmetry, QCD sum rules. (3) The relation between nuclear physics and quantum chromodynamics-physics of color transparency, fundamental symmetries, physics of confinement and hadronic form factors, EMC effect. (4) Chirally invariant chromo-dielectric soliton model, many-nucleon system in models of QCD, flux tube dynamics, (anti p)-p to (anti Lambda)-Lambda and (anti Lambda)-Sigma collisions, isotopic effects in atomic parity nonconservation, quantum molecular dynamics. (5) Numerical work related to lattice QCD simulations, and analytical work related to model studies of hadronic phenomenology and the development and understanding of new methods. DOE

MOLECULAR SURFACE ELECTROSTATIC POTENTIALS IN THE ANALYSIS OF NON-HYDROGEN-BONDING NONCOVALENT INTERACTIONS
Jane S. Murray, Kim Paulsen, and Peter Politzer 27 Dec. 1993 16 p
(Contract N00014-91-J-4057)
(AD-A274612; TR-66) Avail: CASI HC A03/MF A01

Electrostatic potentials computed on molecular surfaces are used to analyze some noncovalent interactions that are not in the category of hydrogen bonding, e.g. halogen bonding. The systems examined include halogenated methanes, substituted benzenes, s-tetrazine, and 1,3-bisphenylurea. The data were obtained by ab initio SCF calculations. DTIC

LOW-ENERGY HADRONIC INTERACTIONS BEYOND THE CURRENT ALGEBRA APPROACH
A. N. Ivanov (Saint Petersburg Technical Univ., Russia.), N. I. Troitskaya (Saint Petersburg Technical Univ., Russia.), and M. Nagy Jun. 1993 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-602600; IC-93/145) Avail: CASI HC A03 (US Sales Only)

The new low-energy AP(sup 3)-interaction, which is produced by convergent box-constituent-quark-loop diagrams, is obtained within chiral perturbation theory at the quark level (CHPT)(sub q) with linear realization of chiral U(3) x U(3) symmetry. Its contributions to processes of low-energy interactions of low-lying mesons are investigated. The new interaction goes beyond the framework of the low-energy current algebra approach and of the effective chiral Lagrangians with linear realization of chiral symmetry, constructed at the hadronic level. Uzan-Saguy (Technion - Israel Inst. of Tech., Haifa.), S. Prawer, and D. McCulloch (Royal Melbourne Inst. of Tech., Australia.) 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601913; UM-P-93/26) Avail: CASI HC A03 (US Sales Only)

The changes in resistivity of fullerene (C60) films subject to 320 keV Xe ion irradiation are investigated as a function of ion dose. From a comparison of this dependence with similar data on other Xe irradiated C containing insulating materials and with data on C implanted fused quartz, it is concluded that upon ion impact, C60 clusters completely disintegrate. This disintegration releases about 60 C atoms which disperse amongst the remaining intact C60 spheres giving rise to hopping conductivity between isolated C atoms. DOE

D0 RESULTS ON SEARCHES FOR THE TOP QUARK
S. Abachi Sep. 1993 10 p Presented at the 5th International Symposium on Heavy Flavor Physics, Montreal, 6-10 Jul. 1993
(Contract DE-AC02-76CH-03000)
(DE94-003361; FNAL/C-93/287; CONF-9307143-4) Avail: CASI HC A02/MF A01

A search for creation of the top quark in p bar-p collisions was performed at square root of s = 1.8 GeV at Tevatron, Fermilab. Production of t bar-t followed by top decay to W + b quark is assumed. The decay channels were searched for with both W's decaying leptonically, and with one W decay to an electron and the other to quarks. A preliminary report on the status of one interesting event is presented. By combining the results from the ee and e mu channels, a lower top mass limit of 99 GeV on the 95% confidence level is obtained. DOE

CALCULATION OF ELECTRON-POTASSIUM SCATTERING
I. Bray, D. V. Fursa, and I. E. McCarthy Dec. 1992 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601812; ESM-50) Avail: CASI HC A03 (US Sales Only)

Elastic through to 7(sup 2)F differential, integrated, and total cross sections for electrons scattering from the ground state of potassium atoms are presented. Spin asymmetries, L perpendicular for singlet, triplet, and spin-averaged scattering, optical excitation cross sections, and various photon polarization observables for elastic channel and 4(sup P) channel are also discussed. These are calculated using the Coupled-Channel Optical method. A total of 17 target states are explicitly coupled with the effect of the continuum included in the first 6 of these. The calculations have been performed at a range of energies from 1 to 100 eV. The results are generally in good agreement with available experiment data. It was found that the effect of the inclusion of the continuum is most evident in calculating spin asymmetries and singlet spin-resolved L parameter. DOE

SPIN ASYMMETRY IN RESONANT ELECTRON-HYDROGEN ELASTIC SCATTERING
I. E. McCarthy and Bo Shang Feb. 1993 7 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601813; ESM-52) Avail: CASI HC A02 (US Sales Only)

Differential cross sections and asymmetries at 90 deg and 30 deg are calculated for electron-hydrogen elastic scattering over the energies of the lowest (sup 1)S and (sup 3)P resonances using a nine-state coupled-channels calculation with and without continuum effects, which are represented by an equivalent-local polarization potential. The polarization potential improves agreement with experiment in general for the spin-averaged cross sections. It is suggested that continuum effects would be critically tested by asymmetry measurement at 30 deg over the (sup 1)S resonance. DOE

CALCULATIONS OF ASYMMETRIES IN ELECTRON-ALKALI SCATTERING
I. Bray May 1993 5 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601816; ESM-55) Avail: CASI HC A01 (US Sales Only)

In this work it is shown that in order to calculate spin asymmetries at projectile energies above the ionization threshold, the target continuum needs to be taken into account. However, this does not imply that in the experiment, intermediate excitation into the continuum plays a major role. Rather, any theory, such as the standard close-coupling method, that does not allow for electron flux to be in all open channels is likely to have difficulty in reproducing the measured spin asymmetries. DOE

INTERNATIONAL BULLETIN ON ATOMIC AND MOLECULAR DATA FOR FUSION. NO. 46
J. Botero, ed. Jun. 1993 208 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601818; INIS-mf-4754(no-46); IBAMD-46) Avail: CASI HC A10 (US Sales Only)

The bulletin is published by the International Atomic Energy Agency to provide atomic and molecular data relevant to fusion research and technology. In Part 1 the indexed papers are listed separately for (1) structure and spectra (energy levels, wavelengths; transition probabilities, oscillator strengths; interatomic potentials); (2) atomic and molecular collisions (photon collisions; electron collisions; heavy-particle collisions; homonuclear sequences; isoelectronic sequences); and (3) surface interactions (sputtering; chemical reactions; trapping and detrapping; surface damage; blistering, flaking; secondary electron emission). Part 2 contains the bibliographic data for the above listed topics and for high energy laser- and beam-matter interaction; interaction of atomic particles with fields. The atomic and molecular data needs in fusion research, as identified during the IAEA Consultants' Meeting on 'Atomic and Molecular Database for Hydrogen Recycling and Helium Exhaust from Fusion Reactors', June 1992, Vienna, are listed, covering (1) atomic and molecular collision processes, (2) particle-surface interaction processes, and (3) the status of data bases on atomic and molecular data and plasma-surface interactions.

News on the ALADDIN (A labelled Atomic Data INterface) system is provided. Finally, a list of evaluated atomic and molecular data bases is provided.

EXPERIMENTAL INVESTIGATIONS OF STRONG INTERACTION IN THE NON-PERTURBATIVE QCD REGION
S. J. Lindenbaum and S. Samuel Sep. 1993 26 p
(Contract DE-FG02-92ER-40698)
(DE94-001178; DOE/ER-40698/2) Avail: CASI HC A03/MF A01

A critical investigation of non-perturbative QCD require investigating glueballs, search for a Quark Gluon Plasma (OGP), and search for strangelets. In the glueball area the data obtained (E-881) at 8 GeV/c were analyzed for pi(sup -) + p yields phi(phi)n (OZI forbidden), (phi)K(sup +)K(sup -)n (OZI allowed), K(sup -)p yields phi(phi)((Lambda)(Sigma)) (OZI allowed), and (bar p)p yields phi(phi)pi(sup 0) (OZI forbidden), (phi)K(sup +)K(sup -)pi(sup 0) (OZI allowed). By comparing the OZI forbidden (glueball filter reactions) with the OZI allowed and previous 22 GeV/c pi(sup -)p yields phi(phi)n or (phi)K(sup +)K(sup -)n data a further critical test of the so far unsuccessfully challenged hypothesis that our g(sup T)(2010), g(sub T')(2300) and g(sub T")(2340) all with I(sup G)J(sup PC) = 0(sup +)2(sup ++) are produced by 1-3 2(sup ++) glueballs will be made. In the QGP search with a large-solid-angle TPC a good Xi signal was observed. The ratio of Xi to single strange quark particles such as lambda is a better indication of strangeness enhancement in QGP formation. The data indicate enhancement by a factor approximately equal to 2 over cascade model (corrected to observed strangeness) predictions, but it is definitely far from conclusive at this stage since the result is model dependent. Double lambda topologies of the type needed to discover light strangelets in the nanosecond lifetime region were found. In addition, research has been accomplished in three main areas: bosonic technicolor and strings, buckministerfullerene C(sub 60) and neutrino oscillations in a dense neutrino gas. DOE

ANTIPROTON STUDIES IN PENNING TRAPS Final Report, 1 Jul. 1988 - 30 Sep. 1993
Gerald Gabrielse 30 Sep. 1993 19 p
(Grant AF-AFOSR-0306-88)
(AD-A274250; AFOSR-93-0889TR) Avail: CASI HC A03/MF A01

Antiprotons are produced in giant accelerators with typical energies measured in GeV. In the unique LEAR facility of CERN, such antiprotons are decelerated to and cooled at an energy of 5 MeV. The experiments described in this proposal made it possible to slow, store, and study antiprotons at dramatically lower energies, 10(exp 10) times lower than ever realized before. Antiprotons from LEAR are slowed to several KeV by sending them through a metal degrader window of a precisely chosen thickness. They are then captured in a specially designed Penning trap. Once inside the trap, collisions with extremely cold electrons dramatically lower the energy of the trapped antiprotons to thermal equilibrium at 4.2 K. Antiprotons have now been stored for months in thermal equilibrium at 4.2 K, which requires a vacuum better than 5 x 10(exp -17) Torr. The first precision measurement at this new, low energy frontier is a comparison of the inertial masses of the antiproton and proton at an accuracy more than 1000 times greater than was achieved in earlier experiments. The accurate mass spectroscopy is greatly facilitated by the invention of self-shielding superconducting solenoid system which has likely applications to MRI imaging. DTIC

SPECTROSCOPY AND STRONG DECAYS OF BARYONS Ph.D. Thesis
Bao N. Tran Mar. 1989 191 p
(ISBN-0-315-49073-X; CTN-94-60972) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A quark model, suggested by quantum chromodynamics, is used to calculate the entire spectrum of baryons, containing u, d, s, c, and b quarks. A short-range Coulomb potential is used, together with a long-range linear potential, modified by a harmonic oscillator potential. This combination leads to a good description of the masses of both positive and negative parity baryons, based on the five quark masses and four additional parameters related to the chosen potential. The quark pair creation model of Le Yaouanc et al. is then used to study the decay processes N, Delta yielding N pi and Lambda, Sigma yielding NK(-). The pair creation strength gamma is replaced by k raised to the gamma. Beside the meson radius, this is the only parameter of the model. The result is in good agreement with experimental data and confirms the assignment of baryons in the mass calculation. Author (CISTI)

FINDING THE MISSING PIECES OF THE STANDARD MODEL Ph.D. Thesis
David Atwood Jun. 1989 175 p
(ISBN-0-315-57174-8; CTN-94-60973) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The standard model is discussed in general and the predicted, but as yet unobserved, Higgs boson and top quark described. Detection of a top

quark at electron positron colliders and hadron colliders is considered for top-quark mass of under 80 GeV. The detection of the Higgs boson is considered at the Z peak in electron positron annihilation for Higgs-boson masses equal to or less than 60 GeV, as well as in the continuum 100-200 GeV (intermediate mass range). For this range of the Higgs-boson mass, consideration is also given to its detection at the Superconducting Supercollider through the tau-lepton decay mode. A dispersive approach is considered for Higgs boson with large mass, equal to or greater than 500 GeV, in order to estimate nonperturbative self interaction effects.

A STUDY OF THE GLOBAL PROPERTIES OF HADRONIC MATTER AT LARGE DENSITIES Ph.D. Thesis
Francois Lamarche 14 May 1989 201 p
(ISBN-0-315-57234-5; CTN-94-60974) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A study is presented of the properties of nuclear matter under extreme conditions of density and temperature, using collisions of heavy nuclei measured in the NA34 experiment at the CERN super proton synchrotron. The emphasis is on the study of the variation of the properties of average central collisions with the sizes of the colliding nuclei. The projectiles used are 200 GeV protons, 60 and 200 GeV/nucleon O-16 nuclei, and 200 GeV/nucleon S-32 nuclei. The targets are thin disks of Al, Cu, Ag, W, Pt, Pb, and U nuclei. The energy density achieved in these collisions, on the order of 10 GeV/fm(exp 3), is a necessary but not sufficient condition to create a plasma of quarks and gluons. The appropriateness of a hydrodynamic description of the data is examined. From the observation of the work done by the hydrodynamic forces, constraints are obtained on the properties of the hypothetical plasma. Author (CISTI)

The production of colorless clusters (CC) in high-energy e+ e- collisions in the framework of perturbative quantum chromodynamics (QCD) is studied using jet calculus. This approach enables treatment of the cascade of successively generated partons initiated by the virtual photon in terms of quantum mechanical probabilities. Special attention is given to the presence of soft gluons in the cascade, which produce non-negligible quantum mechanical interference contributions. The Crespi-Jones (CJ) approach, ideally suited for studying gluons in a CC, is used throughout. Mueller's criterion of angle-ordered gluon emission is invoked to redefine the evolution variable in the conventional CJ equations to account for soft gluon effects. The method of moments is used to solve the CJ equations. Results are presented in both moment space and longitudinal momentum (x) space. The zeroth moment of the CC distribution in gluon jets is evaluated under certain asymptotic approximations and results for low x are shown to be in fair agreement with other work. Several new algorithms for numerical inversion of moments are presented which are relevant to the study of the low-x region in QCD. Finally, a method based on Gaussian quadrature and singular value decomposition is discussed. The methods are tested on a wide variety of trial functions. Author (CISTI)

MOLECULAR DYNAMICS SIMULATION AND CRYSTAL-FIELD THEORY: PREDICTING THE OPTICAL SPECTRA AND STRUCTURE OF RARE-EARTH DOPED INORGANIC GLASSES Ph.D. Thesis
Guy Cormier Apr. 1993 242 p
(ISBN-0-315-84679-8; CTN-94-61085) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Simulated structural models were developed for two doped inorganic glasses, Na2O-2SiO2-Eu(III) and SiO2-Eu(III). The simulated structure of the base glasses and the local environment of the doped Eu(III) ions were investigated with the help of radial distribution functions, cumulative distribution functions, and bond angle distributions of the various atomic species found in both glasses. A successful validation of the simulated structural model of the Na-Si-Eu glass was performed through a comparison between room temperature absorption and broadband emission spectra of an experimental glass and calculated absorption and emission spectra of the simulated glass. The validation culminated in creation of an indirect link between the simulated model and the corresponding glass, allowing investigation of various spectral properties of rare-earth doped glasses. It is concluded that rare-earth environments are composed of a continuous distribution of local fields which satisfy energetic bonding requirements of the Eu(III) ions. Overall electrostatic and covalent energy of the individual sites has the greatest influence on the electronic spectra. An experimental technique, dilution narrowed laser spectroscopy, was also examined. This technique could eventually lead to the observation of the optical spectrum of isolated rare-earth ions doped in glass fibers. Author (CISTI)

A RELATIVISTIC QUARK MODEL Ph.D. Thesis
Tao Zhang Sep. 1990 162 p
(ISBN-0-315-60926-5; CTN-94-60981) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Color singlet bound states of quark-antiquark systems, which incorporate transverse gluon degrees of freedom, are studied by means of a variational principle within the framework of relativistic quantum field theory. An effective Hamiltonian for quark-antiquark systems which incorporates the effects of a Coulomb plus linear potential and gluon exchange is constructed. Momentum-space integral eigenvalue equations for the bound states are obtained by using a variational principle. The equations are decoupled within an approximation and then solved numerically. Both the variational and basis state expansion methods are used to solve the equations. The method is applied to the charmonium and bottomonium systems. A good fit to the experimental data is obtained. Author (CISTI)

NMR (Nuclear Magnetic Resonance) and NQR (Nuclear Quadrupole Resonance) measurements were made for Pauli paramagnetic UNi2Ga. The temperature dependence of the Knight shift and the nuclear relaxation rate 1/T(sub 1) at the Ga sites were measured between 4.2 K and 290 K. Fermi liquid behavior, that is, temperature-independent Knight shift and 1/T(sub 1) proportional to temperature, was observed over the measured temperature range. A quantitative analysis suggests that the enhancement of the wave-vector dependent susceptibility chi(q) is fairly localized near q approximately zero in the q space. Author (NASDA)

HIGH GAS-EFFICIENCY HYDROGEN NEGATIVE ION SOURCES Ph.D. Thesis
R. M. A. Heeren 4 Dec. 1992 107 p Prepared in cooperation with Stichting voor Fundamenteel Onderzoek der Materie, Amsterdam, Netherlands and Inst. voor Atoom en Molecuulfyusica; sponsored by Nederlandse Organisatie voor Wetenschappelijk Onderzoek, The Hague,

Netherlands and Euratom, Brussels, Belgium Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-232163) Avail: CASI HC A06

The work described in the thesis was undertaken to gain insight into processes contributing to the formation of hydrogenous negative ions in a barium surface conversion source and to optimize the gas-efficiency of such a ion source. The interest in these negative ion source originates from the need for additional heating and current drive of next generation fusion plasmas by 1-1.3 MeV D(sup 0) injection. These high energy neutral deuterium beams can only be produced by the neutralization of fast negative deuterium ions. In chapter two an extensive calculation of the magnetic configuration necessary for a good confinement of the source plasma of the surface conversion source is presented. Chapter three examines the build up of the hydrogen and deuterium concentration in the barium surface more closely. In chapter four, measurements on the energy distributions of surface produced negative ions clearly show a substantial amount of negative ions leaving the surface with an energy up to a value approaching the energy of the incoming particles. In chapter five an experiment is presented which can improve both the gas-efficiency and negative ion output of the driver region of a high power density multicusp volume source. NTIS

OMEGA OMEGA AND RHO+ RHO- PRODUCTION IN TWO PHOTON INTERACTIONS AT ARGUS Ph.D. Thesis
George Tsipolitis 1990 155 p
(ISBN-0-315-63748-X; CTN-94-60966) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The two-photon reactions gamma gamma yielding 2pi+ 2pi- 2pi0 and gamma gamma yielding pi+ pi- pi0 pi0 have been studied by using the ARGUS detector at the e+e- storage ring DORIS 2 at the Deutsches Elektronen Synchrotron. In the 2pi+ 2pi- 2pi0 final state, the production of omega-mesons is observed and in particular the reaction gamma gamma yielding omega omega is seen for the first time. The cross section for gamma gamma yielding omega omega is found to have an enhancement at around 19 GeV/c-squared of about 12 nb. The topological cross sections for the reactions gamma gamma yielding 2pi+ 2pi- 2pi0 and gamma gamma yielding omega pi+ pi- pi0 are also measured. The production of charged rho-mesons is observed in the pi+ pi- pi0 pi0 final state. The cross section for the reaction gamma gamma yielding rho+ rho- is measured for the first time. The cross section did not show a threshold enhancement similar to that found in the reaction gamma gamma yielding rho0 rho0 and is about a factor of four smaller. A spin parity analysis of the rho+ rho- system shows that the cross section is dominated by the two amplitudes J(P) = 0+ and J(P) = 2+ with helicity 2. Author (CISTI)

OBSERVATION OF EXCITED CHARMED MESONS Ph.D. Thesis
Scott Robert Menary 23 Aug. 1989 120 p
(ISBN-0-315-57014-8; CTN-94-60967) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Using a tagged photon spectrometer and a high energy photon beam, Fermilab experiment E691 was able to collect a large sample of fully reconstructed charmed particles. The resulting data set is used to search for P-wave charmed mesons, called D**s. Evidence is found for a state of mass 2459 MeV/c-squared and width 21 MeV/c-squared, which decays to the mesons D+ pi-. The statistical significance of the signal is measured to be greater than five standard deviations. Various arguments suggest that the state is the J(P) = 2+ P-wave charmed meson but neither the spin nor parity is measured directly. The fraction of D+ coming from D**0(2459) is .07 + or - .02. Also, the D**0(2420) yielding D*+ pi- decay observed previously in e+e- experiments is confirmed. Finally, a four standard deviation signal is observed in the D0 pi+ spectrum. This is interpreted as evidence for the decay of the charged counterpart of the D**0(2420) to D*0 pi+, with the neutral from the D*0 decay going unobserved. The mass and width of the state are 2443 MeV/c-squared and 41 MeV/c-squared, respectively. The fraction of D*+ coming from D**0(2420) and the fraction of D*0 coming from the charged counterpart of the D**0(2420) are measured to be consistent. Author (CISTI)

WEAK HADRONIC DECAYS OF HEAVY FLAVOR MESONS Ph.D. Thesis
Nita Sinha 1989 195 p
(ISBN-0-315-55542-4; CTN-94-60969) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A coupled multichannel calculation was performed for various two-body hadronic decays of charmed mesons, with particular attention to the role of the weak annihilation term. A two channel calculation of Cabibbo angle favored D(S)+ yielding vector pseudoscalar meson (VP) results in a satisfactory fit to experimental data. An extension of this to include the omega pi+ mode also satisfies the recent experimental limit. For Cabibbo angle favored D-VP decays, a three channel calculation is performed, coupling the K* pi, K rho and K0 phi states in isospin 1/2. For the Cabibbo angle favored D/D(s) yielding double vector meson decay modes, a similar treatment is followed. Cabbibo angle suppressed modes are also studied in a coupled channel formalism. The D+ yielding rho0 pi+ branching ratio can be fitted in this approach, whereas its un-unitarized amplitude yields a very small value. Some of the other models proposed to study heavy flavor decays are also discussed. An attempt is made to incorporate the effect of final state interactions. The possibility of large D(s)+ yielding eta pi+, eta' pi+ branching ratios is investigated in a theoretical framework. Finally, the effect of final state scattering phases on two-body B decays are studied in view of a possible measurement of the mixing angle from the noncharmed, nonstrange hadronic decays of the bottom mesons. AN ANALYSIS OF MONOJET DATA IN p(BAR-p) COLLISIONS AT SQUARE ROOT OF s EQUAL TO 1.8 TEV Ph.D. Thesis
R. Markeloff 1992 179 p
(Contract DE-AC02-76ER-00881)
(DE94-001822; DOE/ER-00881/T3) Avail: CASI HC A09/MF A02

An analysis is presented of events with a single jet and significant missing transverse energy selected from 4.7 pb(exp -1) of data collected at the Fermilab Tevatron with the CDF detector. The goal is to identify events of the type p bar-p yields Z(sup 0) + jet; Z(sup 0) yields nu bar-nu. Event selection and backgrounds are discussed. The number of observed monojet events is compared to the number of observed Z(sup 0) yields e(+) e(-) events in which the Z(sup 0) is accompanied by a jet. The number of light neutrino species is measured to be N(sub nu) = 2.2 +/- 1.5 and an upper limit on the number of neutrino species is placed at N(sub nu) less than five (90% C.L.). DOE

(DE94-004581; ANL/ER/PP-77881) Avail: CASI HC A03/MF A01

A theoretical investigation has been made on the double excitation processes of He and H(-) by fast proton and anti-proton impact in the MeV/u-energy region. The cross sections are calculated by use of both the close-coupling and the perturbation expansion methods, and the wave functions of target atoms are generated based on the hyperspherical coordinate method. The excitation to the 2p(sup 2) (sup 1)D(sup e) state of H(-) by anti-proton impact is dominant by about three times in comparison with that by proton impact at the incident energy of 0.1 MeV/u. The spectral shape of an ejected electron from the 2s2p (sup 1)p(sup o) state of H(-) at the incident energy of 1.5 MeV/u is consistent with the line profile of the H(-) photodetachment observed by Bryant et al. ALL-COUPLING POLARON GROUND STATE ENERGY IN D-DIMENSION
G. Ganbold and G. V. Efimov (Joint Inst. for Nuclear Research, Dubna, USSR.) Aug. 1993 25 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-603666; IC-93/228) Avail: CASI HC A03 (US Sales Only)

An extension of the Feynman's path integral treatment for polaron ground state energy to an electron moving in D-dimension is obtained for the entire range of electron-phonon coupling constant. The method of equivalent representation of functional integrals was used. In the approach, the leading term of polaron self-energy gives an upper bound of polaron ground state energy and represents an improvement over the known Feynman's variational estimation. A result of this paper is the obtained all-coupling second correction to the leading term, which slightly lowers the polaron energy. Obtained results are in good agreement with known published data. (DE94-603668; IC-93/240) Avail: CASI HC A03 (US Sales Only)

The equilibrium current fluctuations (thermal noise) for low-dimensional degenerate electron gas (one dimensional, two dimensional) bounded in a narrow (short) channel, or in a thin film (three dimensional) have been calculated within the semiclassical Boltzmann-equation approach. The analytical formulas for the autocorrelation functions have been derived for the complete degenerate case. The noise spectrum under ballistic regime of electron transport was found to be non-Lorentzian with decreased zero-frequency plateau and geometrical resonances at high frequencies depending on the size of the channel. The formulas for the conductivity (conductance) derived from the obtained analytical expressions for C(sub 1)(t) are exactly identical to the known formulas, e.g., to Fuchs size-effect formula for the three dimensional case. PROTON ELECTROMAGNETIC FORM FACTOR NEAR THE PROTON-ANTIPROTON THRESHOLD AND QUASINUCLEAR BOUND STATE
G. V. Meshcheryakov and V. A. Meshcheryakov 1993 8 p
(DE94-606458; JINR-E-2-93-88) Avail: CASI HC A02/MF A01 (US Sales Only)

The influence of the PP-bar-state in the unitarity condition on the behavior of the proton form factor in the time-like region is considered. The result obtained earlier on existence of a quasinuclear bound state in the elastic PP-bar-channel is used to estimate its contribution to electromagnetic form factor of the proton. The obtained expression well describes the high precision data of the experiment PS-170 performed at LEAR at CERN and indicates the quantum numbers of the quasinuclear PP-bar bound state near threshold. PI PLUS PI MINUS GAMMA AND K+ K- PRODUCTION IN TWO PHOTON COLLISIONS AT ARGUS Ph.D. Thesis
Kenneth William McLean Jun. 1990 236 p
(ISBN-0-315-63598-3; CTN-94-60964) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The production of the final states K+K- and eta' yielding pi-plus pi-minus in two-photon collisions has been measured using the ARGUS detector. The product of the two-photon width of the eta' meson and the (eta' yielding rho gamma) branching ratio has been determined. The topological cross section for the production of charged kaon pairs in two-photon collisions has been measured and the two-photon widths and interference parameters for the tensor mesons f2(1270), a2(1320), and f2'(1525) have been extracted. The helicity structure assumed for the K+K- continuum contribution has a significant effect on the result. Upper limits have been obtained for the two-photon widths of the glueball candidate states f2(1720) and X(2230). Author (CISTI)

The electron emission yields gamma of a copper surface have been measured under bombardment with Nd(+) and Gd(+) in the energy range 0.1 to 2.6 keV. The ions are extracted from a new laser ion source. For both cases of Nd(+) and Gd(+), gammas are about linear functions of ion energies with threshold about 300 eV and are equal to 0.8 at the bombardment energy of 2 keV. The obtained yields are much higher and the thresholds are lower than many secondary electron emission data reported in the literature. DOE

SEARCH FOR THE TOP QUARK IN THE SINGLE LEPTON + JETS CHANNEL AT D0

H. B. Greenlee Nov. 1993 10 p Presented at the 9th Workshop on Proton-Antiproton Collider Physics, Tsukuba, Japan, 18-22 Oct. 1993
(Contract DE-AC02-76CH-03000)
(DE94-004660; FNAL/C-93/363-E; CONF-9310247-3) Avail: CASI HC A02/MF A01

Standard model top quark pair production at (radical)s = 1.8 TeV was searched. Preliminary results of searches in the single lepton decay modes (i.e. where one top quark decays semileptonically to an electron or a muon and the other top quark decayed hadronically) are presented. We do not find evidence for top quark production in these decay channels. By combining this negative result with our negative result from the dilepton decay channels, a 95% confidence level upper limit on the top quark production cross section for top masses between 80 and 140 GeV/c(sup 2) was obtained. By comparing this cross section upper limit curve with a theoretical production cross section, a lower limit on the top quark mass of 124 GeV/c(sup 2) is obtained. DOE

N94-27752# Fermi National Accelerator Lab., Batavia, IL.

JET PRODUCTION IN MUON SCATTERING AT FERMILAB E665

C. W. Salgado Nov. 1993 5 p Presented at the 23rd International Symposium on Multiparticle Dynamics, Aspen, CO, 13-17 Sep. 1993
(Contract DE-AC02-76CH-03000)
(DE94-004663; FNAL/C-93-345-E; CONF-9309297-1) Avail: CASI HC A01/MF A01

Measurements of multi-jet production rates from Muon-Nucleon and Muon-Nuclei scattering at Fermilab-E665 are presented. Jet rates are defined by the JADE clustering algorithm. Rates in Muon-Nucleon deep-inelastic scattering are compared to Monte Carlo model predictions. Preliminary results from jet production on heavy targets, in the shadowing region, show a higher suppression of two-forward jets as compared to one-forward jet production. DOE

TECHNICAL REPORT OF ISSP. SER. A, NO. 2687: QUANTIZED PERSISTENT CURRENTS OF A QUANTUM DOT IN A STRONG MAGNETIC FIELD

Yshai Avishai and Mahito Kohmoto (Tokyo Univ., Japan.) Jun. 1993 17 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan and Ministry of Science and Development, Jerusalem, Israel
(ISSN 0082-4798)
(JTN-94-80573) Avail: CASI HC A03/MF A01

Equilibrium electron currents and magnetization in an ideal two-dimensional disc of radius R placed in a strong magnetic field H are investigated. The most striking results emerge when the conditions for the existence of edge and bulk states are met, namely R is much greater than a(sub H) = square root of (h-c/eH). When the Fermi energy is locked on a Landau level, the current as a function of electron density is quantized in units of (e/h)(h-omega(sub c)/2), where omega(sub c) is the cyclotron frequency. It is argued that this effect survives against weak disorder. It is also shown that the persistent current has an approximately periodic dependence on 1/H. The calculated magnetization as a function of the magnetic field displays de Haas-van Alphen oscillations modified by finite size effects, thus confirming the earlier results of Sivan and Imry. STUDY OF INVISIBLE NUCLEON DECAY, N APPROACHES NU NU NU BAR, AND A FORBIDDEN NUCLEAR TRANSITION IN THE KAMIOKANDE DETECTOR

Y. Suzuki, Y. Fukuda, K. S. Hirata, K. Inoue, T. Ishida, T. Kajita, K. Kihara, M. Nakahata, K. Nakamura, and A. Sakai et al May 1993 16 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan and University of Pennsylvania, Philadelphia, PA Prepared in cooperation withKamiokanade Collaboration, Kamioka, Gifu, Japan
(ICRR-299-93-11; JTN-94-80576) Avail: CASI HC A03/MF A01

A search was made for anomalous gamma-rays in the energy range between 19 and 50 MeV in the large underground water Cherenkov detector, Kamiokande. No significant excess was found above the known backgrounds. The result was used to set a limit on invisible nucleon decay through n approaches (nu(sub mu))(nu(sub mu))(bar-nu(sub mu)), n approaches (nu(sub e))(nu(sub e))(nu(sub e)), and n approaches (nu(sub tau))(nu(sub tau))(bar-nu(sub tau)). A lower limit on the partial life time tau(sub B) is given by tau(sub B)/Br(gamma) = 1.8 x 10(exp 31) years (90 percent C. L. (Confindence Level)), where Br(gamma) = Gamma(sub gamma)/Gamma(sub tot) is the branching fraction of the gamma-decay to the particle emission of the deexcitation of O-15(sup *). The life time limit becomes tau(sub B) = 4.9 x 10(exp 26) years (90 percent C. L.) for a conservative estimate of B(gamma) = 2.7 x 10(exp -5) assuming a nuclear single particle model. The result was also used for studying forbidden transitions in the O-16 nucleus. The limit for the relative strength of the forbidden transition to the normal transition is less than 2.3 x 10(exp -57) (90 percent C. L.). Author (NASDA)

DYNAMICS OF METASTABLE STATES IN SUPERSONIC BEAMS Ph.D. Thesis

Ofer Sneh May 1991 141 p
(ITN-94-85232) Copyright Avail: Issuing Activity (Tel-Aviv Univ., Exact Sciences Library, Ramat Aviv 69978, Israel)

Experimental studies are presented of triplet-state dynamics in molecules isolated in supersonic beams, including the application of new experimental techniques to the quantitative investigation of several questions related to intersystem singlet-triplet dynamics and intratriplet-manifold reactions. The experiments were performed in a differentially pumped collimated supersonic beam apparatus. The main detector used for the interrogation of excited triplet states was based on Surface-Electron Ejection by Laser Excited Metastables (SEELEM). Other experimental techniques used included Laser Induced Fluorescence (LIF); Laser Induced Phosphorescence (LIP); and Multi-Photon Ionization (MPI). Experimental procedures included: measurements of triplet lifetimes, ranging from 3 to 3,500 microsec; measurements of the relative quantum yields in triplet formation of triplet excitations formed by intersystem crossing (ISC) of excited singlet states;

measurements of the relative radiation rates of excited triplet states; and spectroscopy of directly laser-excited triplet states. ISA

TOPICS IN ELECTROWEAK BARYOGENESIS: THE SPHALERON AND T-VIOLATION Ph.D. Thesis

L. SeungKoog Dec. 1993 121 p
(Contract W-7405-eng-82)
(DE94-004886; IS-T-1684) Avail: CASI HC A06/MF A02

Assuming that beyond the standard model, physics can be parametrized in terms of high dimensional operators, their effects on the energy of the sphaleron and the classical solution of the gauge and Higgs fields are examined. In the absence of fermions, all of the six dimension 6 operators which are SU(2) symmetric have a small effect when calculated perturbatively. However, calculated non-perturbatively, one of the operators alters the boundary conditions of the equations of motion of the Higgs and gauge fields involved, and another operator gives rise to an abrupt change in the sphaleron energy at a small but definite Higgs quartic coupling. The magnitude of the T-violating muon polarization induced by electromagnetic final state interaction in the radiative Kaon decay K(+) yields (mu)(+)(nu)(sub mu)(gamma) is order of 10(exp -3). DOE

MEASUREMENT OF METASTABLE POPULATION DISTRIBUTION IN GADOLINIUM ATOMIC BEAM BY LASER RESONANCE PHOTOIONIZATION METHOD

Koichi Ogura (Japan Atomic Energy Research Inst., Tokai.) and Takemasa Shibata (Japan Atomic Energy Research Inst., Tokai.) Mar. 1993 29 p In JAPANESE; In JAPANESE
(DE94-701194; JAERI-M-93-098) Avail: CASI HC A03/MF A01

Population distribution of metastable state of gadolinium atoms produced by electron beam heating was measured using resonance photoionization. The population distributions followed the Boltzmann distribution and the atomic excitation temperature was determined. The excitation temperature is far lower than that of evaporation surface and nearly equal to the translational temperature of gadolinium atomic beam. This suggests that the excitation energy and the kinetic energy of atoms exchange at high reaction rate in the atomic vapor expanding from the evaporation surface into vacuum. DOE

FULLERENE FABRICATION USING AN ARC FURNACE. CHARACTERIZATION OF THE PRODUCT

E. E. Pasqualini 1993 2 p Presented at the 2nd Argentine Sessions on Materials Science, La Plata, Argentina, 25-28 Oct. 1993
(DE94-603006; INIS-AR-041; CONF-9310181) Avail: CASI HC A01/MF A01 (US Sales Only)

The first studies about fullerenes were based on the clusters formed by laser heating of graphite; later they were produced in gram quantities with carbon evaporation equipment. They were also produced in flames and by induction heating of graphite. In the present work a commercial arc furnace with graphite spectral electrodes three millimeters in diameter, d.c. current 50 Amperes and helium pressure between 40 and 180 torr, was used. The decomposition of electrodes of 40 mm in length was done in 1 minute to obtain 0.3 grams of soot. loluene dissolution with the help of a soxblet was used for the extraction of fullerenes with a yield of 8%. With the evaporation, a solid residue of precipitates was obtained. The precipitates were analyzed with X rays, electronic microscopy, chromatography, mass spectroscopy, nuclear magnetic resonance, FTIR and UV. The quantitative analyses of the fullerene mixture is shown. DOE

THE THREE-DIMENSIONAL HYDROGEN ATOM IN CROSSED MAGNETIC AND ELECTRIC FIELDS

V. S. Melezhik 1993 20 p
(DE94-606301; JINR-E-4-93-94) Avail: CASI HC A03/MF A01 (US Sales Only)

The authors give a solution of the three-dimensional Schroedinger equation for the electron of a hydrogen atom in external electric and magnetic fields of arbitrary mutual orientation. The rearrangement of the energy spectrum due to changing in the mutual orientation of the fields is evaluated by using n=2 multiplet as an example. The calculations agree with the second-order perturbation formulas that exist for the special cases of mutually parallel and orthogonal fields. For another special two-dimensional case which is currently being extensively investigated, namely the hydrogen atom in a strong magnetic field, the approach agrees with advanced calculations by other authors and yields more accurate binding energies for certain of the low-lying excited states that have been considered. MUON TRANSFER RATES IN COLLISIONS OF HYDROGEN ISOTOPE MESIC ATOMS ON BARE NUCLEI: MULTICHANNEL ADIABATIC APPROACH
V. I. Korobov, V. S. Melezhik, and L. I. Ponomarev (Kurchatov, I. V. Inst. of Atomic Energy, Moscow, USSR.) 1992 15 p
(DE94-606752; JINR-E-4-92-358) Avail: CASI HC A03/MF A01 (US Sales Only)

A numerical scheme for solving the problem of slow collisions in the three-body adiabatic approach is applied for calculation of muon transfer rates in collisions of hydrogen isotope atoms on bare nuclei. It is demonstrated that the multichannel adiabatic approach allows one to reach high accuracy results (approximately three percent) estimating the cross sections of charge transfer processes. The method is applicable in a wide range of energies (0.001-50 eV) which is of interest for analysis of muon catalyzed fusion experiments. DOE

FIRST OBSERVATION OF NEUTRAL CURRENT PROTON ELECTRON SCATTERING AT THE SQUARE ROOT OF s = 300 GeV
Takuya Hasegawa (Tokyo Univ., Japan.) Feb. 1993 138 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-701107; INS-J-175) Avail: CASI HC A07 (US Sales Only)

Neutral current proton electron scattering at center of mass energy 295 GeV was observed for the first time, using the newly built proton electron collider HERA (Hadron Elektron Ring Anlage) and the general purpose detector ZEUS. The distributions of Q(sup 2), Bjorken-x(x), and Bjorken-y(y) were compared with the expectation based on the standard electroweak theory and QCD. Regarding the investigation of high-Q(sup 2) region, an event of Q(sup 2) approximately 1000 GeV(exp 2) was observed for the first time. From the x-distribution of the events, a limit on the mass and the coupling of an exotic s-channel resonance of a quark-lepton system (leptoquark) was obtained. The mass limit is 72 GeV (97 GeV) at 95% confidence level for a scalar type leptoquark with a left-handed (right-handed) electromagnetic coupling to ordinary leptons. The leptoquark is assumed to be weak-isoscalar. To realize this experiment, a uranium scintillator sandwich type calorimeter was developed. Equal response to electrons and hadrons (e/h = 1), which is essential for the good energy resolution for hadrons, has been achieved. One of the main characteristics of this calorimeter is a possibility of calibration utilizing its own uranium radioactivity. The grain variation of each channel can be detected with an accuracy of plus or minus one percent. DOE

(DE93-634526; IC-93/149) Avail: CASI HC A03/MF A01 (US Sales Only)

Presented are a systematic study and statistically significant results of different types of correlations in angles, rapidities, and rapidity intervals, between various charged secondary particles produced in inelastic interactions of relativistic nuclei with emulsion at (4.1 to 4.5) A GeV/c. All types of particles are found to be emitted asymmetrically in the azimuthal plane. This asymmetry increases with the decrease of impact parameter. The two particle correlation function is found to be positive except in the extreme projectile fragmentation region. Particles from different kinematical regions are emitted back-to-back in the azimuthal plane. A multiparticle correlation is observed between created particles as well as target fragments. This assumes production of clusters. These clusters seem to be formed during the decoloring process. Investigations are being carried out to reveal the characteristics of these clusters. DOE

COMPUTER SIMULATION OF AQUEOUS Na-Cl ELECTROLYTES
G. Hummer, D. M. Soumpasis (Max-Planck-Inst. fuer Biophysikalische Chemie, Goettingen, Germany.), and M. Neumann (Wien Univ., Austria.) 1993 13 p Presented at the 2nd Liquid Matter Conference, Florence, Italy, 18-22 Sep. 1993
(Contract W-7405-eng-36)
(DE94-002622; LA-UR-93-3570; CONF-9309267-1) Avail: CASI HC A03/MF A01

Equilibrium structure of aqueous Na-Cl electrolytes between 1 and 5 mol/l is studied by means of molecular dynamics computer simulation using interaction site descriptions of water and ionic components. Electrostatic interactions are treated both with the newly developed charged-clouds scheme and with Ewald summation. In the case of a 5 mol/l electrolyte, the results for pair correlations obtained by the two methods are in excellent agreement. However, the charged-clouds technique is much faster than Ewald summation and makes simulations at lower salt concentrations feasible. It is found that both ion-water and ion-ion correlation functions depend only weakly on the ionic concentration. Sodium and chloride ions exhibit only a negligible tendency to form contact pairs. In particular, no chloride ion pairs in contact are observed. DOE

HDR REACTOR CONTAINMENT FIRE MODELING WITH BRI2
John A. Rockett (National Bureau of Standards, Washington, DC.), Olavi Keski-Rahkonen, and Liisa Heikkila Sep. 1992 89 p Sponsored by Ministry of Trade and Industry, Finland; Finnish Center of Radiation and Nuclear Safety, Helsinki; Imatran Voima Oy, Finland; Teollisuuden Voima Oy, Finland; and Suomen Atomivakuutuspooli, Finland
(ISSN 1235-0621)
(VTT-PUBS-113; ISBN-951-38-4231-2; ETN-94-95232) Copyright Avail: CASI HC A05/MF A01

Fire tests at the German test reactor, HDR, were simulated using a Japanese zone model code, BR12. For potential users of fire models, the process by which model inputs for a complex building are developed and debugged, are illustrated. Eight and ten room models of the containment building were developed. Critical phenomena occurring during simulation were explored. BR12 must be exercised where a side wind increases entrainment by the fire plume. Horizontal vents were described by effective vertical vents. Effect of location of the vent to ambient was found critical during severely oxygen limited burning. The importance of blowing of the fire by the door jet generated. ESA

HADRON JETS AND NUCLEON CLUSTERS IN THE RELATIVISTIC NUCLEAR COLLISIONS
L. A. Didenko, V. G. Grishin, and A. A. Kuznetsov 1991 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-613434; JINR-E-1-91-323) Avail: CASI HC A03 (US Sales Only)

The production of hadron jets and nucleon clusters has been investigated in different hadron and nuclear reactions over an energy range from 4.0 to 205 GeV. The characteristics of hadron jets and nucleon clusters are studied in terms of a new relativistic invariant approach in a relative four-velocity space. It has been observed that the properties of hadron jets in soft and hard interactions and nucleon clusters with temperature T(sub 1) = 60-70 MeV are universal, i.e. independent of neither the type of fragmenting system nor collision energy. The asymptotic regime occurs at (radical)S greater than or approximately equal to 6 GeV for hadron jets and at p greater than or approximately equal to 4.2 x AGeV for nucleon clusters. The dependence of cluster temperature on proton multiplicity in the nucleon cluster was obtained. It was also shown that nucleon clusters under consideration can be interpreted as a decay product of multinucleon resonances with a width of about a few MeV. DOE

A RESEARCH PROGRAM IN EXPERIMENTAL AND THEORETICAL HIGH ENERGY PHYSICS Progress Report, 1 Jun. 1992 - 31 May 1993
R. Brandenberger, D. Cutts, and H. M. Fried et al 1 Jun. 1993 80 p
(Contract DE-FG02-91ER-40688)
(DE94-002156; DOE/ER-40688/2) Avail: CASI HC A05/MF A01

The main emphasis in the theoretical program has been in the area of string theory; also investigated were confinement and other aspects of QCD, electroweak symmetry breaking, and electroweak baryogenesis. The research program in computational physics concentrated on the development of the source Galerkin method of numerical quantum field theory. One portion of the experimental program dealt with interactions of leptons and hadrons from accelerator and strophysics sources. A description of the Large Volume Detector at Gran Sasso and its use as a stellar collapse monitor is given, along with an account of research and development on resistive plate counters. The rest of the experimental program concerns hadron collider and neutrino physics, with major emphasis on the D0 experiment at the Tevatron. The commissioning of the D0 detector and its operation are described, along with D0 analysis. Also reported is a novel cryogenic technique utilizing superfluid helium for neutrino calorimetry. DOE

RELATIVISTIC HEAVY ION PHYSICS
J. C. Hill and F. K. Wohn 1993 42 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract DE-FG02-92ER-40692)
(DE94-003161; DOE/ER-40692/2) Avail: Issuing Activity (Department of Energy (DOE))

This is a progress report for the period May 1992 through April 1993. The first section, entitled 'Purpose and Trends,' gives background on the recent trends in the research program and its evolution from an emphasis on nuclear structure physics to its present emphasis on relativistic heavy ion and RHIC physics. The next section, entitled 'Physics Research Progress,' is divided into four parts: participation in the program to develop a large detector named PHENIX for the RHIC accelerator; joining E864 at the AGS accelerator and the role in that experiment; progress made in the study of electromagnetic dissociation, the highlight of this endeavor being an experiment carried out with the Au-197 beam from the AGS accelerator in April 1992; and progress in completion of the nuclear structure studies. In the final section a list of publications, invited talks, and contributed talks is given. DOE

JLC-1
Dec. 1992 249 p
(DE93-520380; KEK-92-16) Avail: CASI HC A11/MF A03

The JLC project is the post-Tristan high energy physics program that was recommended by the High Energy Committee in 1986. The project consists of the construction of a linear collider and the development of the experiments that will use it, at an initial center of mass energy around 500 GeV. The machine will eventually reach 1.5 TeV through planned upgrades. According to the recommendation, a systematic research and development program was begun, and many remarkable results have been produced. The recent precision measurement at LEP has greatly enhanced the importance of an e(+)e(-) linear collider to explore the energy region just above LEP. The construction of the JLC-1 is proposed. The main purpose of the JLC-1 is to search for the Higgs boson and the top quark which are the two missing constituents of the Standard Model. The physics related to this search is described. The technical feasibility of the construction of the JLC-1 accelerator is considered. The klystrons that can emit a peak power of about 100 MW and experimentally verify the high acceleration gradient of 100 Mv/m are the target of the research and development. The physics, detectors, the accelerator, the time schedule, the cost estimation, and other factors are described. DOE

REGROUPING OF THE BEAM IN THE IHEP PS FOR THE UNK p-p PROGRAMS
E. A. Myae, E. S. Nelipovich, P. T. Pashkov, and A. V. Smirnov 1992 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634021; IHEP-OKU-92-83) Avail: CASI HC A03 (US Sales Only)

Possibilities to form particle bunches in the IHEP machine whose longitudinal parameters would satisfy the requirements imposed by the UNK p-p programs are analyzed. In the case of the 3 x 3 TeV p-p program the accelerated proton beam in the IHEP PS after preliminary quasiadiabatic debunching process will be recaptured into a stable oscillating mode at 33.3 MHz. The peculiarities of the RF system designed for these purposes with an account of strong beam loading are discussed. For the 0.4 x 3 TeV UNK colliding beam regime, it is necessary to compress the accelerated proton bunches in the IHEP PS so that their length will be 4 times less. The main difficulties arising during 'RF gymnastics' which is used for beam compressing, are caused by nonlinearities of the external accelerating field and also the fields induced in the RF cavities by the beam. The compensation of such effects with the help of the special RF system is discussed. DOE

LONGITUDINAL DIFFUSION OF A PROTON BUNCH UNDER EXTERNAL NOISE
S. V. Ivanov 1992 38 p In RUSSIAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634022; IHEP-UNK-92-43) Avail: CASI HC A03 (US Sales Only)

Evolution of longitudinal distribution of a proton bunch subjected to stationary (amplitude or phase) RF-noises is governed by a diffusion equation. Its diffusion coefficient is essentially nonlinear and, possibility, diverges near separatrix. The paper deals with the dynamical foundations of this diffusive approximation. Treated in detail is the motion of particles located either inside, or outside stationary buckets (beam halo). The formal statement of boundary-value problem for the noise-induced diffusion of a bunch (zero boundary conditions at separatrix, or at infinity) is discussed. Both these problems are solved numerically for arbitrarily long bunches. Use is made of the Finite Element Technique (spatial discretization), and of the Crank-Nicolson's scheme (time-domain integration). Computed estimates of the representative bunch life-times for the wide-band (white) noise approximation are presented. These emerge from the criteria of either bunch quality degradation, or of its population loss. DOE

ON A THEORY OF TWO-BEAM MECHANISMS OF CHARGED PARTICLE ACCELERATION IN ELECTRODYNAMIC STRUCTURES
A. O. Ostrovsky (Kharkov State Univ., USSR.) Sep. 1993 29 p
(Contract DE-AC03-76SF-00098)
(DE94-003482; LBL-34729) Avail: CASI HC A03/MF A01

This work is devoted to the theoretical studies of two-beam mechanisms of charged particle acceleration in electronic structures. The first section continues the outline of results of theoretical studies commenced in the intermediate report and considers the two-beam scheme of acceleration in the plasma waveguide. According to this scheme the strong current relativistic electron beam (REB) excites the intensive plasma waves accelerating the electrons of the second beam. The driving beam is assumed to be density modulated. The preliminary modulation of the driving REB is shown to enhance substantially the acceleration efficiency of relativistic electrons of the driven beam. The second section deals with the two-beam acceleration in the vacuum corrugated waveguide. According to this scheme the excitation of electromagnetic waves and acceleration of driven beam electrons by them is accomplished under different Cherenkov resonances between the particles of beams and the corrugated waveguide field. The electromagnetic field in the periodic structure is known to be the superposition of spatial harmonics. With the small depth of the periodic nonuniformity, the amplitudes of these harmonics decrease fast with their number increasing. Therefore, if the driving beam is in the Cherenkov resonance with the first spatial harmonic and the driven beam is in resonance with the zero space harmonic then the force accelerating the driven beam would be considerably bigger than the force decelerating the driving beam electrons. DOE

PROCEEDINGS OF THE SECOND EGS4 USER'S MEETING IN JAPAN
Hideo Hirayama, ed., Yoshihito Namito, ed., and Syuichi Ban, ed. Dec. 1992 70 p Meeting held in Tsukuba, Japan, 20-22 Jul. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-520383; KEK-Proc-92-16; CONF-9207216) Avail: CASI HC A04

This report is the summary of the lectures in second EGS4 study meeting held under the auspices of the Radiation Safety Management Center at National Laboratory for High Energy Physics, from July 20 to 22, 1992. In the study meeting, 79 people took part, and the new users of EGS4 seem to expand, taking the opportunity of this study meeting. In 13 lectures on the research using EGS4, the stories in wide fields were able to be heard. The interchange of the researches in various fields was able to be carried out through the common means of EGS4, and it was significant. DOE

A CURRENT EVALUATION OF THE DIGITAL BEAMFORMING TESTBED AT ROME LABORATORY Technical Report, Jul. 1992 - Jul. 1993
William R. Humbert and Hans Steyskal Sep. 1993 42 p
(AD-A274311; RL-TR-93-198) Avail: CASI HC A03/MF A01

The purpose of this report is to provide a recent evaluation of the digital beamforming (DBF) testbed at Rome Laboratory, Hanscom AFB, MA. Section 1 of the report provides a brief introduction to digital beamforming and some of the associated concepts. Section 2 briefly discusses each component of the digital beamforming system (form and function) in a top-down fashion. Section 3 discusses some system limitations associated with the receiver architecture and outlines the techniques used to investigate these limitations. Section 4 contains the measurement results, which show in-phase and quadrature errors approximately 27 dB below the signal, and dc offsets approximately 37 dB below the signal. Third order harmonics are also approximately equal 37 dB below the signal. Amplitude variation among the channels is + or -2 dB. Removal of the dc offset error had little effect on a 40 dB Taylor pattern. However, removal of the in-phase and quadrature errors (the dominant errors) greatly improved the pattern. Also included are simple examples of super-resolution of two sources spaced about 1/2 beamwidth apart, and of open-loop adaptive nulling for a 20 dB Taylor pattern. DTIC

ANALYTICAL STUDY OF BEAM HANDLING AND EMITTANCE CONTROL Final Report
James R. Thompson and M. L. Sloan Dec. 1993 142 p
(Contract N00014-88-C-0542)
(AD-A274412; I-ARA-93-U-60) Avail: CASI HC A07/MF A02

The thrust of our research on beam handling and emittance control was to explore how one might design high current electron accelerators, with the preservation of high beam quality designed as the primary design consideration. We considered high current, induction linacs in the parameter class of the ETA/ATA accelerators at LLNL, but with improvements to the accelerator gap design and other features to permit a significant increase in the deliverable beam brightness. Our approach for beam quality control centered on the use of solenoidal magnetic focusing through such induction accelerators, together with gently-shaped (adiabatic) acceleration gaps. This approach offers several tools for the control of beam quality. The strength and axial variation in the solenoidal magnetic field may be designed, as may the length and shape of the acceleration gaps, the loading of the gaps, and the axial spacing from gap to gap. This research showed that each of these design features may individually be optimized to contribute to improved beam quality control, and by exploiting these features, it appears feasible to produce high current, high energy electron beams possessing breakthrough beam quality and brightness. Applications which have been technologically unachievable may for the first time become possible. One such application is the production of high performance free electron lasers at very short wavelengths, extending down to the optical (less than 1 micron) regime. DTIC

IMPLEMENTATION OF A COMPACT MAGNETIC ELECTRON ENERGY SPECTROMETER FOR INTENSE RELATIVISTIC ELECTRON BEAMS Interim Report
J. A. Gregor and J. A. Antoniades 5 Nov. 1993 23 p
(AD-A274451; NRL/MR/6756-93-7406) Avail: CASI HC A03/MF A01

A diagnostic used for measuring the energy of 1 to 5 MEV pulsed electron beams by means independent of the beam generating device is investigated. The method employed is capable of collecting the required data optically in a single pulse. The beam energy is measured using a magnetic electron spectrometer coupled with a scintillating material. Using a polaroid camera to collect data, the energy of electron beams from two field emission diode accelerators is measured. The first is a nominal 1 MEV, 16 kA, 25 ns FWHM electron beam and the second is a nominal 5 MEV, 20 kA, 50 ns FWHM electron beam. A detailed study of measurement accuracy and possible sources of error was accomplished. DTIC

The primary goal of the EXCEDE III (Excitation by Electron Deposition) atmospheric energy deposition experiment was to monitor the spatial distribution of the energy deposition profile produced by the approximately 18 Ampere approximately 2.5 keV electron beam. During the rocket flight on April 27, 1990, prompt emission at 391 4 A from the N2(+) (1N) 0-0 transition were measured by a UV scanning photometer. The intensity profiles were inverted to obtain profiles of energy deposition by the beam. DTIC

The effects of electromagnetic-production processes due to two-photon exchange in nucleus-nucleus collisions are discussed. Feynman diagrams for two-photon exchange are evaluated using quantum electrodynamics. The total cross section and stopping power for projectile and target nuclei of identical charge are found to be significant for heavy nuclei above a few GeV per nucleon-incident energy. Author

THEORY AND MODELING OF STIMULATED RAMAN SCATTERING
J. C. VandenHeuvel Jun. 1993 86 p
(AD-A273755; FEL-93-A135; TDCK-TD-92-1737) Avail: CASI HC A05/MF A01

A three-dimensional finite difference method is presented for the propagation through a gain medium of beams focused by an astigmatic lens. The method is used for the modeling of a Raman amplifier that uses astigmatic lenses. With this method, the effect of gain focusing on the amplification is studied. The numerical results show a good correspondence with analytical models in the range where these models are applicable. The threshold power of stimulated Raman scattering (SRS) has been calculated for various nondiffraction-limited pump beams using the numerical model. It is shown that the threshold power, for a tightly focused beam, depends on the M squared factor that is related to the pump beam quality. Additionally, the influence of the exact pump beam profile on the threshold is small. Therefore, the M squared factor is a useful parameter for analyzing the experimental threshold. We show that the measured SRS thresholds in methane correspond with the calculated thresholds. DTIC

CHARACTERIZATION OF AN LCD FOR USE AS A PROGRAMMABLE PHASE SHIFTER TO PRODUCE A SINGLE-LOBED FAR-FIELD PATTERN IN A PHASED ARRAY M.S. Thesis
Gregory S. Kenyon Dec. 1993 71 p
(AD-A273883; AFIT/GAP/ENP/93D-05) Avail: CASI HC A04/MF A01

The liquid crystal display (LCD) from an inexpensive pocket television was converted to a spatial light modulator (SLM) for the purpose of altering the phase front of a ten element diode laser array to produce a single lobe far field pattern. Characterization of the SLM determined the amount of phase shift, amplitude modulation and polarization rotation properties. Nonuniformities within the phase shifter and insufficient phase shift prevented the formation of a single lobe. However, a very limited phase grating was created and analyzed. LCDs from inexpensive commercial pocket televisions were found unsuitable for use as phase shifting spatial light modulators. DTIC

IMPROVED QUALITY OF RECONSTRUCTED IMAGES THROUGH SIFTING OF DATA IN STATISTICAL IMAGE RECONSTRUCTION M.S. Thesis
Craig A. Stoudt Dec. 1993 151 p
(AD-A273884; AFIT/GEO/ENP/93D-03) Avail: CASI HC A08/MF A02

The U.S. Air Force employs adaptive optics systems to produce images of exo-atmospheric objects. Typically, a large set of short exposure images are collected, re-centered to compensate for random image motion, averaged together to improve the signal to noise ratio, and then processed to form a reconstructed image. It is known that some short exposure images will be better than others, so some researchers have suggested that image quality can be improved by selecting a subset of the short exposure images according to some quality criterion, and then processing the average of this subset to form a single, high quality image. This thesis investigates the statistical implications of using frame selection as a post-processing technique to enhance images of exo-atmospheric objects measured by Air Force adaptive optics systems. The results demonstrate that frame selection narrows the optical system point spread function, which reduces image blurring, and increases the frequency spectrum signal to noise ratio, particularly in the mid-frequency range. For extended objects, the technique is light level dependent: for a 1 meter adaptive optics telescope, frame selection will yield an increase in signal to noise ratio for objects brighter than visual magnitude +2.3. PERFORMANCE IMPACTS FOR ACTUATOR MISALIGNMENTS AND FAILURES IN LARGE-APERTURE ADAPTIVE-OPTIC TELESCOPES M.S. Thesis
Timothy D. Hogan Dec. 1993 106 p
(AD-A273838; AFIT/GSO/ENP/93D-01) Avail: CASI HC A06/MF A02

Large-aperture telescopes require adaptive optics in order to compensate for atmospheric turbulence which would otherwise negate the resolution advantages of using large apertures. This investigation analyzes the impacts of misalignments and failures, in the deformable mirror actuators, upon the performance of such systems. A numerical simulation of a standard adaptive optics system is used to generate characteristic optical transfer function (OTF) and signal-to-noise ratio (SNR) performance metrics. The performance impacts of the misalignments are shown to be dependent upon the Fried parameter (effective telescope diameter), the source object brightness, and the control system time delay. The degree of performance degradation is directly related to the relative value of the Fried parameter to the deformable mirror displacement (misalignment cases) and the effective actuator spacing (actuator failure cases). The results indicate that the impact of misalignments and failures is small when seeing conditions are good or the percentage misalignments and failures are small. DTIC

DESIGN OF A SHARED COHERENT CACHE FOR A MULTIPLE CHANNEL ARCHITECTURE M.S. Thesis
John A. Reisner Dec. 1993 112 p
(AD-A274026; AFIT/GCS/ENG/93D-19) Avail: CASI HC A06/MF A02

The Multiple Channel Architecture (MCA) is a recently proposed computer architecture which uses fiber optic communications to overcome many of the problems associated with interconnection networks. There exists a detailed MCA simulator which faithfully simulates an MCA system, however, the original version of the simulator did not cache shared data. In order to improve the performance of the MCA, a cache coherency protocol was developed and implemented in the simulator. The protocol has two features which are significant: (1) a time-division multiplexed (TDM) communication bus is used for coherency traffic, and (2) the shared data is cached in an independent cache. The modified simulator was then used to test the protocol. Two applications and six test configurations were used throughout the testing. Experiment results showed that the protocol consistently improved system performance. Also, a proof-of-concept experiment indicated that performance improvements can be attained by varying cache parameters between the independent shared and private data caches. DTIC

PERFORMANCE COMPARISON OF SHEARING INTERFEROMETER AND HARTMANN WAVE FRONT SENSORS M.S. Thesis
Timothy L. Pennington Dec. 1993 91 p
(AD-A274031; AFIT/GE/ENG/93D-31) Avail: CASI HC A05/MF A01

The resolution of optical imaging systems is severely degraded from the diffraction limit by the random effects of the atmosphere. Techniques exist to compensate for the atmospheric turbulence, one of which is adaptive optics. A critical component in the adaptive optics system is the wavefront sensor. Presently, two types of sensors are being used: the Hartmann-Shack wavefront sensor and the shearing interferometer. Previous studies have compared these two sensors and found them to perform identically for a point source. However, to date, no comparison has been performed for an extended source and subaperture spacing larger than the correlation length of the atmosphere, ro. This thesis has examined this problem and compared these two sensors for the above conditions. Results indicate that the sensors have comparable performance when an infinite number of photons are available. However, the photon limited cases indicate superior performance by the Hartmann sensor. STUDIES OF NON-LINEAR OPTICAL EFFECTS FOR AGILE BEAM STEERING Final Report, 1 May 1988 - 31 Jul. 1991
F. Vachss, I. McMichael, and P. Yeh Nov. 1993 28 p
(Contract N00014-88-C-0231)
(AD-A273998; SC5545.FR) Avail: CASI HC A03/MF A01

The objective of this program is the demonstration of a new technique for massless beam steering of high energy laser radiation. Using the effect of nonlinear electrostriction in acousto-optic devices, we show large improvements in diffraction efficiency and resolution. These results are obtained through the development of a novel geometry for acousto-optic beam steering and of a prototype device designed to take advantage of this geometry. Theoretical and experimental results of this effort establish the validity of large aperture, high frequency nonlinear acousto-optic beam steering. The results are found to be applicable to steering of high power laser beams. DTIC

MITSUBISHI 3-5 MICROMETERS IR IMAGER FOR MACHINE-VISION/ATA APPLICATIONS Final Report, 1990 - 1993
David B. Hillis Nov. 1993 17 p
(AD-A273812; ARL-TR-304) Avail: CASI HC A03/MF A01

Presented in this report are the results of a study conducted to test the performance of the Mitsubishi model 5120C IR Imager as part of an automatic target acquisition (ATA) system. The study was conducted in two phases. The first was directed toward a detailed analysis of the images produced by the Mitsubishi sensor, with the aim of identifying any artifacts or characteristics that might elude the human observer but still affect the ATA system's performance. The second phase involved extensive field testing using the Mitsubishi sensor with two ATA systems: one based on the VME (Versa Module European) bus standard and the other based on a PC. The Mitsubishi sensor showed very good performance in almost all tests and appears to be an excellent choice for ATA/machine-vision applications. Frame-by-frame analysis of digitized image sequences from the Mitsubishi sensor failed to uncover any hidden problems, and several weeks of field testing with two different ATA systems demonstrated high-quality performance. MICROTUBULES FOR NONLINEAR OPTICAL LIMITING Final Report
Stephen T. Wellinghoff, Charles K. Baker, Martin J. Sablik, Ralph H. Hill, and David W. Naegeli 3 Dec. 1993 98 p
(SwRI Proj. 01-3165)
(AD-A273940) Avail: CASI HC A05/MF A02

The effort in visible laser eye and sensor protection has focussed on several problems, one of which was the threshold for laser eye damage of 1.0-0.1 microjoule (micro J)/sq cm (or 1000-100 W/sq cm for a nanosecond pulse) over a broad wavelength range form 400-700 nm. This value is the so-called 'clamping threshold' which is the maximum intensity permitted to exit the optical device, regardless of the input intensity. The most interest was concentrated in finding a solution for nanosecond threats by a retrofit of existing equipment (binoculars, periscope viewers, etc.,) or by fabrication into a simple set of goggles or a visor. This very low clamping threshold, or course, requires a very highly nonlinear material that is fast and operates over a wide frequency range. The nonlinear materials work can be classified into the following types: (1) liquid crystals; (2) organometallics and polymers; (3) ultrarapid crystallizing alloys and other thermally induced phase changes; and (4) phase conjugate mirrors. DEVELOPMENT OF A MULTI-SENSOR IN SITU FIBER OPTIC FLUOROMETER
S. E. Lohrenz, V. L. Asper, M. J. Morris (Ocean Optics, Inc., Dunedin, FL.), and R. A. Walters (Ocean Optics, Inc., Dunedin, FL.) Nov. 1993 27 p
(Contract DE-FG02-92ER-61443)
(DE94-003399; DOE/ER-61443/2) Avail: CASI HC A03/MF A01

The objective is to develop and evaluate a multi-sensor in situ fiber optic fluorometer. The instrument is designed to sample and store in vivo strobe-stimulated fluorescence data at multiple depths and high frequencies (1 Hz). This information may be used for estimating the distribution and abundance of particulate pigment biomass, for supporting models of water column primary production, and as a complement to remotely sensed ocean color estimates of pigment biomass. The instrument is unique in that it uses fiber optic technology to increase vertical resolution. While it is theoretically possible to accomplish this task using a large number of commercially available fluorometers, the proposed design would provide a less expensive approach. Two prototype instruments have been built and are being tested. The first, a single sensor instrument interfaced with a 486 personal computer, has been used to optimize hardware and sensor design and to evaluate fiber performance and instrument detection limits. The second instrument, containing eight sensors and capable of autonomous operation with time-series data acquisition and storage, was recently deployed in a cruise in the Gulf of Mexico. Preliminary results indicate that the instrument meets all the project goals and that low cost, high frequency, high spatial resolution fluorescence data are obtainable with the current design. DOE

PECULIARITIES AND APPLICATION PERSPECTIVES OF METAL-ION IMPLANTS IN GLASSES
P. Mazzoldi (Padua Univ., Italy.), F. Gonella (Padua Univ., Italy.), G. W. Arnold, G. Battaglin (Venice Univ., Italy.), and R. Bertoncello (Padua Univ., Italy.) 1993 50 p Presented at the Nuclear Instruments and Methods in Physics Research on Radiation Effects in Insulators, Nagoya, Japan, Sep. 1993
(Contract DE-AC04-94AL-85000)
(DE94-004671; SAND-93-3826C; CONF-9309259-3) Avail: CASI HC A03/MF A01

Ion implantation in insulators causes modifications in the refractive index as a result of radiation damage, phase separation, or compound formation. As a consequence, light waveguides may be formed with interesting applications in the field of optoelectronics. Recently, implantation of metals ions (e.g. silver, copper, gold, lead) showed the possibility of small radii colloidal particles formation in a thin surface layer of the glass substrate. These particles exhibit an electron plasmon resonance which depends on the optical constants of the implanted metal and on the refractive index of the glass host. The nonlinear optical properties of such colloids, in particular the enhancement of optical Kerr susceptibility, suggest that the ion implantation technique may play an important role for the production of all-optical switching devices. In this paper an analysis of the state-of-the-art of the research in this field will be presented in the framework of ion implantation in glass physics and chemistry. DOE

COMPARISON OF TECHNOLOGY FOR HIGH-POWER LASER MIRRORS AND SYNCHROTRON RADIATION MIRRORS
H. E. Bennett (Naval Air Warfare Center, China Lake, CA.) and A. M. Khounsary 1993 18 p Presented at the Annual Meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA, 11-16 Jul. 1993
(Contract W-31-109-eng-38)
(DE94-002913; ANL/XFD/CP-81152; CONF-930722-53) Avail: CASI HC A03/MF A01

There are obvious differences but some surprising similarities between high-power laser mirrors designed for use in the visible and infrared wavelengths and synchrotron mirrors designed for use at x-ray wavelengths. The use of synchrotron mirrors at grazing incidence results in a relaxation of figure, surface microroughness, and thermal heating tolerances relative to the wavelength of nearly two orders of magnitude. As a result, the tolerances become roughly comparable to those desired for high-power laser mirrors for the visible region of the spectrum. Experience gained over the years by laser mirror designers in substrate design, the influence of metallic coatings on thermal and optical performance and limiting values for surface microroughness may be helpful to designers of synchrotron systems, but exploitation of the promise of the new synchrotron systems still represents a challenging problem for researchers. The specifications and operational approaches to meeting them for the new Advanced Photon Source at Argonne National Laboratory are given. DOE

The behavior of the contrast characteristics in IR images as a function of weather parameters was investigated in order to gain insight into the dependence of detectability of targets with IR sensors as a function of environmental parameters. IR images in the 10 micron band acquired with the DuDa sensor were used. The images consist of a series of 325 recordings of various objects situated in a natural background. For every pixel, the observed apparent temperatures are fitted as a function of the measured environmental parameters using the multilinear regression method. The derived empirical model can be used to simulate imagery for other sets of environmental parameters which have not been observed. ESA

Three methods of detecting the location of active targets using machine vision are described. In the field of visual servoing, the detection and location of targets is the first step in controlling the motion of a platform with respect to the target. In certain long-range outdoor settings, active targets are the only feasible target type. For each method (centroid, linear parameter estimation, and nonlinear parameter estimation), a theoretical resolution and accuracy analysis is performed. This analysis is followed by an experimental suite that determines real resolution and accuracy of each method. Results show that the linear parameter estimation technique does not properly locate active targets. Both the centroid and nonlinear parameter estimation techniques can achieve accuracies of 0.25 pixels in locating active targets. Author (CISTI)

The objective of this program was the development of novel OMCVD/LCVD processes for preparation of wide band-gap semiconductors and the elucidation of the basic reaction mechanisms in these processes, so as to control the deposition rates and to improve the opto-electronic properties of the materials. The synthesis and the mechanistic elucidation of wide band-gap III/V metal nitrides by OMCVD and LCVD, the dry-passivation of GaAs and the deposition of carbon nitride films, have been carried out with a unique UHV surface reaction system equipped with multiple gas-phase and surface species analyses. The system was constructed with joint support from the ONR and Emory University. Gas-phase species were detected by EI- and REMPI-MS, whereas surface species and structure were characterized by multiple surface diagnostic tools: AES, UPS, XPS, LEED, SEM and HREELS. The systematic elucidation of the spectroscopy and the mechanisms for the thermal and photochemical decomposition reactions of individual source molecules involved in the OMCVD/LCVD processes were first carried out before the actual deposition processes were conducted. We used a new nitrogen source, hydrazoic acid (HN3), for the preparation of InN films with 1:1 elemental ratio by low-pressure CVD. The prepared films were characterized by AES, UPS, XPS, SEM, LEED and HREELS, and optical techniques such as UV/visible adsorption and photo-luminescence. InN films with very high quality SEM and UPS characteristics have been deposited on GaAs substrates without a buffer layer. Over 20 technical papers (with 23 presentations) were completed from these studies. DTIC

The Optoelectronic Technology Consortium has been established to position U.S. industry as the world leader in optical interconnect technology by developing, fabricating, integrating and demonstrating the producibility of optoelectronic components for high-density/high-data-rate processors and accelerating the insertion of this technology into military and commercial applications. This objective will be accomplished by a program focused in three areas. Demonstrated performance: OETC will demonstrate an aggregate data transfer rate of 16 Gb/s between single transmitter and receiver packages, as well as the expandability of this technology by combining four links in parallel to achieve a 64 Gb/s link. Accelerated development: By collaborating during the precompetitive technology development stage, OETC will advance the development of optical components and produce links for a multiboard processor testbed demonstration. Producibility: OETC's technology will achieve this performance by using components that are affordable and reliable. DTIC

With traditional flare measurements, a flare is assumed to be a point source since it is a relatively small target viewed at a relatively long range. However, when the flare area becomes sufficiently large in relation to the viewing range, the flare must be treated as an extended source, and the spatial characteristics of the flare must be considered. The ability of an imaging radiometer to provide spatial information makes this instrument ideal for area type flare measurements. This report outlines a series of calibration and characterization procedures performed on the AGEMA 880+ thermal imager. The project objectives were to do the following: (1) Verify the accuracy of 880+ measurements; (2) Perform an external calibration of the 880+ system; and (3) Reduce radiometric data and produce false color images. A Mathematica software package to model the behavior of light inside an optical waveguide is discussed. Examples of package features are presented and discussed. Possible new waveguide materials are investigated with this package as a baseline for material evaluation. The use of the polymer 6F-PBO-IE as a possible candidate for high temperature optical waveguide material based in its high Tg of 300C and its optical clarity is discussed. Theoretical studies are performed with the Mathematica package. Slab waveguide samples are fabricated by spin-coating on oxidizO5 silicon wafers and characterized through measurements of the index of refraction and waveguide loss. Results show that the material exhibits its lowest loss of 4.5 db/cm at a wavelength of 700nm. We conclude, based on experimental results, that this material, 6F-PBO-1E, while it may be useful for some optical applications, does not meet the Air Force specification of 1 db/cm or less performance guideline for optical waveguide materials and therefore is not appropriate for Air Force applications in its present form. AN OPTOELECTRONIC GRAPHICS DISPLAY PROCESSOR Quarterly Report, 15 Sep. - 14 Dec. 1993
Vincent P. Heuring 15 Dec. 1993 4 p
(Contract N00014-93-1-0419)
(AD-A274401) Avail: CASI HC A01/MF A01

We are continuing to make significant progress toward an Optoelectronic Graphics Display Processor. During this period we have designed and are having fabricated, at no cost to ONR, some small prototype OEIC high-speed detector amplifiers and microlaser driver circuits. We are proceeding with our calculations of system bit error rate due to crosstalk and power loss, and we have redesigned our system visualization and animation CAD component. Most importantly, we are extending our architecture to handle 3D scenes, that is, incorporation of a Z-buffer, and we are also extending it to handle color/gray scale. DTIC

The objective of this research was to quantitatively evaluate the concept of time-domain optical memory (TDOM) using the hole-burning mechanism. The TDOM concept offers both high speed and high memory density. The advantage of TDOM over traditional semiconductor memory is its inherent parallelism, which allows data to be stored and retrieved from the memory at much higher speed. The practical success of the proposed memory, therefore, depends critically on-among other issues-the storage, retrieval, and processing of images. In addition, new data storage techniques are needed to implement a practical memory. The last three years of this research program focused on (1) development of new phase modulation techniques to enhance the storage, retrieval, and integrity of the stored information; (2) experimental studies of image storage and phase conjugate retrieval; (3) image processing; and (4) practical holographic storage of images by using the hybrid time-frequency approach. Specifically, SRI demonstrated data encryption by phase modulating the read and write pulses. Image correlation and convolution was demonstrated and its implication for pattern recognition examined. Finally, this laboratory demonstrated high-fidelity random access and retrieval using holographic storage in Pr3+: YA103 with a single-frequency ring laser. These experiments have clearly demonstrated the practical viability of TDOM with existing technology. In the next stage of the research, the performance issues such as bit-error-rates, signal-to-noise ratios, and laser stability need to be addressed. DTIC

This is the first in a series of five periodic reports concerning research and development within nonlinear optics at FOA3. Results are obtained in four distinct activity areas: (1) Development of techniques for determination of nonlinear index of refraction and two photon absorption. Equipment for z-scan measurements has been built and development of theory and computer programs for analysis has started. (2) Preparation and characterization of electrooptically active (liquid crystalline) polymer films. Equipment for m-line spectroscopy and associated analysis programs are developed at FOA2. (3) Theoretical calculations of nonlinear optical properties of organic materials. Several classes of organic materials (molecules) have been examined theoretically and from the results a series of test materials has been purchased. (4) Literature studies and seminars. A database for materials (organics) and applications/techniques of nonlinear optics has been created. NTIS

DETECTION OF LOW-INTENSITY MAGNETIC FIELDS WITH A MAGNETOSTRICTIVE FIBER OPTIC SENSOR M.S. Thesis
Laura L. Picon Dec. 1993 262 p
(AD-A274120; AFIT/GE/Eng/93D-32) Avail: CASI HC A12/MF A03

This thesis presents the fabrication, evaluation, and performance results of a magnetostrictive fiber optic sensor. The sensor was fabricated using a Mach-Zehnder interferometric arrangement. Four classes of sensing arms were fabricate as: ribbons, cylinders, sandwiches, and sputter coated sheaths. The four classes of sensing arms were evaluated using Metglas(TM), nickel, and a combination of Metglas(TM) and nickel. Optimization techniques were applied to the sensor to maximize its sensitivity. These techniques included: annealing the magnetostrictive material, operating the magnetic field at a range of frequencies, enclosing the sensor in a shielded chamber, and fabricating the sensing arms with polarization maintaining fiber optic cable. The lowest magnetic flux density that could be detected was 0.3 mG. This was achieved using a Metglas ribbon-fiber configuration with the ribbon's magnetization direction aligned perpendicularly with the applied 52 kHz AC magnetic field with a 5 volt DC bias. When operating this configuration at a 10 Hz AC magnetic field with a 5 volt DC bias, the lowest magnetic flux density that could be achieved was 8.9 mG. DTIC

ENHANCED TRACKING OF AIRBORNE TARGETS USING FORWARD LOOKING INFRARED AND LASER RETURN MEASUREMENTS M.S. Thesis
Patrick J. Grondin Dec. 1993 441 p
(AD-A274181; AFIT/GE/Eng/93D-11) Avail: CASI HC A19/MF A04

The Air Force Institute of Technology has been involved in developing Kalman filter based trackers of ballistic missiles for 15 years. The goal of this thesis is to develop a Multiple Model Adaptive Estimator (MMAE) that tracks the missile plume (using a forward looking infrared sensor) and the missile hardbody center-of-mass (using low energy laser returns) for the purpose of directing a high power laser to incapacitate the missile. The missile plume 'pogos' about an offset equilibrium point (relative to the hardbody center-of-mass) with an amplitude and frequency of oscillation that are not precisely known a priori. The MMAE algorithm estimates these parameters to improve performance in tracking the hardbody center-of-mass. To accomplish this MMAE structure, single Kalman filters were developed and tested at the different parameter values. A Kalman filter residual analysis was used on these working single filters to define the MMAE structure that provided the most effective adaptation and most

accurate target tracking. A three-filter MMAE structure gave the lowest hardbody center-of-mass tracking errors. The two-dimensional parameter space, pogo amplitude and frequency, was successfully partitioned according to the frequency of oscillation. When the plume pogo amplitude is large, the MMAE structure substantially reduces the tracking errors of the hardbody center-of-mass, compared to a tracker without adaptive pogo estimation.

METHOD OF MEASURING LIQUID LEVEL Patent Application
Lloyd Bobb, inventor (to Navy) 24 Nov. 1993 25 p
(AD-D016049; US-Patent-Appl-SN-159962) Avail: CASI HC A03/MF A01

A method of measuring the position of a liquid surface vessel is described. An optical fiber is provided which has first and second ends and has an energy-absorbing element of a predetermined length disposed upon a portion of the cladding thereof such that there is a thermal interface between the energy-absorbing element and the cladding. The optical fiber is then positioned in the vessel so that the energy-absorbing element disposed thereon extends a known distance into the vessel along a known depth gradient of the vessel and so that the energy-absorbing element will intersect the liquid surface over the anticipated range of positions. Single-frequency, coherent light is then transmitted through the core of the optical fiber by launching it into the first end of the optical fiber. A pulse of energy is applied across the entire length of the energy-absorbing element to heat it, and then the transmitted light is received from the second end of the optical fiber. The change in phase of the transmitted light resulting from applying the pulse of energy is then measured, and the position of the liquid surface is then determined in accordance with the change in phase. A study was made of the interaction between infrared radiation in an optical fiber and a specimen in which the fiber was embedded. The interaction involves the evanescent field which extends outside the fiber, and the present study concentrated on the absorption of this field by the specimen, which behaves as cladding on the fiber. A theoretical model of the absorption process was developed, which expresses the absorption by an infinite cladding in terms of fiber and sample parameters and radiation coupling conditions. Experimental checks showed that the model could predict the radiation absorption within a 5% error range. A second model was developed, to predict the signal to noise ratio as a function of fiber and sample parameters and radiation coupling conditions. The predictions of the model were confirmed experimentally and the model was used to develop a novel fiber-bundle sensor. This sensor combines a large energy-collecting capacity with high responsivity, so that the signal to noise ratio for weak signals can be improved five-fold compared with a single-fiber sensor. The model developed for absorption in a single-fiber sensor is valid also for the fiber-bundle sensor. Another novel sensor, developed and studied in the course of the present investigation, is the bitapered fiber sensor, which improves the signal to noise ratio for weak signals by up to two orders of magnitude, compared with a single-fiber sensor of the same interaction length. The model for absorption by an infinite cladding layer was extended for the case of thin cladding layers. An experiment characterizing the absorption spectrum of a thin layer is presented and the model is used to calculate its thickness (160 A). In the last part of the study, two unique experiments are presented, one being the measurement of a gas by a bitapered fiber sensor in an FTIR spectrometer and the other being the monitoring of the steps of a polymer layer growth by infrared spectroscopy. Ir-FIBERS IN A LASER THREAT WARNING SYSTEM AND ROBOT SHOT WARNING SYSTEM [IR-FIBRER I LASERVARNARE OCH ROBOTSKOTTVARNARE]
S. Oedman and J. P. Bengtsson Mar. 1993 36 p In SWAHILI
(PB94-124476; FOA-C-30697-9.4,3.1) Avail: Issuing Activity (National Technical Information Service (NTIS))

The report contains a literature survey of research on optical and mechanical properties and the aging of IR fibers. Many glasses and crystals have their lowest attenuation in the infrared, IR, region. The attenuation in these materials has a theoretical value, 10(exp -3) (dB/km), that is much lower than in optical quartz fibers, 0.15 (dB/km). IR fibers may therefore give better performance, economy and novel technical solutions for fiber optic sensors and communication systems. Transmission of IR radiation in laser warning systems and imaging IR systems is potentially possible using IR-fibers. A field of regard of 360 deg can be realized by transmitting IR radiation from various strategic points at a platform to a central detector or imaging system. There are, however, uncertainties about long term mechanical and optical properties. The authors have also calculated theoretical detection distances for laser threat and missile warning systems. A STUDY OF MULTIPLE GUIDE OPTICAL COUPLERS M.S. Thesis
Edward Milczarek Mar. 1993 153 p
(ISBN-0-315-84633-X; CTN-94-61082) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Coupled mode theory is introduced and used to study the transfer characteristics of multiple guide optical couplers. Two- and three-guide couplers are examined to determine their effectiveness as power transfer devices, and the implementation of two- and three-guide switches is discussed. An approach to designing a three-guide coupler is introduced, in which a feedback loop is placed around one of the guides. It is demonstrated that this device exhibits desirable characteristics unavailable in current passive coupler designs: splitting any fraction of a signal while maintaining a zero-phase shift between the outputs, as well as combining two signals of arbitrary amplitude and phase. The wavelength dependence of this device is examined, and its potential as a wavelength selective filter or wavelength division multiplexer is demonstrated. Various computer programs were developed to aid in the analysis of optical couplers, including one that animates the eigensolutions of the device as signals propagate through its length. The technique of eigensolution decomposition is used to illustrate the relationship between coupling parameters of multiple N-guide couplers such that they may either achieve complete transfer of power between guides or act as interferometers. ANALYTIC APPROXIMATION TO RANDOMLY ORIENTED SPHEROID EXTINCTION
B. T. N. Evans and G. R. Fournier Dec. 1993 50 p
(DREV-4712-93; DSIS-94-00102; CTN-94-61116) Avail: CASI HC A03/MF A01

The estimation of electromagnetic extinction through dust or other nonspherical atmospheric aerosols and hydrosols is an essential first step in the evaluation of the performance of all electro-optic systems. Investigations were conducted to reduce the computational burden in calculating the extinction from nonspherical particles. An analytic semi-empirical approximation to the extinction efficiency Q(sub ext) for randomly oriented spheroids, based on an extension of the anomalous diffraction formula, is given and compared with the extended boundary condition or T-matrix method. This will allow for better and more general modeling of obscurants. Using this formula, Q(sub ext) can be evaluated over 10,000 times faster than with previous methods. This approximation has been verified for complex refractive indices m=n-ik, where n ranges from one to infinity and k from zero to infinity, and aspect ratios of 0.2 to 5. It is believed that the approximation is uniformly valid over all size parameters and aspect ratios. It has the correct Rayleigh, refractive index, and large particle asymptotic behaviors. The accuracy and limitations of this formula are extensively discussed. Author (CISTI)

BINARY OPTICAL ELEMENTS: STUDIES IN DESIGN, MANUFACTURE AND PERFORMANCE M.S. Thesis
Norman Douglas Bell May 1990 196 p
(ISBN-0-315-60643-6; CTN-94-60985) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Binary optical elements made from computer generated holographic masks were designed and fabricated using e-beam and pattern generation mask writers and standard photoresist techniques. These 10.6 micrometer wavelength diffractive elements include F/6 and F/10, 50-mm diameter, cylindrical elements and a F/24, 12.4-mm diameter spherical element on thin Si substrates for use with a plane wave incident at 45 deg. A relatively simple hybrid mechanical binary reflective element was fabricated by deforming the straight ridges of the F/6 cylindrical element in the other direction to give spherical focusing. The Si wafer was pressure mounted onto an Al base, milled to yield an elliptically curved surface requiring maximum wafer deflections of 0.79-0.83 mm across the aperture. All elements were tested, utilizing computer controlled data acquisition, for relative focusing abilities by scanning a detector, apodized with a 15 micrometer pinhole, over the focal region. The F/10 cylindrical element blur width dimension was 279 micrometers and the F/24 spherical element gave blur spot dimensions of 483 by 635 micrometers, both within 10 percent of their predicted values. The F/6 hybrid element yielded an unsymmetrical blur spot 254 by 343 micrometers, compared to its ideal value of 155 by 155 micrometers. These deviations are discussed. Author (CISTI)

DEVELOPMENT OF A 2f OPTICAL PERFORMANCE MEASUREMENT SYSTEM
J. W. Grossman 1993 8 p Presented at the ASME International Solar Energy Conference, San Francisco, CA, 27-30 Mar. 1994
(Contract DE-AC04-94AL-85000)
(DE94-003489; SAND-93-1533C; CONF-940326-2) Avail: CASI HC A02/MF A01

Commercialization of faceted stretched-membrane concentrators has created the need for quality control measurements for facet optical performance. High-volume production scenarios require a test method that is quick, can be performed on the production floor, and does not require laboratory-grade equipment. At Sandia, we are developing an optical test method that can be done in a relatively short period of time, requires little space, uses 'off the shelf' test equipment, and provides a quantitative measure adequate to address quality control requirements. The test method is based on common ray trace calculations for targets and images at the radius of curvature for spherical and parabolic (f/D greater than 3) concentrators. The initial development work was done using a monochrome television camera and the beam characterization system. Twenty-four 3-meter facets built for a faceted stretched-membrane dish were characterized using this system. Other smaller facets have also been tested with the system to help establish a correlation with this method and other optical characterization tests. Current work involves adapting a color camera to the system and developing custom software to reduce analysis time and make the system viable for the production floor. This paper discusses the development of the monochrome system, reviews the results of testing, and presents plans for the development of a color system. DOE

THE OPTICAL PROPERTIES OF HIGH-T(c) SUPERCONDUCTORS GROWN BY PULSED LASER DEPOSITION Ph.D. Thesis
Robert Alan Hughes Sep. 1992 152 p
(ISBN-0-315-84917-7; CTN-94-61108) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Superconducting Pb-Cu-Sr-Y-Ca-O films were successfully grown in-situ by pulsed laser deposition on LaAlO3 at 620 C. The growth procedure yields relatively sharp superconducting transitions and by substituting Ca for Y it is possible to vary the superconducting transition temperature from 10 K to a maximum of 86 K. The laser deposition system was also used to deposit superconducting Nd-Ce-CuO thin films. By carefully controlling the film's oxygen content through high temperature vacuum anneals, it is possible to obtain a superconductor with a transition temperature onsetting at 21 K. The far infrared optical properties of these films were measured using Michelson interferometry. The optical conductivity obtained from Kramers-Kronig analysis is divided into two components, the first fitted to a Drude model and the second described by a model which couples phonons to a midinfrared band. The far infrared reflectance of partially transparent Pb-Cu-Sr-Y-Ca-O films was measured, and normal state results were also described in terms of the two component model. The Drude component again showed a constant plasma frequency and a scattering rate which closely follows the temperature dependence of the direct current resistivity, while the second component showed only a small change as the temperature was varied. OPTICAL PARAMETRIC OSCILLATOR MODELING WITH DIFFRACTION, DEPLETION, AND DOUBLE REFRACTION
M. S. Bowers (Aculight Corp., Bellevue, WA.) and A. V. Smith 1993 4 p Presented at the 9th Advanced Solid-State Lasers Meeting, Salt Lake City, UT, 7-10 Feb. 1994
(Contract DE-AC04-94AL-85000)
(DE94-001504; SAND-93-2226C; CONF-940226-1) Avail: CASI HC A01/MF A01 (US Sales Only)

Advancement in the growth and fabrication of nonlinear materials along with continual improvements in the performance of solid-state lasers have led to a resurgence of interest in the development of optical parametric oscillators (OPO's). While many experimental results have been recently reported, very little attention has been given to the development of detailed models to simulate the output characteristics (such as beam quality, efficiency, and threshold) of nanosecond-pumped OPO's. Such models are necessary for understanding experiments and for developing advanced OPO designs that enhance the overall performance of these devices. In this work, we describe a time-dependent model of pulsed OPO's that includes diffraction, depletion, and double refraction (walkoff) in the parametric amplification process. The model is used to predict output beam profiles, beam quality, and conversion efficiency of an injection-seeded KTP ring OPO. Predicted output beam profiles in the near and intermediate fields are in qualitative agreement with the experimental results reports in a companion paper. Our results show that diffraction and double refraction must be included in models of pulsed OPO's to predict realistic beam profiles. DOE

A number of applications would benefit from sources of tunable coherent ultraviolet (uv) radiation in the 250 to 400 nm range. Among these are uv fluorescence laser detection and ranging (LIDAR). Other applications such as photolithography could use a fixed-frequency solid-state equivalent to excimer lasers. Broad tunability in this wavelength region has generally been accessed by frequency doubling tunable visible or near infrared lasers or by frequency mixing these lasers with the harmonics of a Nd:YAG laser. Unfortunately, to cover the full wavelength range requires multiple dye changes and/or multiple nonlinear crystals because of the relatively narrow tuning range of any one laser medium. The use of optical parametric oscillators (OPO's) with their wide tuning range as a tunable source of near infrared light coupled with a single (beta)-barium borate (BBO) crystal for sum frequency mixing with the Nd:YAG harmonics should yield a convenient alternative to cover this wavelength range. In this paper we demonstrate that an OPO can be efficiently sum frequency mixed with the Nd:YAG harmonics to produce tunable uv radiation in the 250-400 nm range. This is significant because OPO's generally have poor beam quality which limits their nonlinear conversion in critically phase matched processes. Specifically, we have mixed the 780 nm signal beam from a potassium tytanyl phosphate (KTP) OPO with the second harmonic from a Nd:YAG laser in BBO converting up to 50% of the OPO photons into 316 nm photons. We have also demonstrated the generation of narrow bandwidth 248 nm by mixing 827 nm from the OPO with the third harmonic of the Nd:YAG. DOE

THE PROTEL CONTAMINATION CODE Report No. 4
C. A. Hein 31 Jul. 1993 31 p
(Contract F19628-90-C-0090)
(RXR-93071; PL-TR-93-2178) Avail: CASI HC A03/MF A01

The Proton Telescope (PROTEL) was one of several instruments used to measure the proton populations encountered by the Combined Radiation and Release Experimental Satellite (CRRES) in its 15 months of successful operation. In the radiation environment encountered by CRRES, the PROTEL instrument was subjected to contamination caused by the penetration of high energy protons passing through the instrument outside its nominal aperture, falsely trigger a valid detection response. The PROTEL contamiation code was written to model the performance of the PROTEL High Energy Head (HEH) which is designed to respond to protons in the 10-100 MeV range. This report provides a brief description of the contamination code, the methodology underlying the modeling used, together with a summary of results. Tables and graphs describing the PROTEL contamination response for isotropic and mirror plane proton distributions are provided. The results of the modeling have been successfully used to compare PROTEL observations with observations made by the CRRES radiation dosimeter and proton instruments aboard other satellites. OPTICAL PATTERN RECOGNITION SYSTEM UTILIZING RESONATOR ARRAY Patent
Joseph P. Garcia, inventor (to Navy) 31 Aug. 1993 20 p Filed 31 Aug. 1992
(AD-D016071; US-Patent-5,241,616; US-Patent-Appl-SN-937098; US-Patent-Class-385-126) Avail: US Patent and Trademark Office

Separate features of a composite image in a field of view illuminated by a laser beam are respectively monitored by low level optical cavity resonators of an array from which optical data outputs are distributed to high level resonators for optical data correlation. Adjacent low level resonators of the array are coupled by controllers for modal interaction modified by feedback to the controllers from the high level resonators through optical signal transforming means for signal correction purposes in pattern recognition of the composite image. TOROIDAL PLASMA BETA-FLR LIMIT IN A TOROIDALLY LINKED MIRROR SYSTEM
H. V. Wong, H. L. Berk, V. I. Ilgisonis, and V. P. Pastukhov Oct. 1993 27 p
(Contract DE-FG05-80ET-53088)
(DE94-003119; DOE/ET-53088/627; IFSR-627) Avail: CASI HC A03/MF A01

The ballooning stability limit in one toroidal section of the recently proposed toroidally linked neutron source is investigated in the context of finite Larmor radius effects. The ideal ballooning instability limits the toroidal plasma beta to less than 1% for a reasonable set of design parameters. The inclusion of stabilizing kinetic effects predicts an improvement in the toroidal plasma beta limit to approximately 2 percent. DOE

REVIEW OF TOKAMAK EXPERIMENTS ON DIRECT ELECTRON HEATING AND CURRENT DRIVE WITH FAST WAVES
R. I. Pinsker Dec. 1993 13 p Presented at the 10th Topical Conference on Radio Frequency Power in Plasmas, Boston, MA, 1-3 Apr. 1993
(Contract DE-AC03-89ER-51114)
(DE94-004185; GA-A-21286; CONF-9304112-24) Avail: CASI HC A03/MF A01

Results from tokamak experiments on direct electron interaction with the compressional Alfven wave (fast wave) are reviewed. Experiments aimed at electron heating as well as those in which fast wave electron current drive was investigated are discussed. A distinction is drawn between experiments employing the lower hybrid range of frequencies, where both the lower hybrid wave (slow wave) and the fast wave can propagate in much of the plasma, and those experiments using the fast wave in the range of moderate to high ion cyclotron harmonics, where only the fast wave can penetrate to the plasma core. Most of the early tokamak experiments were in the lower hybrid frequency regime, and the observed electron interaction appeared to be very similar to that obtained with the slow wave at the same frequency. In particular, electron interaction with the fast wave was observed only below a density limit nearly the same as the well known slow wave density limit. In the more recent lower frequency fast wave experiments, electron interaction (heating and current drive) is observed at the center of the discharge, where slow waves are not present. DOE

HEAVY NEUTRAL BEAM PROBE FOR EDGE PLASMA ANALYSIS IN TOKAMAKS
J. Castracane, E. Saravia, J. Beckstead, and S. Aceto 3 Sep. 1993 19 p
(Contract DE-FG02-91ER-54111)
(DE94-003391; DOE/ER-54111/3) Avail: CASI HC A03/MF A01

The contents of this report present the progress achieved to date on the Heavy Neutral Beam Probe project. This effort is an international collaboration in magnetic confinement fusion energy research sponsored by the US Department of Energy, Office of Energy Research (Confinement Systems Division) and the Centre Canadien de Fusion Magnetique (CCFM). The overall objective of the effort is to develop and apply a neutral particle beam to the study of edge plasma dynamics in discharges on the Tokamak de Varennes (TdeV) facility in Montreal, Canada. To achieve this goal, a research and development project was established to produce the necessary hardware to make such measurements and meet the scheduling requirements of the program. At present the project is in the middle of its second budget period with the instrumentation on-site at TdeV. The first half of this budget period was used to complete total system tests at InterScience, Inc., dismantle and ship the hardware to TdeV, and reassemble and install the HNBP on the tokamak. Integration of the diagnostic into the TdeV facility has progressed to the point of first beam production and measurement on the plasma. At this time, the HNBP system is undergoing final debugging prior to restart of machine operation in early Fall of this year. DOE

KINETIC RESONANCE DAMPING RATE OF THE TOROIDAL ION TEMPERATURE GRADIENT MODE
J. Y. Kim, Y. Kishimoto, W. Horton, and T. Tajima Nov. 1993 36 p Revised
(Contract DE-FG05-80ET-53088)
(DE94-003511; DOE/ET-53088/623; IFSR-623) Avail: CASI HC A03/MF A01

The linear damping rates of the toroidal ion temperature gradient ((eta)(sub i)) mode due to the toroidal resonance are calculated in the local kinetic limit. The well-known Landau contour method is generalized to treat the analytic continuation problem of the guiding center dispersion function in the toroidal resonance system where the resonance occurs from both the magnetic (del)B-curvature drift and the parallel ion transit drift. A detailed numerical analysis is presented for the dependence of the damping rate of the toroidal (eta)(sub i) mode on various parameters such as (epsilon)(sub n), (kappa)(sub y), and the rapped electron fraction. In addition, a consideration is presented on the decay problem of the ballistic response by phase mixing in the toroidal system, which is directly related to the kinetic damping problem of the wave normal modes by the toroidal resonance. RF MODELING AND DESIGN OF A FOLDED WAVEGUIDE LAUNCHER FOR THE ALCATOR C-MOD TOKAMAK
T. S. Bigelow, C. F. Fogelman, F. W. Baity, M. D. Carter, D. J. Hoffman, P. M. Ryan, J. J. Yugo, S. N. Golovato (Massachusetts Inst. of Tech., Cambridge.), and P. Bonoli (Massachusetts Inst. of Tech., Cambridge.) 1993 5 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC05-84OR-21400)
(DE94-003588; CONF-931018-64) Avail: CASI HC A01/MF A01

The folded waveguide (FWG) launcher is being investigated as an improved antenna configuration for plasma heating in the ion cyclotron range of frequencies (ICRF). A development FWG launcher was successfully tested at Oak Ridge National Laboratory (ORNL) with a low-density plasma load and found to have significantly greater power density capability than current strap-type antennas operating in similar plasmas. To further test the concept on a high density tokamak plasma, a collaboration has been set up between ORNL and Massachusetts Institute of Technology (MIT) to develop and test an 80-MHz, 2-MW FWG on the Alcator C-Mod tokamak at MIT. The radio frequency (rf) electromagnetic modeling techniques and laboratory measurements used in the design of this antenna are described in this paper. A companion paper describes the mechanical design of the FWG. DOE

INTERACTION BETWEEN A HIGH DENSITY-LOW TEMPERATURE PLASMA AND A FROZEN HYDROGEN PELLET IN A RAILGUN INJECTOR Ph.D. Thesis
Michael James Grapperhaus (Illinois Univ., Urbana.) 1993 82 p
(Contract DE-AC05-76OR-00033)
(DE94-000846; DOE/OR-00033/T552) Avail: CASI HC A05/MF A01

A model has been developed which describes the ablation process of frozen hydrogen pellets in an electromagnetic railgun. The model incorporates the neutral gas shielding model in which the pellet surface is heated by incident electrons from the plasma arc. The heated surface then ablates, forming a neutral cloud which attenuates the incoming electrons. The energy lost in the cloud by the electrons heats the ablatant material as it flows into the plasma arc. Under steady-state conditions, a scaling law for the ablation rate was derived as a function of plasma-arc temperature and density. In addition, flow conditions and the criteria for the existence of a steady-state solution were formulated and subsequently examined under simplifying assumptions. Comparison with experimentally observed ablation rates shows good qualitative agreement. DOE

NONLINEAR GROWTH OF STRONGLY UNSTABLE TEARING MODES
F. L. Waelbroeck Nov. 1993 29 p
(Contract DE-FG05-80ET-53088)
(DE94-003366; IFSR-633; DOE/ET-53088/633) Avail: CASI HC A03/MF A01

Rutherford's theory of the tearing instability is extended to cases where current nonlinearities are important, such as long wavelength modes in current slabs and the m = 1 instability in tokamaks with moderately large aspect ratios. Of particular interest is the possibility that the associated magnetic islands, as a result of secondary instabilities, have a singular response to the ohmic diffusion of the current. A family of islands is used to test this possibility; it is found that the response remains bounded. DOE

EVALUATION OF HELIUM COOLING FOR FUSION DIVERTORS
C. B. Baxi Sep. 1993 12 p Presented at the International Atomic Energy Agency (IAEA) Meeting on Fusion Studies, Los Angeles, CA, 13-17 Sep. 1993
(Contract DE-AC03-89ER-51114)
(DE94-002680; GA-A-21448; CONF-9309274-1) Avail: CASI HC A03/MF A01

The divertors of future fusion reactors will have a power throughput of several hundred MW. The peak heat flux on the diverter surface is estimated to be 5 to 15 MW/sq m at an average heat flux of 2 MW/sq m. The divertors have a requirement of both minimum temperature (100 C) and maximum temperature. The minimum temperature is dictated by the requirement to reduce the absorption of plasma, and the maximum temperature is determined by the thermo-mechanical properties of the plasma facing materials. Coolants that have been considered for fusion reactors are water, liquid metals, and helium. Helium cooling has been shown to be very attractive from safety and other considerations. Helium is chemically and neutronically inert and is suitable for power conversion. The challenges associated with helium cooling are as follows: (1) manifold sizes; (2) pumping power; and (3) leak prevention. In this paper the first two of the above design issues are addressed. A variety of heat transfer enhancement techniques are considered to demonstrate that the manifold sizes and the pumping power can be reduced to acceptable levels. A helium-cooled diverter module was designed and fabricated by GA for steady-state heat flux of 10 MW/sq m. This module was recently tested at Sandia National Laboratories. At an inlet pressure of 4 MPa, the module was tested at a steady-state heat flux of 10 MW/sq m. The pumping power required was less than 1% of the power removed. These results verified the design prediction. DOE

HOOK SPECTROSCOPY AS AN ATOMIC NUMBER DENSITY DIAGNOSTIC APPLIED TO LASER-ABLATED COPPER PLASMAS
D. K. Zerkle, A. D. Sappey, and T. K. Gamble 1993 13 p Presented at the Fall Meeting of the Western States Section of the Combustion Institute, Menlo Park, CA, 18-19 Oct. 1993
(Contract W-7405-eng-36)
(DE94-002645; LA-UR-93-3624; CONF-931076-2) Avail: CASI HC A03/MF A01

Hook spectroscopy has been used to determine the absolute number density of ground state copper atoms in laser-ablated plasma plumes. An ablation laser power flux of approximately 1.5 GW/cm(exp 2) is applied to a solid copper target in a background gas, producing a plasma plume suitable for studying homogeneous copper vapor condensation. Density is measured at post-ablation time delays ranging from 10 to 3 microseconds with 25 torr of argon as the background gas. Planar laser-induced fluorescence (PLEF) images containing relative density information are used in conjunction with the hook spectra to resolve spatially the absolute density within the plume. Copper atom densities thus measured ranged from 1.9 x 10(exp 15) cm(exp -3) at a delay of 10 microseconds to 2.7 x 10(exp 13) cm(exp -3) at 3 microsecond delay in 25 torr of argon. The decrease in density is due to the condensation of copper vapor to form fine particulate. As a combustion diagnostic, the hook method may prove extremely useful for the determination of metal impurity density in coal fired flames as well as a single-shot OH density and temperature diagnostic. DOE

MEASUREMENT OF MAGNETIC FLUCTUATION INDUCED ENERGY TRANSPORT
G. Fiksel, S. C. Prager, W. Shen, and M. Stoneking Nov. 1993 16 p
(Contract DE-FG02-85ER-53198)
(DE94-003846; DOE/ER-53198/227) Avail: CASI HC A03/MF A01

The local electron energy flux produced by magnetic fluctuations has been measured directly in the MST reversed field pinch (over the radial range r/a greater than 0.75). The flux, produced by electrons traveling parallel to a fluctuating magnetic field, is obtained from correlation between the fluctuations in the parallel heat flux and the radial magnetic field. The fluctuation induced flux is large (100 kW/sq cm) in the 'core' (r/a less than 0.85) and small (less than 10-30 kW/sq cm) in the edge. DOE

N94-26140# Oak Ridge National Lab., TN.
HIGH-SPEED REPETITIVE PELLET INJECTOR FOR PLASMA FUELING OF MAGNETIC CONFINEMENT FUSION DEVICES
S. K. Combs, L. R. Baylor, and C. R. Foust et al 1993 9 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC05-84OR-21400)
(DE94-002792; CONF-931018-48) Avail: CASI HC A02/MF A01

The projected fueling requirements of future magnetic confinement devices for controlled thermonuclear research (e.g., the International Thermonuclear Experimental Reactor (ITER)) indicate that a flexible plasma fueling capability is required. This includes a mix of traditional gas puffing and low- and high-velocity deuterium-tritium pellets. Conventional pellet injectors (based on light gas guns or centrifugal accelerators) can reliably provide frozen hydrogen pellets (1- to 6-mm-diam sizes tested) up to approximately 1.3-km/s velocity at the appropriate pellet fueling rates (1 to 10 Hz or greater). For long-pulse operation in a higher velocity regime (greater than 2 km/s), an experiment in collaboration between Oak Ridge National Laboratory (ORNL) and ENEA Frascati is under way. This activity will be carried out in the framework of a collaborative agreement between the U.S. Department of Energy and European Atomic Energy Community--ENEA Association. In this experiment, an existing ORNL hydrogen extruder (equipped with a pellet chambering mechanism/gun barrel assembly) and a Frascati two-stage light gas gun driver have been combined on a test facility at ORNL. Initial testing has been carried out with single deuterium pellets accelerated up to 2.05 km/s with the two-stage driver; in addition, some preliminary repetitive testing (to commission the diagnostics) was performed at reduced speeds, including sequences at 0.5 to 1 Hz and 10 to 30 pellets. The primary objective of this study is to demonstrate repetitive operation (up to approximately 1 Hz) with speeds in the 2- to 3-km/s range. In addition, the strength of extruded hydrogen ice as opposed to that produced in situ by direct condensation in pipe guns can be investigated. The equipment and initial experimental results are described. DOE

DEVELOPMENT OF FUSION TECHNOLOGY
Churl Kew Hwang, Kwang Won Lee, Sang Ryul In, Soon Mo Hwang, Byung Hoon Oh, Seung Ho Jeong, Byeong Joo Youn, Jae Sung Yoon, and Woo Sup Song Jun. 1992 172 p In KOREAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-633444; KAERI/RR-1122/92) Avail: CASI HC A08 (US Sales Only)

Total inspections over the most components of KAERIT are made with respect to every details including vacuum, mechanical, and electrical ones during the period of reassembling of main body to reinforce the mechanical strength of toroidal field coils. The manufacturing of power supplies for the magnetic field coils is completed as their control system constructions and electrical connections to the main body of the tokamak have been finished this year. Power supply systems for the toroidal field coils, the ohmic heating transformer, and equilibrium field coils are connected to each coil assembly, and the basic circuit characteristics are tested individually. A study on the vacuum technology has been conducted to develop a vacuum regulating system and to establish the KAERIT vacuum cycles. The vacuum vessel is cleaned and examined thoroughly during the period of tokamak disassembling. Also, the remote control systems for vacuum regulation and gas injection have been composed and experiments on their system characteristics are conducted. To initiate the developments of data acquisition system and plasma diagnostics, active integrators are developed and a receiver system for electron cyclotron emission is designed as a first step. DOE

NEW THOMSON SCATTERING LASER CONTROL FOR D3-D
C. C. Makariou, R. E. Stockdale, T. N. Carlstrom, C. L. Hsieh, and G. Bramson Oct. 1993 4 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC03-89ER-51114)
(DE94-002890; GA-A-21427; CONF-931018-45) Avail: CASI HC A01/MF A01

A Laser Control system has been built for the D3-D Scattering Diagnostic. This new system has provided the capability to place the laser probe pulses with one microsecond timing precision throughout the D3-D shot. The new system fires the eight lasers with a programmable sequence which repeats ever 50 ms. If one wants to probe the plasma at a higher rate to study a fast paced event, the new control circuit can fire all charged lasers in rapid succession (BURST MODE). This burst rate is programmable. The new Laser Control system successfully replaced the previous control scheme which consisted of three VME Motorola 68030 computers (one host under UNIX VME V/68 and two interrupt driven targets under VME Exec. The old system was not successful due to the many VME interrupts needed to service the lasers. The new hardware approach is much more reliable. The old system still controls data acquisition and as a monitoring system since it does not have the burden of controlling the lasers. A brief description of the Thomson Scattering diagnostic will be presented with emphasis in the new upgraded laser firing control system and data acquisition timing control. DOE

N94-26321# Los Alamos National Lab., NM.
SCALING OF SUSTAINED ZT-40 M REVERSED FIELD PINCHES
J. Graham, ed. Dec. 1993 61 p
(Contract W-7405-eng-36)
(DE94-003318; LA-12567-MS) Avail: CASI HC A04/MF A01

Experiments aimed at evaluating the scaling properties of the ZT-40M Reversed-Field Pinch (RFP) facility were conducted in 1983 at Los Alamos. Sustained discharges were produced at nominal toroidal currents ranging from 60 to 240 kA. The standard fill pressure was kept close to the lower limit of the usable pressure range, and the scaling data were acquired at a fixed time in the discharges while the plasma was in a quasi-steady state. Scalings of the diameter-averaged electron density, electron temperature on axis, product of these two parameters, and of various definitions of the electrical resistivity are presented. Trends of the toroidal voltage, energy containment time, and poloidal beta are shown. The impurity contents, particle containment time, and total radiation losses are described, and results obtained with and without poloidal limiters are compared. In addition, the performance of the facility at higher than standard density and at a constant ratio of the toroidal current over the electron line density is examined. DOE

A ROBUST HELIUM-COOLED SHIELD/BLANKET DESIGN FOR ITER
C. P. C. Wong, R. F. Bourque, C. B. Baxi, A. P. Colleraine, H. J. Grunloh, T. Letchenberg, J. A. Leuer, E. E. Reis, K. Redler, and R. Will et al Nov. 1993 4 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC03-89ER-51114)
(DE94-003402; GA-A-21485; CONF-931018-61) Avail: CASI HC A01/MF A01

General Atomics Fusion and Reactor Groups have completed a helium-cooled, conceptual shield/blanket design for ITER. The configuration selected is a pressurized tubes design embedded in radially oriented plates. This plate can be made from ferritic steel or from V-alloy. Helium leakage to the plasma chamber is eliminated by conservative, redundant design and proper quality control and inspection programs. High helium pressure at 18 MPa is used to reduce pressure drop and enhance heat transfer. This high gas pressure is believed practical when confined in small diameter tubes. Ample industrial experience exists for safe high gas pressure operations. Inboard shield design is highlighted in this study since the allowable void fraction is more limited. Lithium is used as the thermal contacting medium and for tritium breeding; its safety concerns are minimized by a modular, low inventory design that requires no circulation of the liquid metal for the purpose of heat removal. This design is robust, conservative, reliable, and meets all design goals and requirements. It can also be built with present-day technology. DOE

LIMITATIONS OF POWER CONVERSION SYSTEMS UNDER TRANSIENT LOADS AND IMPACT ON THE PULSED TOKAMAK POWER REACTOR
G. T. Sager, C. P. C. Wong, D. D. Kapich, C. F. McDonald, and R. W. Schleicher Nov. 1993 4 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC03-89ER-52153)
(DE94-003404; GA-A-21474; CONF-931018-60) Avail: CASI HC A01/MF A01

The impact of cyclic loading of the power conversion system of a helium-cooled, pulsed tokamak power plant is assessed. Design limits of key components of heat transport systems employing Rankine and Brayton thermodynamic cycles are quantified based on experience in gas-cooled fission reactor design and operation. Cyclic loads due to pulsed tokamak operation are estimated. Expected performance of the steam generator is shown to be incompatible with pulsed tokamak operation without load leveling thermal energy storage. The close cycle gas turbine is evaluated qualitatively based on performance of existing industrial and aeroderivative gas turbines. Advances in key technologies which significantly improve prospects for operation with tokamak fusion plants are reviewed. DOE

FUSION ENERGY ADVISORY COMMITTEE: ADVICE AND RECOMMENDATIONS TO THE US DEPARTMENT OF ENERGY IN RESPONSE TO THE CHARGE LETTER OF SEPTEMBER 1, 1992
Apr. 1993 125 p
(DE93-019842; DOE/ER-0593T; FEAC-93-I) Avail: CASI HC A06/MF A02

This document is a compilation of the written records that relate to the Fusion Energy Advisory Committee's deliberations with regard to the Letter of Charge received from the Director of Energy Research, dated 1 Sep. 1992. During its sixth meeting, held in Mar. 1993, the FEAC provided a detailed response to the charge contained in the letter of 1 Sep. 1992. In particular, it responded to the paragraph: I would like the Fusion Energy Advisory Committee (FEAC) to evaluate the Neutron Interactive Materials Program of the Office of Fusion Energy (OFE). Materials are required that will satisfy the service requirements of components in both inertial and magnetic fusion reactors including the performance, safety, economic, environmental, and recycle/waste management requirements. Given budget constraints, is our program optimized to achieve these goals for DEMO, as well as to support the near-term ITER program? Before FEAC could generate its response to the charge in the form of a letter report, one member, Dr. Parker, expressed severe concerns over one of the conclusions that the committee had reached during the meeting. It proved necessary to resolve the issue in public debate, and the matter was reviewed by FEAC for a second time, during its seventh meeting, held in mid-Apr. 1993. In order to help it to respond to this charge in a timely manner, FEAC established a working group, designated Panel No. 6, which reviewed the depth and breadth of the US materials program, and its interactions and collaborations with international programs. The panel prepared background material, included in this report as Appendix 1, to help FEAC in its deliberations. DOE

NUMERICAL SIMULATION OF PLASMA VERTICAL POSITION STABILIZATION IN ITER [CHISLENNOE MODELIROVANIE STABILIZATSII VERTIKAL'NOGO POLOZHENIYA PLAZMY V ITEHR]
A. M. Astapkovich and S. N. Sadakov 1992 21 p In RUSSIAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634586; NIIEFA-P-B-0900) Avail: CASI HC A03 (US Sales Only)

Numerical simulation of plasma vertical position stabilization in ITER is addressed. The calculations are performed using EDDY C-2 code by the method of direct numerical simulation of transient electromagnetic processes taking into account the evolution of plasma position, cross-section shape and full plasma current. When simulating free vertical plasma drift in ITER with twin passive stabilization loops, it was shown that account of the effects of cross-section deformation and plasma current alternations results in almost two fold degradation of passive stabilization parameters as compared to the calculations for 'rigid displacement' model. In terms of methodology, the account of the effects of cross section deformation and plasma current alternations requires clarification of the definitions for reverse increment of vertical instability and for stability margin coefficient. The simulation of plasma pinch return to equilibrium position after the closure of control coils allows to assess the required parameters of active control system and demonstrate the effect of screen current reverse in twin loops. The obtained results were used to develop the ITER conceptual design and affected the choice of the concept of twin passive loops and new positron of control coils as the basis approaches. DOE

MARYLAND CONTROLLED FUSION RESEARCH PROGRAM
T. M. Antonsen, Jr., J. F. Drake, J. M. Finn, P. Guzdar, A. Hassam, C. S. Liu, and E. Ott May 1993 16 p
(Contract DE-FG02-93ER-54197)
(DE94-003533; DOE/ER-54197/1) Avail: CASI HC A03/MF A01

In recent years, members of the Maryland Plasma Theory Group have made significant contributions to the national fusion theory program, and, in many cases, these theoretical developments helped to interpret experimental results and to design new experimental programs. The technical progress in four major areas of tokamak research are summarized: (1) L/H transition and edge turbulence and transport; (2) active control of micro-turbulence and transport; (3) major disruptions; and (4) the sawtooth crash. PROBABILITY OF ACCESSING THE MULTIPLE SATURATED STATES IN THE RESISTIVE INTERCHANGE INSTABILITY
L. Garcia (Universidad Complutense, Madrid, Spain.), B. A. Carreras, and V. E. Lynch 1993 4 p Presented at the 20th European Conference on Controlled Fusion and Plasma Physics, Lisbon, Portugal, 26-30 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE94-000478; CONF-930720-21) Avail: CASI HC A01/MF A01

The probability of accessing the multiple saturated states for the full 3/2 helicity was studied. The presence of an external flow can induce Kelvin-Helmholtz type instabilities for relatively low beta values. This seems to be the case for the low-m modes with the equilibrium parameters used in our calculations. To separate this effect, a simplified electrostatic model in the numerical calculations was employed. DOE

CRITICAL SURVEY OF PLASMA PROCESSING Final Report
William P. Marable 28 Sep. 1993 9 p
(Contract MDA972-91-J-1006)
(AD-A274233) Avail: CASI HC A02/MF A01

Low temperature plasmas represent an expansive region in the density-temperature parameter space of experimentally generated plasmas. With densities ranging from 10(exp 6) to 10(exp 17) cu cm, and temperatures ranging from 10(exp -2) to 10 eV, these plasmas exhibit a variety of collective behaviors, supporting many physical states and interactions among the particle species within the plasma. It is precisely this variety in physical conditions that lends the plasma environment so well to the myriad of applications that have developed in plasma processing. Examples of these applications are: processing of solid state materials by ion implantation, thin film deposition, plasma enhanced chemical vapor deposition, plasma etching, and hardening and improving wear and corrosion resistance of refractory metals and composites. These applications have enjoyed great advancement in technological development. DTIC

CONCEPTUAL DESIGN OF THE TOKAMAK RADIATION SHIELDING FOR THE TOKAMAK PHYSICS EXPERIMENT (TPX)
M. J. Cole, B. E. Nelson, G. H. Jones, P. L. Goranson, Y. Gohar (Argonne National Lab., IL.), and S. L. Liew (Princeton Univ., NJ.) 1993 5 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC05-84OR-21400)
(DE94-002791; CONF-931018-52) Avail: CASI HC A01/MF A01

The tokamak radiation shielding includes the neutron and gamma shielding around the torus and penetrations required to (1) limit activation of components outside the shield to levels that permit hands-on maintenance, and (2) limit the nuclear heating of the superconducting coils and cold structure. The primary design drivers are space, the 350 C bakeout temperature, and cost; therefore, different shield materials were used for different shield components and locations. The shielding is divided into three areas: (1) torus shielding around the vacuum vessel, (2) duct shielding around the vacuum pumping ducts and vertical diagnostic ducts, and (3) penetration shielding in and around the radial ports. The major shield components include water between the walls of the vacuum vessel, lead monosilicate/boron carbide tiles that are attached to the exterior of the vacuum vessel, shield plugs that fill the openings of the large radial ports, and polyethylene/lead/boron shield blocks for duct shielding. A description of the shielding configuration and the performance and operational requirements are discussed. DOE

POTENTIAL OF COMMERCIAL TOKAMAK REACTORS WITH IMPROVED PHYSICS
J. D. Galambos, L. J. Perkins (Lawrence Livermore National Lab., CA.), S. Haney (Lawrence Livermore National Lab., CA.), and J. Mandrekas (Georgia Inst. of Tech., Atlanta.) 1993 4 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC05-84OR-21400)
(DE94-002794; CONF-931018-51) Avail: CASI HC A01/MF A01

The impact of improvements in plasma confinement and beta on commercial tokamak embodiments was systematically investigated. Cases were investigated for both steady-state and pulsed reactors. A narrow range of useful confinement enhancement (H factors over the ITER-89 Power scaling) and Troyon beta limit coefficients g are found to be beneficial for reducing the cost of electricity (COE). Improvements in the beta limit (i.e., g) offer the greatest improvement in reactors. For g limited to about

4, H factors of only 2 are needed. If g of 6 is attainable, H factors up to 2.5 are useful. Pulsed reactors have slightly higher useful H factors, ranging from 2.5 for g near 4 to 3 for g near 6. DOE

METHODOLOGY FOR FIRST WALL DESIGN
J. D. Galambos, D. L. Conner, P. L. Goranson, D. C. Lousteau, D. E. Williamson, B. E. Nelson, and F. C. Davis 1993 4 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC05-84OS-21400)
(DE94-002795; CONF-931018-47) Avail: CASI HC A01/MF A01

An analytic parametric scoping tool was developed for application to first wall (FW) design problems. Both thermal and disruption force effects are considered. For the high heat flux and high disruption load conditions expected in the International Thermonuclear Experimental Reactor (ITER) device, Vanadium alloy and dispersion-strengthened copper offer the best stress margins using a somewhat flattened plasma-facing configuration. Ferritic steels also appear to have an acceptable stress margin, whereas the conventional stainless steel 316 does not appear feasible. If a full semicircle shape FW is required, only the Vanadium and ferritic steel alloy have acceptable solutions. DOE

NEW CONDITIONING PROCEDURE DERIVED FROM OPERATING EXPERIENCE WITH THE COMMON LONG-PULSE ION SOURCE
B. G. Scoville, M. Madruga, R. M. Hong, and J. C. Phillips Oct. 1993 3 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC03-89ER-51114)
(DE94-002891; GA-A-21422; CONF-931018-59) Avail: CASI HC A01/MF A01

The DIII-D neutral beam system utilizes an 80 kV version of the Common Long-Pulse Ion Source designed by Lawrence Berkeley Laboratories (LBL) and originally built by RCA. Eight of these ion sources are mounted on four beamlines to provide a total of 20 MW of injected deuterium neutral power to the DIII-D tokamak. To support the DIII-D one-shift operation, neutral beams must be readied in a relatively short period of time each day, typically one hour. During non-operating periods conditioning time for the ion sources is limited, due to the costs of associated support services and the need to perform corrective and preventive maintenance. The experience gained over a six year period resulted in finely tuned procedures for the conditioning and operation of these ion sources. Recently, an ion source was conditioned which had been accidentally filled with water for several days, resulting in surface corrosion and deconditioning of the grids and surfaces. The method of successful recovery along with data, experience and procedures derived this event and normal operations are detailed and discussed. DOE

INTERNATIONAL BULLETIN ON ATOMIC AND MOLECULAR DATA FOR FUSION. NO. 42-45, MAR. 1991 - DEC. 1992
J. Botero, ed. Dec. 1992 595 p Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality
(DE94-601817; INIS-mf-4754(no-42-45); IBAMD-42-45) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

The bulletin is published by the International Atomic Energy Agency to provide atomic and molecular data relevant to fusion research and technology. In Part 1 the indexed papers are listed separately for (1) structure and spectra (energy levels, wavelengths; transition probabilities, oscillator strengths; polarizabilities, electric moments; interatomic potentials); (2) atomic and molecular collisions (photon collisions; electro collisions; heavy-particle collisions; homonuclear sequences); and (3) surface interactions (sputtering; trapping, detrapping; adsorption, desorption; surface damage; blistering, flaking; chemical reactions). Part 2 contains the bibliographic data for the above listed topics and for plasma composition and impurities; plasma heating, cooling and fuelling; fusion research of general interest; high energy laser- and beam-matter interaction; interaction of atomic particles with fields. A list of evaluated data bases on atomic and molecular collisions and on particle-surface interactions is also given. DOE

TOKAMAK PHYSICS EXPERIMENT POLOIDAL FIELD DESIGN
R. H. Bulmer Oct. 1993 6 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract W-7405-eng-48)
(DE94-001542; UCRL-JC-114268; CONF-931018-16) Avail: CASI HC A02/MF A01

The Tokamak Physics Experiment (TPX) will have a poloidal field system capable of full inductive operation poloidal for approximately a 20-s flattop and, with superconducting toroidal and poloidal field coils and non-inductive current drive, it will be capable of true steady-state operation. The poloidal field design is based on the ideal magnetohydrodynamic (MHD) equilibrium model as implemented in the TEQ code developed at LLNL. The PF coils are arranged in an up-down symmetric configuration, external to the TF coils. The TPX diverted plasma will have an aspect ratio of 4.5 and is highly shaped with a nominal elongation of 2 and triangularity of approximately 0.8 as measured at the separatrix. The tokamak design is based on a high-current (q(sub (psi))=3) plasma scenario and a low current scenario. Each scenario has an operational flexibility requirement which is defined as a region of plasma pressure and inductivity (beta(sub N) - l(sub i)) space, where the plasma shape is constrained to keep the divertor configuration operational. Single-null plasma configurations are feasible, even with the same divertor hardware, by operating the PF coils asymmetrically. Recently applied optimization techniques have improved the capability of the PF system without additional cost. DOE

RESEARCH IN PULSED POWER PLASMA PHYSICS Final Report
David Hinshelwood and David Rose Nov. 1993 629 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-C-2134)
(AD-A274323) Avail: CASI HC A99

The research was conducted in support of light-ion-driven inertial confinement fusion (ICF) for the Department of Energy (DOE), and nuclear weapon effects simulation (NWES) for the Defense Nuclear Agency (DNA). Accomplishments related to ion beams include: development of a practical backup approach to ion beam transport; the first studies of ion-beam interaction with a neutral gas; initial investigations of a promising industrial application of ion beam technology; and detailed theoretical evaluation of several different ion beam transport schemes. Major accomplishments relating to opening switches include: the first direct measurement of the electron density in an opening switch; detailed studies of switch conduction-time scaling; evaluation of several different switch plasma sources; and extensive studies of switch performance into diode loads, leading to the development of a new (and now generally accepted) model of switch behavior. EXPERIMENTAL AND THEORETICAL INVESTIGATION OF RF ABSORPTION AND REFLECTION FROM PREFORMED PLASMAS Final Report, 30 Sep. 1989 - 30 Sep. 1993
William W. Destler 30 Sep. 1993 71 p
(Grant AF-AFOSR-0488-89)
(AD-A274189; AFOSR-93-0883TR) Avail: CASI HC A04/MF A01

This report constitutes the final progress report for a program of experimental and theoretical research on the reflection, absorption, and scattering of VHF and microwave radiation from plasma-covered conductors. A principal goal of this research is to determine to what extent plasmas can be used to reduce the radar cross-section of highly RF-reflective objects. The major goals of this program were: to study RF absorption and reflection from a plasma-covered plane conductor to determine under what conditions the presence of the plasma can result in a significant reduction in the backscattered RF; to conduct such studies under a wide range of plasma (overdense and underdense) and RF (frequency, power density, and pulse duration) conditions; and to establish a solid theoretical foundation for the understanding of experimental observations. DESIGN AND CONTROL OF PHASED ICRF ANTENNA ARRAYS
R. H. Goulding, F. W. Baity, D. J. Hoffman, P. M. Ryan, J. S. deGrassie (General Atomics Technologies Corp., San Diego, CA.), C. C. Petty (General Atomics Technologies Corp., San Diego, CA.), R. I. Pinsker (General Atomics Technologies Corp., San Diego, CA.), M. Bures (Joint European Torus Project, Abingdon, England.), J. A. Dobbing (Joint European Torus Project, Abingdon, England.), and D. F. H. Start (Joint European Torus Project, Abingdon, England.) et al 1993 5 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC05-84OR-21400)
(DE94-002796; CONF-931018-50) Avail: CASI HC A01/MF A01

Phased antenna arrays operating in the ion cyclotron range of frequencies (ICRF) are used to produce highly directional wave spectra, primarily for use in current drive experiments. RF current drive using phased antennas has been demonstrated in both the JET and DIII-D tokamaks, and both devices are planning to operate new four-element arrays beginning early next year. Features of antenna design that are relevant to phased operation and production of directional spectra are reviewed. Recent advances in the design of the feed circuits and the related control systems for these arrays should substantially improve their performance, by reducing the coupling seen by the matching networks and rf power supplies caused by the mutual impedance of the array elements. The feed circuit designs for the DIII-D and JET phased antenna arrays are compared. The two configurations differ significantly due to the fact that one power amplifier is used for the entire array in the former case, and one per element in the latter. The JET system uses automatic feedback control of matching, phase and amplitude of antenna currents, and the transmitter power balance. The design of this system is discussed, and a time dependent model used to predict its behavior is described. DOE

(JTN-94-80548) Avail: CASI HC A07/MF A02

Experimental results of controlled thermonuclear fusion research on Reversed Field Pinch (RFP) machines, TPE-1RM and TPE-1RM15, are presented. The main experimental results of TPE-1RM, such as RFP configuration formation conditions, insensitivity of RFP configuration to the initial conditions, its dependency on the instantaneous boundary condition, very high temperature measured by Thomson scattering of ruby laser, the ion temperature measured by Doppler broadening of C(4+) line, proportionality of the electron temperature and density to the plasma current, and the linear increase of the ion temperature with the plasma current are outlined. The main experiment results of TPE-1RM15 are as follows: (1) the RFP configuration can be formed by magnetic field control much slower than that in TPE-1RM; (2) the RFP configuration can be sustained by maintaining the plasma current and the reversal of toroidal field; (3) the electron temperature and density are kept nearly constant by sustaining the configuration; (4) the equilibrium position control by the quasi-DC (Direct Current) vertical field is essential for reducing the toroidal loop voltage; (5) the confinement property in the large current region is greatly improved by using purified molybdenum limiters; and (6) the electron density and temperature are roughly proportional to the plasma current. It is demonstrated that the theoretically predicted relaxation towards the RFP configuration exists and the RFP configuration can be formed with the slow formation whose current rise time is in the range of milli-second. FAST WAVE CURRENT DRIVE TECHNOLOGY DEVELOPMENT AT ORNL
F. W. Baity, D. B. Batchelor, R. H. Goulding, D. J. Hoffman, E. F. Jaeger, P. M. Ryan, J. S. deGrassie (General Atomic Co., San Diego, CA.), C. C. Petty (General Atomic Co., San Diego, CA.), R. I. Pinsker (General Atomic Co., San Diego, CA.), and R. Prater (General Atomic Co., San Diego, CA.) 1993 11 p Presented at the IAEA Meeting on Radio-Frequency Launchers for Plasma Heating and Current Drive, Naka, Japan, 10-12 Nov. 1993
(Contract DE-AC05-84OR-21400)
(DE94-004243; CONF-9311140-1) Avail: CASI HC A03/MF A01

The technology required for fast wave current drive (FWCD) systems is discussed. Experiments are underway on DIII-D, JET, and elsewhere. Antennas for FWCD draw heavily upon the experience gained in the design of ICRF heating systems with the additional requirement of launching a directional wave spectrum. Through collaborations with DIII-D, JET, and Tore Supra, rapid progress is being made in the demonstration of the physics and technology of FWCD needed for TPX and ITER. DOE

PROCEEDINGS OF THE 16TH SYMPOSIUM ON PLASMA PHYSICS AND TECHNOLOGY
1993 356 p Symposium held in Prague, Czechoslovakia, 27-29 Apr. 1993 Prepared in cooperation with Ceskoslovenska Akademie Ved, Prague Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-604181; INIS-MF-13714; CONF-9304218) Avail: CASI HC A16 (US Sales Only)

Among 53 papers collected in the proceedings, 28 papers deal with the theory and modelling (8 papers), experimental research (11 papers), and diagnostics of high temperature plasmas. These include lower hybrid current drive in tokamaks, plasma heating by electron beams, laser plasma interaction, and z-pinch experiments. In the diagnostic papers, attention is mostly paid to x ray and optical plasma spectroscopy and to advanced Langmuir probe diagnostics. The remaining papers discuss low temperature plasmas and their applications. In this group, 8 papers deal with low pressure electric discharges; 5 papers with high pressure arcs, glidarcs, and plasma torches; and 12 papers with various plasma technology topics, such as thin film deposition, plasma spraying, and plasma chemistry. SHINE THROUGH MEASUREMENTS WITH HYDROGEN BEAM IN JT-60
Masaaki Kuriyama (Japan Atomic Energy Research Inst., Naka.), Shunsuke Kunieda (Japan Atomic Energy Research Inst., Naka.), Mamoru Matsuoka (Japan Atomic Energy Research Inst., Naka.), Makoto Mizuno (Japan Atomic Energy Research Inst., Naka.), Yoshihiro Ohara (Japan Atomic Energy Research Inst., Naka.), Hiroshi Oohara (Japan Atomic Energy Research Inst., Naka.), and Kazuhiko Mogaki (Japan Atomic Energy Research Inst., Naka.) Mar. 1993 18 p
(DE94-701113; JAERI-M-93-059) Avail: CASI HC A03/MF A01

The shine through rate with hydrogen beams in the JT-60 neutral beam injection experiments was measured in a beam energy range of 40-75 keV and plasma densities of 1-7 x 10(exp 19) m(exp -3) for the estimation of absorbed beam power in the plasma. The shine through rate was calculated from the temperature rise measurement with thermocouples installed in an armor plate. The shine through depends on the plasma density inverse-exponentially and the beam energy linearly. Additionally, the rate changes with the plasma species and the plasma facing materials which effect impurity contamination of the plasma. An enhancement of beam stopping cross section by multistep collisions was also found even in a beam energy range of 40-75 keV. DOE

ATOMIC PROCESSES IN INERTIAL ELECTROSTATIC CONFINEMENT (IEC) DEVICES
R. A. Nebel, L. Turner, T. N. Tiouririne, D. C. Barnes, W. D. Nystrom, R. W. Bussard (Energy/Matter Conversion Corp., Manassas, VA.), G. H. Miley (Illinois Univ., Urbana.), J. Javedani (Illinois Univ., Urbana.), and Y. Yamamoto (Illinois Univ., Urbana.) 1993 10 p Presented at the 9th Biennial Topical Conference on Atomic Processes in Plasmas, San Antonio, TX, 19-23 Sep. 1993
(Contract W-7405-eng-36)
(DE94-005015; LA-UR-93-4482; CONF-9309119-2) Avail: CASI HC A02/MF A01

Inertial Electrostatic Confinement (IEC) is one of the earliest plasma confinement concepts, having first been suggested by P. T. Farnsworth in the 1950's. The concept involves a simple apparatus of concentric spherical electrostatic grids or a combination of grids and magnetic fields. An electrostatic structure is formed from the confluence of electron or ion beams. Gridded IEC systems have demonstrated neutron yields as high as 2(10)(exp 10) neutrons/sec. These systems have considerable potential as small, inexpensive, portable neutron sources for assaying applications. Neutron tomography is also a potential application. Atomic physics effects strongly influence the performance of all of these systems. Important atomic effects include elastic scattering, ionization, excitation, and charge exchange. This paper discusses how an IEC system is influenced by these effects and how to design around them. Theoretical modeling and experimental results are presented. DOE

ADVANCED DEVELOPMENT OF PARTICLE BEAM PROBE DIAGNOSTIC SYSTEM Progress Report, 15 Dec. 1992 - 15 Oct. 1993
T. P. Crowley, P. M. Schoch, and K. A. Connor 1993 10 p
(Contract DE-FG02-85ER-53211)
(DE94-002316; DOE/ER-53211/12) Avail: CASI HC A02/MF A01

This progress report under DOE Grant DE-FG02-85ER3211 covers the period 15 Dec. 1992 through 15 Oct. 1993. The major accomplishments of this period are summarized. The basic TEXT heavy ion beam probe including the primary beam line, the upper secondary beam line with the old 500 keV analyzer, and the lower secondary beam line with the new 2 MeV analyzer is operational, and system shake-down is now beginning. Several subsystems of the complete system design are still under development including secondary beam line sweeps, primary beam detectors, the digital control, and data acquisition system. The lower analyzer entrance aperture and detector plates also have very limited capabilities to make it possible to more rapidly obtain satisfactory initial alignment and calibration conditions. We have performed a variety of high voltage tests that establish the basic efficacy of the 2 MeV analyzer design. We have upgraded the ion optics and added vacuum chambers in our vertical test stand facility to allow us to test the 2 MeV analyzers. We have also constructed a facility for testing ion source characteristics. We analyzed data on primary beam modulation taken during the last run period and confirmed the accuracy of our simulation code. Analysis of magnetic field measurements continued. DOE

REDUCED BRAGINSKII EQUATIONS
M. Yagi and W. Horton Nov. 1993 12 p
(Contract DE-FG05-80ET-53088)
(DE94-003510; DOE/ET-53088/632; IFSR-632) Avail: CASI HC A03/MF A01

A set of reduced Braginskii equations is derived without assuming flute ordering and the Boussinesq approximation. These model equations conserve the physical energy. It is crucial at finite (beta) that we solve the perpendicular component of Ohm's law to conserve the physical energy while ensuring the relation (del) (center dot) j = 0. DOE

PASSIVE STABILIZATION OF MHD INSTABILITIES AT HIGH (BETA)n IN THE HBT-EP TOKAMAK Ph.D. Thesis
D. A. Gates 1993 133 p
(Contract DE-FG02-86ER-53222)
(DE94-003317; DOE/ER-53222/108) Avail: CASI HC A07/MF A02

The HBT-EP Tokamak has been designed, built, and is now fully operational in the Columbia University Plasma Physics Laboratory. One of the primary purposes of this facility is to study the effects of a conducting wall on the MHD modes that lead up to plasma disruptions. Of particular interest are the types of instabilities that are driven by the kinetic pressure of the plasma, because these instabilities are believed to be responsible for the present limit to plasma Beta with Beta proportional to (p)/B(exp 2), where the (p) is the volume averaged pressure and B is the magnetic field. To this end, a movable conducting wall has been installed inside the HBT-EP vacuum chamber. The primary result of this thesis is the initial results from experiments that study the effect of this wall on plasma instabilities. The experiment shows that the conducting wall significantly reduces the growth rate of instabilities that precede a plasma disruption that occurs when the value of (beta) is near the Troyon limit. The location of the wall required for significant stabilization is b/a approximately 1.2 where a is the minor radius of the plasma and b is the minor radial location of the wall. Moving the wall closer than $b/a = 1.2$ slightly degrades the stabilizing effect, which is consistent with recent theories. DOE

A collaborative program was initiated to measure helium (He) transport and exhaust on DIII-D in L-mode, ELM-free H-mode, and ELMing H-mode. These diverted plasmas operating in enhanced confinement regimes should provide valuable information for the International Thermonuclear Experimental Reactor (ITER). To simulate the presence of He ash in DIII-D, a 50 ms He puff is injected into a DIII-D plasma, resulting in a He concentration of approximately 15%. The time dependence of the He density profiles in the plasma core is measured with charge-exchange recombination spectroscopy and the He spatial distribution on the diverter floor is studied with an impurity monitor array. The dependence of core transport diffusivities as a function of ELM frequency were studied and the first demonstration made of He exhaust from an H-mode plasma in a diverted tokamak. The exhaust rate of He from these ELMing H-mode plasmas appears to be within the acceptable range for a fusion reactor, like ITER, based on a measured value of (tau)*(sub He)/(tau)E approximately 14. FUEL ION ROTATION MEASUREMENT AND ITS IMPLICATIONS ON H-MODE THEORIES
J. Kim, K. H. Burrell, P. Gohil, R. J. Groebner, F. L. Hinton, Y. B. Kim, R. Seraydarian, W. Mandl (Max-Planck-Inst. fuer Plasmaphysik, Garching, Germany.), and M. R. Wade (Oak Ridge National Lab., TN.) Oct. 1993 6 p Presented at the IAEA Meeting on H-Mode Physics, Naka, Japan, 15-17 Nov. 1993
(Contract DE-AC03-89ER-51114)
(DE94-004860; GA-A-21507; CONF-9311147-2) Avail: CASI HC A02/MF A01

Poloidal and toroidal rotation of the fuel ions (He(2+)) and the impurity ions (C(6+) and B(5+)) in H-mode helium plasmas were investigated in the DIII-D tokamak by means of charge exchange recombination spectroscopy, resulting in the discovery that the fuel ion poloidal rotation is in the ion diamagnetic drift direction while the impurity ion rotation is in the electron diamagnetic drift direction. The radial electric field obtained from radial force balance analysis of the measured pressure gradients and rotation velocities is shown to be the same regardless of which ion species is used and therefore is a more fundamental parameter than the rotation flows in studying H-mode phenomena. It is shown that the three contributions to the radial electric field (diamagnetic, poloidal rotation, and toroidal rotation terms) are comparable and consequently the poloidal flow does not solely represent the E x B flow. In the high-shear edge region, the density scale length is comparable to the ion poloidal gyroradius, and thus neoclassical theory is not valid there. In view of this new discovery that the fuel and impurity ions rotate in opposite sense, L-H transition theories based on the poloidal rotation may require improvement. DOE

PERFORMANCE OF A 14-MeV NEUTRON GENERATOR AS AN IN SITU CALIBRATION SOURCE FOR TFTR
A. L. Roquemore (Princeton Univ., NJ.), D. L. Jassby (Princeton Univ., NJ.), L. C. Johnson (Princeton Univ., NJ.), J. D. Strachan (Princeton Univ., NJ.), and C. W. Barnes 14 Oct. 1993 6 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contracts W-7405-eng-36; DE-AC02-76CH-03073)
(DE94-004993; LA-UR-93-4234; CONF-931018-77) Avail: CASI HC A02/MF A01

TFTR will soon enter its D-T phase with the introduction of tritium. This will result in the production of neutrons having 14-MeV energy which is significantly greater than the 2.5-MeV neutrons encountered during D-D operation. In preparation for the D-T phase, a calibration of the four neutron detection systems was performed using a 14-MeV neutron generator producing 10(exp 8) n/sec. To account for the spatial extent of the toroidally shaped plasma and for neutrons scattered from surrounding structures, detector responses were determined with the source positioned at many locations inside the vacuum vessel. Before the generator could be used as a calibration source, a characterization of its total yield and angular emission properties was obtained. The total yield was determined by aluminum activation methods to within +/- 6%, while the angular emission was found to be anisotropic in the forward and reverse cones along the generator axis. After the characterization was performed, the generator was mounted on a moveable track inside the vacuum vessel, where it could be remotely moved across the view of each detector. This paper presents details of the methods and results of the source characterization, together with initial results of the in-vessel D-T neutron calibration. DOE

FAST H-ALPHA LINE BROADENING DURING THE 100 ns REB INJECTION INTO A PLASMA
K. Kolacek, M. Ripa, J. Ullschmied, K. Jungwirth, and P. Sunka Jun. 1992 7 p
(IPPCZ-322) Avail: CASI HC A02/MF A01

Profiles of the H-alpha line emitted from the hot electron plasma Te much greater than Ti during the 100 ns REB injection resemble the Gaussian ones from neutrals with a temperature Tn(t) approximately equal to Ti(t) approximately equal to Te(t) rapidly growing up to 30 eV. Combination of Doppler and Stark effects of the intense ion sound waves - remnants of the burned out Langmuir cavitons - is suggested for plausible explanation of this fast H-alpha line broadening. Reliability of the basic ideas of strong Langmuir turbulence for description of REB-plasma systems is thus indirectly supported, too. Author

PRELIMINARY CONSIDERATIONS ON THE DIFFRACTION (QUASI-OPTICAL) GRILL IN CASTOR TOKAMAK
R. Klima Sep. 1993 9 p
(IPPCZ-335) Avail: CASI HC A02/MF A01

An original system for launching lower hybrid waves (LHW) into tokamak plasmas has been suggested. The purpose of the present note is to give simple estimates of possibility to verify this new quasi-optical grill at the CASTOR tokamak. We briefly estimate the accessibility, the spectrum expected, and the directivity in connection with the penetration through the evanescence layer. A schematic sketch of the proposed launching system in CASTOR tokamak is included in this document. Derived from text

(DE94-604986; INIS-mf-13724) Avail: CASI HC A05 (US Sales Only)

The determination of plasma cross section shape in tokamaks is an important diagnostic method for equilibrium conditions analysis. In this work, a time dependent variation of the plasma column cross section in the Novillo Tokamak is obtained. The experimental method is based on using one magnetic probe, which is installed inside of the vacuum vessel in a 1 mm wall thickness stainless steel tube, in the protected region of the limiter shadow. The plasma column cross section is determined by measuring the poloidal magnetic field produced by the plasma current. This method, now running for determining the plasma column shape, requires the measurement of magnetic field present outside plasma column. The measurements are carried out from a set of small coils, which are located inside the vacuum chamber in the radial and poloidal direction, so the magnetic field with no current attenuations produced by the penetration time of the stainless steel vacuum chamber can be measured. The magnetic probes detect a real time variation of magnetic flux passing through them. In order to obtain the magnetic field values, it is required that the electric signals coming from the magnetic probe be integrated; this operation is carried out by active circuits located between the probe signal and one oscilloscope. The integrated signals can be exhibited by photographs of the oscilloscope display. DOE

ANALYSIS OF DENSITY LIMIT AND EFFICIENCY IN LOWER HYBRID CURRENT DRIVE
Yong-Xiang Yin (Southwest Inst. of Physics, Sichuan, China.) and Xiao-Dong Li (Southwest Inst. of Physics, Sichuan, China.) Jul. 1992 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-604995; CNIC-00665; SIP-0053) Avail: CASI HC A02 (US Sales Only)

The conditions of accessibility and parameter decay instability as well as the power spectrum are used to analyze the density limit and efficiency of lower hybrid current drive (LHCD). For convenience of the analysis, an equal-N(sub parallel) curve and an operation curve are defined, where N(sub parallel) is the refractive index of lower hybrid wave parallel to toroidal magnetic field. By means of the two kinds of curves, the dependences of density limit and efficiency of LHCD on toroidal magnetic field B(sub 0) pump frequency f(sub 0), electron density n(sub c), and electron temperature T(sub e) are obtained, which are in good agreement with LHCD experiments on most tokamaks. A new tokamak model is presented in which the tokamak components are treated together as an electrical circuit and the effects of turbulent heating (TH) on the circuit elements are included. The plasma dynamics is approximated with linear time-invariant state equations. The simple model was used to study the behavior of the system around an operating point of interest. Based on this study, a control system was designed. Simulation results showed that the plasma position is rather insensitive to variation in the time constant of the control current driver system as long as it is under 1.4 ms. It was also shown that the presence of the iron core results in unstable roots in the open loop plasma position Laplace transfer function. A least squares error algorithm was used to determine improved estimates of the model parameters. A control strategy for plasma position using analog control during ohmic heating (OH) was developed and successfully demonstrated. However, rapid changes in plasma parameters during and after TH were shown to require adaptive control. A suitable digital controller was designed, built, and verified for controlling plasma position after a TH pulse. The final result is a stably controlled plasma that can be maintained for the entire duration of a plasma discharge, for both the OH and TH modes. Author (CISTI)

We have developed a novel molecular beam mass spectrometry technique that can quantitatively analyze the gas-phase composition in a CVD reactor. The technique simultaneously monitors a wide variety of radical and stable species, and their concentrations can be determined with sensitivities approaching 1 ppM. Measurements performed in a diamond deposition system have given us keen insights into the important phenomena that affect the growth environment. This paper first discusses the primary gas sampling design issues. In the second part, the details of the experimental results and their implications will be described. DOE

HEAVY-ELECTRON BEHAVIOR IN LARGE COORDINATION COMPOUNDS CeZn11 AND UZn12
Yasuhiro Nakazawa, Masayasu Ishikawa, Satoru Noguchi (Osaka Prefecture Univ., Sakai, Japan.), and Kiichi Okuda (Osaka Prefecture Univ., Sakai, Japan.) Mar. 1993 16 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan
(ISSN 0082-4798)
(Rept-A-2663; JTN-94-80534) Avail: CASI HC A03/MF A01

Two intermetallic compounds, CeZn11 and UZn12, were investigated, for heavy-electron behavior and found that the gamma value of low-temperature specific heat amounts to about 1.5 J/(mol sq K) for CeZn11 and 850 - 900 mJ/(mol sq K) for UZn12. CeZn11 exhibited an antiferromagnetic long-range order at 2.0 K evidenced by a large peak of specific heat and a broad maximum in the susceptibility, while UZn12 did neither superconducting nor magnetic phase transition down to 0.4 K. BINDING OF COPPER AND NICKEL TO CAVITIES IN SILICON FORMED BY HELIUM ION IMPLANTATION

S. M. Myers, D. M. Follstaedt, and D. M. Bishop 1993 6 p Presented at the Fall Meeting of the Materials Research Society, Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC04-94AL-85000)
(DE94-003769; SAND-93-1453C; CONF-931108-7) Avail: CASI HC A02/MF A01

Cavities formed in Si by He ion implantation and annealing are shown to be strong traps for Cu and Ni impurities. Experiments utilizing ion-beam analysis and transmission electron microscopy indicate that Cu is trapped at the internal surfaces of cavities up to approximately 1 monolayer coverage with a binding energy of 2.2 +/- 0.2 eV relative to solution. This is greater than the heat of solution from the precipitated Cu3Si phase, determined to be 1.7 eV in agreement with earlier work. Copper at cavity-wall sites is reversibly replaced by H during heating in H2 gas, indicating the relative stability of the two surface terminations. Initial results for Ni impurities indicate that trapping at cavities is again energetically preferred to silicide formation. The saturation coverage of Ni on the internal surfaces, however, is an order of magnitude smaller for Ni than Cu, consistent with published studies of external-surface adsorption. These results suggest that cavity trapping may getter metallic impurities in Si more effectively than methods based on silicide precipitation. DOE

HYDROGEN UPTAKE INTO SILICON FROM AN ECR PLASMA

W. R. Wampler and J. C. Barbour 1993 19 p Presented at the 40th National Symposium of the American Vacuum Society, Orlando, FL, 15-19 Nov. 1993
(Contract DE-AC04-94AL-85000)
(DE94-003771; SAND-93-1159C; CONF-9311104-14) Avail: CASI HC A03/MF A01

The concentration of hydrogen in solution near the surface of silicon exposed to an electron cyclotron resonance (ECR) plasma was determined by measuring the flux of hydrogen permeating to subsurface microcavities. The energy and flux of hydrogen impinging onto the surface from the plasma was also measured. A model is described which predicts the concentration of hydrogen in solution from the energy and flux of the impinging hydrogen. The measured solution concentrations were approximately 10(exp -9) H/Si at 600 C and approximately 10(exp -8) H/Si at 400 C, in fairly good agreement with the model. The absence of accumulation of immobile hydrogen near the surface indicates that lattice defects, which strongly trap hydrogen, were not produced by the ECR plasma. This study establishes a connection between the properties of the ECR plasma and the concentration of hydrogen in silicon samples exposed to the plasma, which allows improved control over passivation of defects and dopants. MICROSCOPIC STUDY OF LOCAL STRUCTURE AND CHARGE DISTRIBUTION IN METALLIC La2CuO(4+DELTA)

P. C. Hammel (Los Alamos National Lab., NM.), A. P. Reyes (Los Alamos National Lab., NM.), E. T. Ahrens (Los Alamos National Lab., NM.), Z. Fisk (Los Alamos National Lab., NM.), P. C. Canfield (Los Alamos National Lab., NM.), J. D. Thompson (Los Alamos National Lab., NM.), and J. E. Schirber 29 Oct. 1993 22 p Presented at the 2nd Workshop on Phase Separation in Cuprate Superconductors, Cottbus, Germany, 4-10 Sep. 1993
(Contract DE-AC04-94AL-85000)
(DE94-003801; SAND-93-2709C; LA-UR-93-3836; CONF-9309283-2) Avail: CASI HC A03/MF A01

The authors employ NMR and NQR spectroscopy as probes of local structure and charge environments in metallic La2CuO(4+delta) (Tc= 38 K). They discuss the effect of annealing the sample at various temperatures T(sub a) (Tc less than T(sub a) less than 300 K) on the superconducting (Tc). The dependence of (Tc) on annealing indicates that annealing allows the development of structural order which is important for (Tc). The La-139 quadrupole frequency, nu(sub Q) is smaller than in undoped materials. This is unexpected and may indicate a smaller charge on the apex oxygen in the doped material and thus a different distribution of charge between the La-O layer to the planes. The further, rapid decrease in nu(sub Q) just above (Tc) indicates that temperature dependent charge redistribution is occurring. The presence of doped holes induces a distribution of displacements of the apex oxygen off of the vertical La-Cu bond axis. These vary from zero to the value observed in lightly doped (antiferromagnetic) La2CuO(4+delta). These measurements demonstrate a striking degree of inhomogeneity in the crystal structure of the La-O layer. Copper NQR spectroscopy shows that there are two distinct copper sites in the CuO2 planes and thus that either the structure or the charge distribution in the planes is inhomogeneous as well. These inhomogeneities are the intrinsic response of the crystal to doped holes; they are not the result of distortions of the lattice due to the presence of interstitial oxygen atoms. DOE

VOLUME DEPENDENCE OF VANADIUM MAGNETISM

M. E. Elzain Jul. 1993 11 p
(DE94-601838; IC-93/224) Avail: CASI HC A03/MF A01 (US Sales Only)

The first principle discrete variational method in the spin polarized local density approximation is used to calculate the local properties of 15 atom clusters representing variable crystal size bcc vanadium. Four distinct magnetic configurations are recognized as the lattice constant varies from 5.4 to 8.4 (a.u.). At the lowest end the clusters are paramagnetic (PM) whereas at the upper end clusters are ferromagnetic (FM). In between antiferromagnetic couplings prevail. The local magnetic moment increases, in a fashion not unlike second order transitions, from zero in the PM range to non-zero values in the AFM region. Transitions between other phases are first order. The systematics of these transitions are ascribed to the general shape of the density of states. The contact magnetic hyperfine field, charge density and 3d partial occupations at the central sites are also calculated. DOE

FLUX FLOW, PINNING, AND RESISTIVE BEHAVIOR IN SUPERCONDUCTING NETWORKS

S. Teitel Oct. 1993 9 p
(Contract DE-FG02-89ER-14017)
(DE94-003400; DOE/ER-14017/5) Avail: CASI HC A02/MF A01

The behavior of fluctuation effects in superconducting systems was studied using numerical simulations of XY and Coulomb gas models. The fluctuation of vortex lines in high temperature superconductors, in the presence of an external magnetic field, has been studied using a three dimensional XY model. The existence of two distinct phase transitions was verified in this model. As the vortex line lattice is heated, it melts first into a line liquid where superconductivity is destroyed for currents perpendicular to the applied magnetic field, but persists for currents parallel to the field. As heating continues, the thermal excitation of closed vortex line loops links all the lines together, leading to completely normal metal properties in all directions. Upon cooling of the vortex line liquid, as the system width increases, one can get trapped into an entangled nonequilibrium state in which vortex line cuttings are frozen out on measurable time scales. Simulations were continued of the two dimensional Coulomb gas, as a model for vortex fluctuations in two dimensional arrays of Josephson junctions, and thin film superconductors. Preliminary results support the accepted view of a Kosterlitz-Thouless melting of the vortex lattice, in the limit of a uniform continuous film. DOE

ON THE ESTIMATION OF MATRIX ELEMENTS FOR OPTICAL TRANSITIONS IN SEMICONDUCTORS
A. R. Hassan Sep. 1992 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-613550; IC-92/221) Avail: CASI HC A03 (US Sales Only)

A semi-empirical method is used to calculate the numerical values of the interband momentum matrix elements of the allowed optical transitions in semiconductors. This method is based on the evaluation of the ratio of the two-photon and one-photon absorption coefficients and the compare the result with the corresponding experimental values in a number of semiconductors both for direct and indirect transition processes. The numerical values of the momentum matrix elements are compared with the convenient theoretical calculations available. The result is found to agree fairly well with the corresponding values computed using the k-vector (center dot) p-vector perturbation theory. DOE

ELECTRICAL PROPERTIES OF p-TYPE GaInP2 M.S. Thesis
Roy S. Calfas Dec. 1993 52 p
(AD-A273771; AFIT/GAP/ENP/93D-01) Avail: CASI HC A04/MF A01

The GaInP2 n(+)-p junction diode has recently become important to the development of high efficiency GaInP2/GaAs dual junction solar cells, which have a demonstrated air mass 1.5 conversion efficiencies in excess of 27%. In order to study the effects of long term exposure to the space environment, the GaInP2 n(+)-p junction diodes were irradiated with a 1 MeV electron beam with a fluence of 10(exp 16) electrons/sq cm. Since little is known about deep level defects (traps) in GaInP2, a deep level transient spectroscopy (DLTS) study was made to characterize the traps that are thought to dominate the dark current in GaInP2 solar cells. The measurements indicated that there are a number of majority carrier traps in the p-type base of the GaInP2 n(+)-p junction diode. Traps that are identified are located 0.12 to 0.55 eV above the valence band and are attributed to phosphorous vacancies in the lattice. DTIC

FERMIONIC FIELD THEORY AND GAUGE INTERACTIONS ON RANDOM LATTICES
C. J. Griffin and T. D. Kieu 1993 16 p
(DE94-601565; UM-P-93/05) Avail: CASI HC A03/MF A01 (US Sales Only)

Random-lattice fermions were shown to be free of the doubling problem if there are no interactions or interactions of a non-gauge nature. However, gauge interactions impose stringent constraints as expressed by the Ward-Takahashi identities which could revive the free-field suppressed doubler modes in loop diagrams. After introducing a formulation for fermions on a new kind of random lattice, random, naive and Wilson fermions are compared in two dimensional Abelian background gauge theory. It is shown that the doublers are revived for random lattices in the continuum limit, while demonstrating that gauge invariance plays the critical role in this revival. Some implications of the persistent doubling phenomenon on random lattices are also discussed. DOE

LIGHTER ALKALI HYDRIDE AND DEUTERIDE 1: ELECTRONIC PROPERTIES OF PURE SOLIDS
A. K. M. A. Islam Oct. 1992 61 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616188; IC-92/344) Avail: CASI HC A04 (US Sales Only)

The properties of lighter alkali hydrides of metals which crystallize in the rock-salt structure are discussed. First, the properties of pure crystals which are dominated by the electrons, in particular the energy levels and the eigenstates of the electrons in the absence of lattice defects are considered. After that, the optical properties of the solids excited at photon energies larger than those appropriate to lattice vibration and dominated by the transition of electron from the occupied core and valence levels to the normally empty conduction states, are discussed. SUCCESSIVE STRUCTURAL PHASE TRANSITIONS IN STOICHIOMETRIC La2NiO4 OBSERVED BY X RAY DIFFRACTION
Akihiko Hayashi, Hiroyasu Tamura, and Yutaka Ueda Apr. 1993 18 p
Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan
(ISSN 0082-4798)
(Rept-A-2665; JTN-94-80536) Avail: CASI HC A03/MF A01

Phase transition in La2NiO4+delta near stoichiometric oxygen content has been studied between 10 and 800 K by powder X-ray diffraction. In addition to a second-order transition from a High-Temperature Tetragonal (HTT) phase into a Low-Temperature Orthorhombic (LTO1) phase at 700 K on cooling, a transition into another orthorhombic (LTO2) phase was observed at 75 K. The LTO2 phase developed into domains large enough for X-ray powder diffraction. The study made it evident that the LTO2 phase is apparently an orthorhombic one and the second transition is of first-order. The nature of phase transitions in La2MO4 (M = Ni, Cu) is also discussed in relation to the temperature dependence of the orthorhombicity. Author (NASDA)

IN SITU X RAY REFLECTIVITY MEASUREMENTS OF THIN FILM STRUCTURAL EVOLUTION
E. Chason and M. Chason (Motorola, Inc., Schaumburg, IL.) 1993 17 p
Presented at the 40th National Symposium of the American Vacuum Society (AVS), Orlando, FL, 15-19 Nov. 1993
(Contract DE-AC04-94AL-85000)
(DE94-002289; SAND-93-1146C; CONF-9311104-7) Avail: CASI HC A03/MF A01

X ray reflectivity using energy dispersive x ray detection has been used to investigate vacuum deposited thin films. A resolution of 0.3 nm for thickness in the range of 3 to 200 nm and of 0.05 nm for roughness in the range of 0.1 to 3 nm has been demonstrated. Further, it is shown that by using energy dispersive detection, spectra can be obtained in less than 500 s allowing real time studies to be performed. Thin, discrete Cr/Al deposits on quartz substrates have been investigated and the presence of a 1.5 nm thick Al/Cr intermetallic layer formed during room temperature deposition has been determined. During annealing at 250 C, the Cr layer thickness decreases linearly with time until approximately 4 nm is consumed in additional intermetallic formation; further annealing does not change the Cr layer thickness. OPTICAL CONDUCTIVITY AND RESISTIVITY IN THE TWO-BAND EMERY MODEL
Tran Minh-Tien Jul. 1993 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601943; IC-93/177) Avail: CASI HC A03 (US Sales Only)

The temperature and frequency-dependent conductivity due to the scattering of oxygen holes by antiferromagnetic spin fluctuations of the copper spins in the two-band Emery model is calculated by means of the memory function method. Using the dynamic spin susceptibility obtained in mean field Schwinger boson approach, the resistivity reveals a crossover from a quadratic to a linear temperature dependence. The scattering rate

of quasiparticles appears to be proportional to frequency. At the same time, the optical conductivity contains a Druke peak around zero frequency. From these results it is concluded that the normal-state basal-plane resistivity and optical conductivity of high-Tc superconductors may be explained by two dimensional spin-fluctuation scattering in the Fermi-liquid picture.

TRAPPED ELECTRONS IN SOLID HYDROGEN
G. W. Collins, F. Magnotta, E. R. Mapoles, and H. E. Lorenzana Jun. 1993 15 p Presented at the AFOSR) High Energy Density Materials Contractors Conference, Woods Hole, MA, 6-8 Jun. 1993
(Contract W-7405-eng-48)
(DE93-018628; UCRL-JC-114006; CONF-9306212-1) Avail: CASI HC A03/MF A01

We report here a relatively large increase in emission of the integrated 800 nm line when pumping the UV absorption and a much smaller increase (by a factor of approximately 15) upon pumping the IR absorption band in solid D-T at 4.6 K. These data show the 800 run emission is most likely the result of an electron bubble transition. We also present ESR data for electrons in D2 and H2 doped with 2% T2 and pure T2. We find there are two components to this absorption, a narrow line component which we attribute to trapped electrons and a broad line component which we attribute to delocalized electrons. The narrow ESR linewidth in the H2 and D2 samples are commensurate with the idea of electrons localized in vacancy seeded traps. In solid T2 the broad line dominates, implying that most electrons are delocalized due to the large concentration of electrons and other impurities. We find that the temperature and time dependence of the electron concentration from the 800 nm line is similar to the unpaired atoms as measured previously with ESR. DOE

THE STRUCTURAL, CHEMICAL, AND ELECTRICAL PROPERTIES OF He-IMPLANTATION-INDUCED NANOCAVITIES IN SILICON
C. H. Seager, S. M. Myers, D. M. Follstaedt, H. J. Stein, and W. R. Wampler 1993 20 p Presented at the 3rd Workshop on the Role of PointDefects/Defect Complexes in Silicon Device Fabrication, Vail, CO, 16-18 Aug. 1993
(Contract DE-AC04-94AL-85000)
(DE94-002681; SAND-93-1725C; CONF-9308191-1) Avail: CASI HC A03/MF A01

Si implanted with He to doses of about 2 x 10(exp 16) cm(sup -2) and greater and annealed at high temperatures develops a layer of internal nanocavities near the end of the He range. Above an annealing temperature of 700 C, all the implanted He escapes from these implanted samples, and the resultant internal cavity surfaces can be shown to possess a high density of chemically reactive Si dangling orbitals. These structures, in addition to possessing a variety of interesting electronic properties, were recently shown to hold great promise as getters for removing undesirable impurities from the silicon matrix. Some of the structural features of these nanocavities and studies which were used to accurately determine the binding energy of H and Cu to Si atoms at the cavity walls are described. Recently, they also demonstrated that these nanocavities capture large densities of majority carriers in n- and p-type silicon. These electrical measurements demonstrated that the nanocavity electronic states possess both acceptor and donor levels in the Si forbidden gap. The approximate location of these levels was determined by a variety of different types of capacitance transient spectroscopy. DOE

TEMPERATURE DEPENDENCE OF THE RADIATION INDUCED CHANGE OF DEPLETION VOLTAGE IN SILICON PIN DETECTORS
H. J. Ziock, K. Holzscheiter, A. Morgan, A. P. T. Palounek, J. Ellison (California Univ., Riverside.), A. P. Heinson (California Univ., Riverside.), M. Mason (California Univ., Riverside.), S. J. Wimpenny (California Univ., Riverside.), E. Barberis (California Univ., Santa Cruz.), and N. Cartiglia (California Univ., Santa Cruz.) et al 1993 9 p Presented at the Nuclear Science Symposium, San Francisco, CA, 2-5 Nov. 1993
(Contract W-7405-eng-36)
(DE94-002705; LA-UR-93-3811; CONF-931107-8) Avail: CASI HC A02/MF A01

The silicon microstrip detectors that will be used in the SDC experiment at the Superconducting Super Collider (SSC) will be exposed to very large fluences of charged particles, neutrons, and gammas. A study of how temperature affects the change in the depletion voltage of silicon PIN detectors damaged by radiation is presented. The initial radiation damage and the short-term and long-term annealing of that damage as a function of temperature in the range from -10 C to +50 C, and as a function of 800 MeV proton fluence up to 1.5 x 10(exp 14) p/cm(sup 2) was studied. They express the pronounced temperature dependencies in a simple model in terms of two annealing time constants which depend exponentially on the temperature. DOE

INVESTIGATION OF PLASMA ETCH INDUCED DAMAGE IN COMPOUND SEMICONDUCTOR DEVICES
R. J. Shul, M. L. Lovejoy, D. L. Hetherington, D. J. Rieger, G. A. Vawter, J. F. Klem, and M. R. Melloch (Purdue Univ., West Lafayette, IN.) 1993 19 p Presented at the 40th National Symposium of the American Vacuum Society, Orlando, FL, 15-19 Nov. 1993
(Contract DE-AC04-94AL-85000)
(DE94-002849; SAND-93-1171C; CONF-9311104-10) Avail: CASI HC A03/MF A01

We have investigated the electrical performance of mesa-isolated GaAs pn-junction diodes to determine the plasma-induced damage effects from reactive ion and reactive ion beam etching. A variety of plasma chemistries (SiCl4, BCl3, BCl3/Cl2, and Cl2) and ion energies ranging from 100 to 400 eV were studied. We have observed that many of the RIE BCl3/Cl2 plasmas and RIBE Cl2 plasmas yield diodes with low reverse-bias currents that are comparable to the electrical characteristics of wet-chemical-etched devices. The reverse-bias leakage currents are independent of surface morphology and sidewall profiles. DOE

THREE-WAVE NONLINEAR INTERACTIONS IN KTiOPO4 (KTP) AND KTP ISOMORPHS Final Report, May - Sep. 1993
Dale L. Fenimore and Kenneth L. Schepler 14 Sep. 1993 119 p
(AD-A274079; WL-TR-93-5029) Avail: CASI HC A06/MF A02

This document reports an investigation of three-wave interactions in positive (nonlinear) biaxial crystals-specifically, the crystal KTiOPO4 (KTP) and its crystallographic isomorphs: RbTiOPO4 (RTP), KTiOAsO4 (KTA), RbTiOAsO4 (RTA), and CsTiOAsO4 (CTA). The results are characterized in terms of phase matching angles, effective nonlinear coefficients, and walkoff angles for the optical beams. In phase matching angles, RTP and CTA showed larger variations in theta (i.e., were more birefringent) than the other isomorphs (which were more uniaxial-like). Where KTP did not have the largest d(eff) the difference from the isomorph which did was typically no more than 0.7 pm/V. Although overall walkoff was less than 3 deg for all isomorphs; the arsenates had around half the walkoff of the phosphates. Strictly from a performance characteristics basis, for uses at wavelengths less than 2.75 microns there is little reason to select one of the other isomorphs over KTP. RTP is acceptable for OPO usage to 3.17 microns, though an arsenate, CTA, is a better choice (higher d(eff) less walkoff, and negligible absorption). Above 3.2 microns, the arsenates, with their smaller walkoff angles and minimal absorption losses, are considerably better choices than the phosphates. DTIC

FIRST PRINCIPLE CALCULATION FOR MAGNETO-CRYSTALLINE ANISOTROPY
Z. Zeng, Q. Q. Zheng (Academia Sinica, Hefei, China.), and W. Y. Lai (Academia Sinica, Beijing, China.) Jun. 1993 12 p
(DE93-634653; IC-93/140) Avail: CASI HC A03/MF A01 (US Sales Only)

Magneto-crystalline anisotropy of permanent magnetic material has been discussed based on the first principle electronic structure calculations. Three methods are applied to evaluate the magneto-crystalline anisotropy of the R2Fe17A(delta) compounds. The crystal field parameters are obtained from correcting the point charge model by (1) using the real space charge distribution from the cluster model calculation; (2) directly calculating the crystal field parameters from the crystal field potential in the embedded cluster model; and (3) taking into account the spin-orbit coupling by perturbation calculation in a semi-relativistic embedded cluster approach. The obtained results are in agreement with the experiments. DOE

ORIENTED LEAD ZIRCONATE TITANATE THIN FILMS: CHARACTERIZATION OF FILM CRYSTALLIZATION
J. A. Voigt, B. A. Tuttle, T. J. Headley, M. O. Eatough, D. L. Lamppa, and D. Goodnow 1993 8 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 12-16 Apr. 1993
(Contract DE-AC04-94AL-85000)
(DE94-003104; SAND-92-2905C; CONF-930405-50) Avail: CASI HC A02/MF A01

Film processing temperature and time was varied to characterize the pyrochlore-to-perovskite crystallization of solution-derived PZT 20/80 thin films. 3000 (Angstrom) thick films were prepared by spin deposition using group of zone axes (100) single crystal MgO as substrate. By controlled rapid thermal processing, films at different stages in the perovskite crystallization process were prepared with the tetragonal PZT 20/80 phase being group of z one axes (100)/(001) oriented relative to the MgO surface. An activation energy for the conversion process of 326 kJ/mole was determined by use of an Arrhenius expression using rate constants found by application of the method of Avrami. Activation energy for formation of the PZT 20/80 perovskite phase of the solution-derived films compared favorably with that calculated from data by Kwok and Desu for sputter-deposited 3500 (Angstrom) thick PZT 55/45 films. Similarity in activation energies indicates that the energetics of the conversion process are not strongly dependent on the method used for film deposition. DOE

GRAIN BOUNDARY DEGRADATION OF YBCO SUPERCONDUCTORS SINTERED IN CO2-CONTAINING ATMOSPHERES
U. Balachandran, K. L. Merkle, J. N. Mundy, Y. Gao (New Mexico Inst. of Mining and Technology, Socorro.), C. Zhang (San Jose State Univ., CA.), D. Xu (San Jose State Univ., CA.), and G. Selvaduray (San Jose State Univ., CA.) Nov. 1993 18 p Presented at the 1st Meeting of the Pacific Rim Ceramic Societies, Honolulu, HI, 7-10 Nov. 1993
(Contract W-31-109-eng-38)
(DE94-003206; ANL/ET/CP-78725; CONF-931142-4) Avail: CASI HC A03/MF A01

The transport critical current density (J(sub c)) of YBCO superconductors decreased with increasing CO2 partial pressure in the sintering atmosphere and ultimately reached zero, even though magnetization measurements showed that the bulk of the samples with zero J(sub c) remained superconducting. The microstructure and composition of the samples was investigated by high resolution transmission electron microscopy and secondary-ion mass spectroscopy (SIMS). Microbeam SIMS indicated carbon segregation at grain boundaries (GB's). Approximately 10% of the GB's were coated with a thin layer of a second phase, deduced to be BaCuO2 and BaCu2O2. Near some grain boundaries, the structure was tetragonal within several tens of nm of the boundaries. The degradation of J(sub c) is discussed in terms of the partial pressure of CO2 and the processing temperatures. Detailed examination of GB microstructures is given in this paper. DOE

BUCKYBALL MICROWAVE PLASMAS: FRAGMENTATION AND DIAMOND-FILM GROWTH
D. M. Gruen, Shengzhong Liu, A. R. Krauss, and Xianzheng Pan Aug. 1993 22 p
(Contract W-31-109-eng-38)
(DE94-003209; ANL/CHM/PP-80544) Avail: CASI HC A03/MF A01

Microwave discharges (2.45 GHz) have been generated in C60-containing Ar produced by flowing Ar over fullerene-containing soot. Optical spectroscopy shows that the spectrum is dominated by the d(sup 3)(Pi)g-a(sup 3)(Pi)u Swan bands of C2 and particularly the (Delta)v = -2, -1, 0, +1, and +2 sequences. These results give direct evidence that C2 is one of the products of C60 fragmentation brought about, at least in part, by collisionally induced dissociation (CID). C60 has been used as a precursor in a plasma-enhanced chemical vapor deposition (PECVD) experiment to grow diamond-thin films. The films, grown in an Ar/H2 gas mixture (0.14% carbon content, 100 Torr, 20 sccm Ar, 4 sccm H2, 1500 W, 850 C substrate temperature), were characterized with SEM, XRD, and Raman spectroscopy. Growth rate was found to be approximately 0.6 (mu)/hr. Assuming a linear dependence on carbon concentration, a growth rate at least six times higher than commonly observed using methane as a precursor, would be predicted at a carbon content of 1% based on C60. Energetic and mechanistic arguments are advanced to rationalize this result based on C2 as the growth species. DOE

FORMATION OF THREE TYPES OF QUASI-CRYSTALS IN Al-Pd-Mg SYSTEM
Naokiyo Koshikawa, Keiichi Edagawa, Yuko Honda, and Shin Takeuchi Apr. 1993 18 p
(ISSN 0082-4798)
(Rept-A-2667; JTN-94-80538) Avail: CASI HC A03/MF A01

In the Al-Pd-Mg system, a Mackay-Icosahedron (MI) type Icosahedral (I) phase with the F-type superlattice order and a Decagonal (D) phase were found to form in a melt-quenched state, in addition to the Frank-Kasper (FK) type stable I-phase reported previously. This is the first example in which the three types of quasi-crystalline phases are formed in the same alloy system. The formation range of the FK-type I-phase in melt-quenched state is rather wide: 5 - 20 at percent Pd and 20 - 45 at percent Mg. In contrast, the MI-type, I-phase and D-phase are formed in small composition ranges around Al52Pd31Mg17 and Al74Pd21Mg5, respectively. Electron diffraction studies showed that the period along the tenfold axis of the D-phase is about 1.6 nm. The formation and stability of the MI-type and FK-type I-phases were discussed in terms of a Hume-Rothery rule. Author (NASDA)

PHASE DIAGRAM OF La2NiO(4+DELTA) (0 LESS THAN OR EQUAL TO DELTA LESS THAN OR EQUAL TO 0.18). 1: PHASES AT ROOM TEMPERATURE AND PHASE TRANSITION ABOVE DELTA EQUAL TO 0.15
Hiroyasu Tamura, Akihiko Hayashi, and Yutaka Ueda Mar. 1993 21 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan and Ogasawara Foundation for the Promotion of Science and Engineering, Japan
(ISSN 0082-4798)
(Rept-A-2661; JTN-94-80532) Avail: CASI HC A03/MF A01

La2NiO(4+delta) was prepared in the range of 0.00 less than or equal to delta less than or equal to 0.18. Oxygen stoichiometry, structure and phase transition were studied by TG-DTA (Thermogravimetric and Differential Thermal Analysis) and powder X-ray diffraction measurements. Five phases, orthorhombic Bmab (delta = 0.00), pseudo-tetragonal (delta = 0.02), orthorhombic (0.05 less than delta less than 0.09), tetragonal I4/mmm (0.1 less than delta less than 0.15) and orthorhombic Fmmm (delta greater than or equal to 0.15), appear in sequence of delta with intervals of coexistence range at room temperature. The orthorhombic phase (Fmmm) shows a first-order phase transition to a tetragonal phase (I4/mmm) with elevating transition temperatures from 320 K for delta = 0.15 to 430 K for delta = 0.18. A tentative phase diagram of La2NiO(4+delta) is also shown. Author (NASDA)

DETERMINATION OF SURFACE RECOMBINATION VELOCITY AND BULK LIFETIME IN DETECTOR GRADE SILICON AND GERMANIUM CRYSTALS
N. Derhacobian, P. Fine, J. T. Walton, Y. K. Wong, C. S. Rossington, and P. N. Luke Oct. 1993 5 p Presented at the Nuclear Science Symposium, San Francisco, CA, 2-5 Nov. 1993
(Contract DE-AC03-76SF-00098)
(DE94-003886; LBL-34022; CONF-931107-17) Avail: CASI HC A01/MF A01

Utility of a noncontact photoconductive decay (PCD) technique is demonstrated in measuring bulk lifetime, tau(sub B), and surface recombination velocity, S, in detector grade silicon and germanium crystals. We show that the simple analytical equations which relate the observed effective lifetimes in PCD transients to tau(sub B) and S have a limited range of applicability. The noncontact PCD technique is used to determine the effect of several surface treatments on the observed effective lifetimes in Si and Ge. A degradation of the effective lifetime in Si is reported as result of the growth of a thin layer of native oxide at room temperature under atmospheric conditions. DOE

Se EXAFS STUDY OF THE ELEVATED WURTZITE TO ROCK SALT STRUCTURAL PHASE TRANSITION IN CdSe NANOCRYSTALS
S. H. Tolbert (California Univ., Berkeley.) and A. P. Alivisatos (California Univ., Berkeley.) Sep. 1993 12 p Presented at the North Atlantic Treaty Organization (NATO) Advanced Study Meeting of Institute on Nanophas Materials, Corfu, Greece, 20 Jun. - 2 Jul. 1993
(Contract DE-AC03-76SF-00098)
(DE94-003247; LBL-34763; CONF-9306223-2) Avail: CASI HC A03/MF A01

High pressure Se EXAFS data has been obtained on 2.7 nm radius CdSe semiconductor nanocrystals. This system is observed to undergo a solid-solid phase transition at 6.5 GPa which is approximately twice the reported value for bulk CdSe. In combination with high pressure optical absorption experiments, EXAFS data can be used to identify the high-pressure phase structure as rock salt. EXAFS data can be fit with equations of state to yield pressure volume curves. Resultant values of bulk modulus and its derivative with respect to pressure are B(sub o) = 37 +/- 5 GPa and B(sub o)' = 11 +/- 3. A thermodynamic model for the data is presented in which the internal energy in each phase is modified by a surface energy term. Differences in surface energy are used to explain the elevation in phase transition pressure. The model can be used to estimate a value for the surface energy in the rock salt phase; 1.9 +/- 0.3 N/m is obtained in comparison to 0.9 +/- 0. 1 N/m for the wurtzite phase. DOE

(DE94-001133; CONF-9308122-12) Avail: CASI HC A02/MF A01

In order to make good quality economical diamond electronic devices, it is essential to grow films and to dope these films to obtain n- and p-type conductivity. This review discusses doping by ion implantation and the production of large area single crystal diamonds. The C implantation damage below an estimated Frenkel defect concentration of 7% could be recovered by annealing at 950 C. For a defect concentration between 7 and 10%, a stable damage form of diamond ('green diamond') was formed by annealing. At still higher damage levels, the diamond graphitized. To introduce p-type doping, we have co-implanted B and C into natural diamond at 77K, followed with annealing up to 1100 C. The resulting semiconducting material has electrical properties similar to those of natural B-doped diamond. To create n-type diamond, we have implanted Na(+), P(+), and As(+) ions and have observed semiconducting behavior. This has been compared with carbon or noble element implantation in an attempt to isolate the effect of radiation damage. Recently, in order to obtain large area signal crystals, we have developed a novel technique for removing thin layers of diamond from bulk or homoepitaxial films. This method consists of ion implantation, followed by selective etching. High energy (4-5 MeV) implantation of carbon or oxygen ions creates a well-defined layer of damaged diamond buried at a controlled depth. This layer is graphitized and selectivity etched either by heating at 550 C in an oxygen ambient or by electrolysis. This process successfully lifts off the diamond plate above the graphite layer. The lift-off method, combined with well-established homoepitaxial growth processes, has potential for fabrication of large area single-crystal diamond sheets. DOE

The Advanced Photon Source will be the brightest source of synchrotron x-rays when it becomes operational in 1996. During normal operation, the ring will be filled with 20 bunches of positrons with an interbunch spacing of 177 ns and a bunch width of 119 ps. To perform experiments with x-rays generated by positrons on these time scales one needs extremely high speed detectors. To achieve the necessary high speed we are developing MBE-grown CdTe-base photoconductive position sensitive array detectors. The arrays fabricated have 64 pixels with a gap of 100 microns between pixels. The high speed response of the devices was tested using a short pulse laser. X-ray static measurements were performed using an x-ray tube and synchrotron radiation to study the device's response to flux and wavelength changes. This paper presents the response of the devices to some of these tests and discusses different physics aspects to be considered when designing high speed detectors. DOE

OXYGEN REDUCTION AT A YSZ INTERFACE WITH CATHODE MATERIALS La(1-x)(Ca OR Sr)(x)MnO3(1-x)CaMnO3
G. E. Youngblood, C. F. Windisch, Jr., and J. L. Bates Sep. 1993 7 p Presented at the 14th International Symposium on Materials Science, Roskilde, Denmark, 6-10 Sep. 1993
(Contract DE-AC06-76RL-01830)
(DE94-002954; PNL-SA-22654; CONF-9309106-2) Avail: CASI HC A02/MF A01

Impedance spectroscopy combined with an unbonded interface cell (UIC) design, was used to assess oxygen reduction at an yttria-stabilized zirconia electrolyte interface with several substituted yttrium and lanthanum manganite cathode compositions. By analyzing impedance spectra taken using the UIC, the effective length of the reaction zone at the solid-gas triple phase boundary can be estimated and used to normalize the oxygen reduction reaction rate for each cell, thus effectively removing the effects of interface morphology. Intrinsic reaction rates (specific oxygen activities) were determined from spectra as function of temperature and oxygen partial pressure for cathodes La(1-x)(Ca or Sr)(x)(x)MnO3 and Y(1-x)Ca(x)MnO3 (LCM, LSM, and YCM, respectively) and for Pt. Specific activities in the temperature and P(O2) ranges of an operating solid oxide fuel cell (SOFC) cathode, 1173-1273 K and 10(exp 5)-10(exp 3) Pa, were highest for LCM intermediate for YCM and lowest for LSM. For LCM and YCM, compositions with x = 0.5 gave highest specific activities. Specific activities for all of the tested manganite compositions exceeded the platinum specific activities by at least an order of magnitude. Shapes of impedance spectra for all the manganite systems were similar. Examination of spectra shapes revealed that the overall cathodic polarization process was rather complex and made up of at least two or more fundamental steps. DOE

CRYSTAL POTENTIAL RETRIEVAL IN HRTEM
M. J. Beeching and A. E. C. Spargo 1993 12 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601883; UM-P-93/10) Avail: CASI HC A03 (US Sales Only)

A possible method for obtaining the crystal potential by inversion of the complex wave-field at the exit surface of the specimen, based on reversal of the multi-slice algorithm, is outlined. Results from preliminary testing of the method using computer simulated data are presented and appear promising, although the limits of applicability of the method are yet to be defined. DOE

(Contract N00014-93-1-0827)
(AD-A274854; Rept-92129712) Avail: CASI HC A03/MF A01

During this reporting period, we have made significant strides towards the program goals. A major breakthrough was made in the development of a new strained layer p-type InGaAs/InAlAs QWIP grown on InP by MBE. This new QWIP achieved an ultra-low dark current and a very high detectivity at 8.1 micrometers and 77 K. This detector is under background limited performance (BLIP) at temperatures up to 100 K, which is the highest BLIP temperature reported for a QWIP. A dark current density of 7 x 1O(exp -8) A/sq cm and a BLIP detectivity of 5.9 x 10(exp 10) Jones were measured for this QWIP at 77 K. Currently, we are investigating other possible p-type QWIP structures with different performance parameters. These include the design and fabrication of a GaAs/InGaAs p-type QWIP grown on GaAs via MBE and a new dual strained InGaAs/InAlAs p-type QWIP. Additional consideration is being given towards the reliability of p-type contacts for these QWIP structures. DTIC

STUDY OF THE HOMOGENEITY OF InP WAFERS Final Report, 15 Jul. 1991 - 14 Jul. 1993
J. Jimenez, P. Martin, and M. Avella Jul. 1993 79 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0278-91)
(AD-A273658; EOARD-TR-94-01) Avail: CASI HC A05

The homogeneity of InP substrate at both microscope and microscopic scale has been studied by Raman microprobe and photocurrent mapping. Raman microprobe was used for any type of substrate revealing different structural and electronic properties of different extended defects. This study was correlated with photoetching and a relationship between revealed defects and Raman features was established. Semi-insulating substrates were analyzed by photocurrent mapping. Three excitation wavelengths were used revealing different sources of non-uniformity in these wafers. The technique is shown to be quite sensitive to electrical non- homogeneities concerning the iron distribution across the wafer. DTIC

STRESS RELAXATION IN SPUTTERED W FILMS AND W/GeSi/Si HETEROSTRUCTURES
F. M. Ross, R. R. Kola (Bell Telephone Labs., Inc., Murray Hill, NJ.), R. Hull (Bell Telephone Labs., Inc., Murray Hill, NJ.), and J. C. Bean (Bell Telephone Labs., Inc., Murray Hill, NJ.) Nov. 1993 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC03-76SF-00098)
(DE94-004007; LBL-34856; CONF-931108-11) Avail: CASI HC A02/MF A01

Stress relaxation was investigated in GeSi/Si heterostructures on which thin W films have been sputtered with different stress states. Real-time electron microscope observations of the relaxation process demonstrate that the presence of the stressed metal film changes the relaxation kinetics of the GeSi/Si heterostructures. The significance of this result is discussed for the processing of strained layer heterostructures into devices. The relationship between microstructure and stress in these sputtered W films is discussed, and, by developing a novel specimen geometry for the transmission electron microscope (TEM), dynamic observations are made of the evolution of microstructure and stress during the beta-W yields alpha-W transformation. DOE

THE EFFECT OF PROCESSING ON THE MICROSTRUCTURE OF Ag-SHEATHED Bi-2223 WIRES
D. J. Miller, J. G. Hu, P. Kostic, U. Balachandran, and P. Haldar (Intermagnetics General Corp., Guilderland, NY.) Nov. 1993 12 p Presented at the Fall Meeting of the Minerals, Metals and Materials Society: Physical Metallurgy and Materials, Pittsburgh, PA, 17-21 Oct. 1993
(Contract W-31-109-eng-38)
(DE94-004627; ANL/MSD/CP-81484; CONF-931009-15) Avail: CASI HC A03/MF A01

Studies using TEM and SEM focused on effect of final heat treatment conditions on microstructure of (Bi,Pb)2Sr2Ca2Cu3O(x) (Bi-2223) wires and corresponding variations in critical currents I(sub c). It is found that variations in I(sub c) for segments cut from various points along length of a wire can be correlated with variations in volume fraction and nature of second phases. Similar variations are observed between wires processed under different final annealing conditions. A common feature found in all of the wire segments with lower I(sub c) values was presence of the Pb3Sr2Ca2CuO(x) phase (Pb-3221). Microchemical analysis suggests that formation of this phase leads to variations in composition of Bi-2223 grains. As a result, the wires which exhibit the Pb-3221 phase consist of an assemblage of grains with a range of transition temperatures based on composition. Thus, in these segments, the current carrying capacity of individual grains at 77K varies from very good to poor, and a significant reduction in the overall I(sub c) of the segment is observed. DOE

STUDIES OF THIN-FILM GROWTH, ADSORPTION, AND OXIDATION BY IN SITU, REAL-TIME, AND EX SITU ION BEAM ANALYSIS
Y. Lin, A. R. Krauss, D. M. Gruen, and Y. Nishino 1993 25 p Presented at the 40th National Symposium of the American Vacuum Society, Orlando, FL, 15-19 Nov. 1993

(Contract W-31-109-eng-38)
(DE94-002907; ANL/CHM/CP-81119; CONF-9311104-8) Avail: CASI HC A03/MF A01

We have developed a time-of-flight (TOF) ion scattering and direct recoil spectrometer (ISS/DRS) to study the surface composition and reconstruction of metals, metal-oxides, and semiconductors, and to provide in situ characterization of the thin-film deposition process. In situ, real-time study of Pb, Zr, and Ru ultrathin films produced by ion beam sputter deposition is presented as a demonstration of pulsed ion beam surface analysis (PIBSA) as a means of characterizing monolayer and submonolayer growth, both in UHV and in mTorr oxygen background. The capability of performing surface analysis at pressures greater than 10(exp -3) Torr is unique to pulsed ion beam surface analysis among surface analytical methods and enables the in situ monitoring of oxide thin-film growth processes and surface-gas phase reactions. Using angular-resolved ISS (ARISS), combined with Auger electron spectroscopy (AES), we studied the oxygen adsorption and reconstruction of (001) oriented InSb thin-film surfaces. It was found that the adsorption of molecular oxygen on the InSb (001) surface is consistent with the Langmuir model. Oxygen adsorption preferentially occurs on the antimony sites corresponding to the extension of the lattice into the vacuum and reduces the inward contraction of the first two layers of the clean InSb (001) surface relative to the bulk atomic spacing. MBE GROWN 3 TO 5 STRAIN RELAXED BUFFER LAYERS AND SUPERLATTICES CHARACTERIZED BY ATOMIC FORCE MICROSCOPY
A. J. Howard, I. J. Fritz, T. J. Drummond, J. A. Olsen, B. E. Hammons, S. R. Kurtz, and T. M. Brennan 1993 20 p Presented at the 40th National Symposium of the American Vacuum Society, Orlando, FL, 15-19 Nov. 1993
(Contract DE-AC04-94AL-85000)
(DE94-002931; SAND-93-1126C; CONF-9311104-12) Avail: CASI HC A03/MF A01

Using atomic force microscopy (AFM), the authors have investigated the effects of growth temperature and dopant incorporation on the surface morphology of MBE grown graded buffer layers and strained layer superlattices (SLS's) in the InGaAlAs/GaAs and InAsSb/InSb material systems. The AFM results show quantitatively that over the temperature range from 380 to 545 C, graded In(x)Al(1-x)As (x = 0.05 - 0.32) buffer layers grown at high temperatures (approximately 520 C), and graded In(x)Ga(1-x)As (x = 0.05 - 0.33) buffer layers and In(0.4)Ga(0.6)As/In(0.26)Al(0.35)Ga(0.39)As SLS's grown at low temperatures (approximately 400 C) have the lowest RMS roughness. Also, for SLS's InAs(0.21)Sb(0.79)/InSb, undoped layers grown at 470 C were smoother than undoped layers grown at 420 C and Be-doped layers grown at 470 C. These results illustrate the role of surface tension in the growth of strained layer materials near the melting temperature of the InAs(x)Sb(1-x)/InSb superlattice. Nomarski interference and transmission electron microscopies, IR photoluminescence, x-ray diffraction, and photocurrent spectroscopy were also used to evaluate the relative quality of the material but usually, the results were not conclusive. THE EPITAXIAL GROWTH OF Ge ON Si(100) USING Te AS A SURFACTANT
X. Yang, J. Wu, R. Cao, J. Terry, P. Pianetta, and J.-S. Li (Stanford Univ., CA.) Oct. 1993 6 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 12-16 Apr. 1993
(Contract DE-AC03-76SF-00515)
(DE94-003437; SU-SLAC-PUB-6300; SLAC/SSRL-0041; CONF-930405-51)
Avail: CASI HC A02/MF A01

Epitaxial growth of Ge on Si using Te as a surfactant was studied with high resolution photoemission, low energy electron diffraction, and cross-sectional transmission electron microscopy. The growth mode of Ge on Si changed from Stranski-Krastanov to layer-by-layer mode when 1/4 ML Te atoms were on the surface. During the growth, Te atoms segregated to the top of the surface. If the growth temperature is too high, above approximately 450 C, the Te coverage was less than the necessary coverage to keep the layer by layer growth, and the growth mode of Ge on Si is still S-K. DOE

ORDERING AND PHASE SEPARATION IN MOCVD InGaP ALLOYS AND UNICOMPOSITIONAL QUANTUM WELLS
D. M. Follstaedt, R. P. Schneider, Jr., and E. D. Jones 1993 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC04-94AL-85000)
(DE94-004693; SAND-93-1493C; CONF-931108-24) Avail: CASI HC A02/MF A01

The microstructures of In(0.5)Ga(0.5)P alloys grown on (100) GaAs by MOVPE have been characterized with cross-section TEM and their optical emission examined with photoluminescence at low temperatures. All the alloys exhibit spinodal-like decomposition with compositional modulations along directions in the growth plane. Alloys grown at 775 C have the highest emission energy, 2.0 eV, while those at 675 C have the lowest, 1.89 eV, due to strong CuPt-type ordering of In and Ga. The ordered domains are platelets 20 to 200 nm wide and 10-20 nm thick with antiphase boundaries 1-2 nm apart. We have also formed 'unicompositional' quantum wells of thin (1.3-20 nm) ordered layers grown at 675 C between disordered barriers grown at 775 C. Ordering is found only in the active layer, with domains similar to those of thick layers. The emission energy increases by 90 meV as the well thickness is decreased from 10 to 1.3 nm, thus demonstrating quantum size effects solely through disorder-order phenomena. DOE

POLAR AND CHEMICAL DOMAIN STRUCTURES OF LEAD SCANDIUM TANTALATE (PST)
J. L. Peng and L. A. Bursill 1993 18 p
(DE94-600760; UM-P-93/25) Avail: CASI HC A03/MF A01 (US Sales Only)

The local structure of chemical and polar domains and domain walls is determined directly by atomic resolution high-resolution electron microscopy. Thus, the Pb, Ta, and Sc atomic positions may be located in the images of very thin crystals. Furthermore, the Pb cation displacements away from the ideal perovskite A-site have been measured directly for the first time. Local variations in polarization direction may be mapped directly off the images, provided certain electron optical conditions are met. Results are relevant to recent theories of polar-glass behavior in relaxor-type complex oxide functional ceramics. DOE

REGROWTH ZONES IN LASER ANNEALED RADIATION DAMAGED DIAMOND
D. N. Jamieson, S. Prawer, S. P. Dooley, and R. Kalish (Technion - Israel Inst. of Tech., Haifa.) 1993 21 p Presented at the 3rd International Conference on Nuclear Microprobe Technology and Applications, Uppsala, Sweden, 8-12 Jan. 1992
(DE94-600821; UM-P-92/74; CONF-9201160) Avail: CASI HC A03/MF A01 (US Sales Only)

Focused laser annealing of ion implanted diamond with a 15 micron diameter laser spot produces as variety of effects that depend on the power density of the laser. Channeling Contrast Microscopy (CCM) provides a relatively straight forward, rapid, method to analyze the annealed regions of the diamond to characterize the effects. In order of increasing laser power density, effects that are observed include: regrowth of the end of range damage of the ion implantation, formation of a buried graphitic layer, and complete graphitization of the surface of the diamond down to the bottom of the original damage layer. Information provided by CCM leads to an understanding the causes of these effects and provides insight into the carbon phase diagram in the neighborhood of the graphite to diamond phase transition. Analysis of the effects of laser annealing by CCM are complicated by the swelling of the diamond lattice caused by the original ion implantation, compaction following regrowth, and the effect of the analysis beam irradiation itself. Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634326; IC-93/95) Avail: CASI HC A03 (US Sales Only)

Propagation of hypersound in a semiconductor superlattice (SL) in the presence of an external electric field of the form E = E(sub 0) + E(sub 1) cos(omega)t has been studied theoretically. The analytical expressions obtained for the absorption coefficient, gamma, are presented graphically. It is observed that in the absence of a.c. electric field the dependence of gamma on E(sub 0) is nonlinear unlike the homogeneous bulk material where the dependence of gamma on E(sub 0) is linear. The inclusion of a.c. electric field affects the elation gamma on E(sub 0) depending on the values of E(sub 1) and omega(tau). For a given E(sub 1), the peaks of the curve gamma(sub 0) on E(sub 0) decrease, shift and eventually oscillate for increasing values of omega(tau) i.e. from omega(tau) much less than 1 to omega(tau) much greater than 1. MULTI-CHANNEL KONDO NECKLACE
P. Fazekas and Haeyoung Kee Jun. 1993 29 p
(DE93-634754; IC-93/136) Avail: CASI HC A03/MF A01 (US Sales Only)

A multi-channel generalization of Doniach's Kondo necklace model is formulated, and its phase diagram studied in the mean-field approximation. Our intention is to introduce the possible simplest model which displays some of the features expected from the overscreened Kondo lattice. The N conduction electron channels are represented by N sets of pseudospins tau(sub J), j = 1 1,..., N which are all antiferromagnetically coupled to a periodic array of modul S = 1/2 spins. Exploiting permutation symmetry in the channel index j allows us to write down the self-consistency equation for general N. For N greater than 2, we find that the critical temperature is rising with increasing Kondo interaction; we interpret this effect by pointing out that the Kondo coupling creates the composite pseudospin objects which undergo an ordering transition. The relevance of our findings to the underlying fermionic multi-channel problem is discussed. DOE

ISING CRITICAL BEHAVIOUR IN THE ONE-DIMENSIONAL FRUSTRATED QUANTUM XY MODEL
E. Granato Jun. 1993 18 p
(DE93-634755; IC-93/137) Avail: CASI HC A03/MF A01 (US Sales Only)

A generalization of the one-dimensional frustrated quantum XY model is considered in which the inter and intra-chain coupling constants of the two infinite XY (planar rotor) chains have different strengths. The model can describe the superconductor-insulator transition due to charging effects in a ladder of Josephson junctions in a magnetic field with half a flux quantum per plaquette. From a fluctuation-effective action, this transition is expected to be in the universality class of the two-dimensional classical XY-Ising model. The critical behavior is studied using a Monte Carlo transfer matrix applied to the path-integral representation of the model and a finite-size-scaling analysis of data on small system sizes. It is found that, unlike the previous studied case of equal inter- and intra-chain coupling constants, the XY and Ising-like excitations of the quantum model decouple for large interchain coupling, giving rise to pure Ising model critical behavior for the chirality order parameter in good agreement with the results for the XY-Ising model. DEVELOPMENTS IN CRYSTALLOGRAPHIC PHASE ANALYSIS IN THE SEM: BACKSCATTERED ELECTRON KIKUCHI PATTERNS
J. R. Michael, R. P. Goehner, and C. R. Hills 1993 3 p Presented at the 2nd Interamerican Congress on Electron Microscopy, Cancun, Mexico, 26 Sep. - 2 Oct. 1993
(Contract DE-AC04-76DP-00789)
(DE93-040755; SAND-93-1808C; CONF-9309241-1) Avail: CASI HC A01/MF A01

The recent development of a charge coupled device (CCD)-based detector for the acquisition of backscattered electron Kikuchi patterns has enabled on-line crystallographic phase identification studies to be conducted in the scanning electron microscope. High quality patterns have been obtained from a wide variety of materials with relatively little specimen preparation compared to electron diffraction in the transmission electron microscope (TEM). Crystallographic phase identification through a combination of BEKP and energy dispersive x-ray spectrometry is demonstrated by the identification of precipitates in a high temperature Ni-based alloy containing Cr and W. The precipitates that formed in this alloy were identified as M6C or M23C6. DOE

(DE93-634761; JINR-R-8-92-223) Avail: CASI HC A02 (US Sales Only)

The influence of time factor on energy losses of a NbTi multifilamentary superconductor in a pulsed magnetic field was investigated. The observed decrease of eddy current losses by a factor of 1.4-3.4 is probably associated with increasing an effective transverse resistivity of the matrix due to diffusion between NbTi and copper. Processes of obsolescence did not result in decreasing current-carrying capability. DOE

New metals and alloys (M&A) indexes to the Powder Diffraction File (PDF) were developed. All index data were critically reviewed, and the organization, selection of materials, and use of alphabetical formulae are similar to those of Villars and Calvert. The book contains four indexes. The Permuted-Sort Alphabetical Formula Index collects all entries containing a given element in alphabetical formula order. Within phase diagrams, phases are listed in compositional order. The Structure Type Index has entries arranged in Pearson symbol order. Hence, one can easily find all the materials with a given structure. The Common Names Index links common metallurgical names to PDF data. The Strukturbericht Symbol Index links Strukturbericht symbols to the equivalent Pearson symbols and prototype structures. DOE

SUBMILLIMETER RESIDUAL LOSSES IN HIGH-(Tc) SUPERCONDUCTORS Ph.D. Thesis

D. Miller Sep. 1993 156 p
(Contract DE-AC03-76SF-00098)
(DE94-003241; LBL-34665) Avail: CASI HC A08/MF A02

Bolometry was used to obtain accurate submillimeter residual loss data for epitaxial films of YBa2Cu3O7 (YBCO), Tl2Ca2Ba2Cu3O10, Tl2CaBa2Cu2O8 (TCBCO), and Ba(0.6)K(0.4)BiO3 (BKBO). The absorptivity measured for Nb films was fit to an Eliashberg strong coupling calculation; excellent agreement resulted between parameters from best fits and measured Residual Resistivity Ratio. Microwave surface resistance measurements made on the same YBCO and TCBCO films are in excellent agreement with submillimeter measurements. Absorptivities for all YBCO films studied are qualitatively similar, increasing smoothly with frequency, with no gap-like features below the well known absorption edge at 450 cm(sup -1). Losses in YBCO films were fit to a weakly coupled grain model for the a-b plane conductivity. Strong phonon structure was observed in TCBCO films between 60 and 700 cm(sup -1) (2 THz and 23 THz); these losses could not be fitted to the simple weakly coupled grain model, in contrast to the case for other high-(T(sub c)) superconductors where phonon structure observed in ceramics is absent in epitaxial oriented films and crystals because of electronic screening due to high conductivity of a-b planes. Absorptivity data for the BKBO films all show a strong absorption onset near the BCS tunneling gap of 3.5 k(sub B)(T(sub c)). Comparison with strong coupling Eliashberg predictions and of a Kramers-Kronig analysis indicate that the absorption onset is consistent with a superconducting energy gap. Effects of magnetic field on residual losses in YBCO films show a resonant absorption feature in vicinity of predicted. DOE

TRANSLATIONAL-ENERGY-RESOLVED STUDIES OF PHOTOGENERATED CARRIER-INDUCED REACTIONS ON UHV SEMICONDUCTOR SURFACES

R. M. Osgood, Jr. 1993 28 p
(Contract DE-FG02-90ER-14104)
(DE94-004169; DOE/ER-14104/4) Avail: CASI HC A03/MF A01

The central phenomena of adsorbate photochemistry of semiconductor-adsorbate interfaces was observed and understood. In particular, it was observed that a major channel of photochemistry on a semiconductor surface is through the transfer of photoexcited substrate electrons to the adsorbed molecules. In contrast, photochemical processes by direct intra-adsorbate excitation are largely quenched for molecules in direct contact with the surface. The electron-transfer mediated process leads to both desorption and intra-adsorbate bond cleavage. The transfer may be by hot electrons or thermalized electrons in the conduction band. Dynamics of the electron-transfer reaction vary greatly for molecules in the first and second layer and for molecules of different orientations in the first layer. While molecules in the second layer can be dissociated only through the transfer of hot electrons or direct photon bond cleavage, those in the first layer react by thermalized electrons as well as hot electrons, depending on the orientation of the molecules. The two processes are differentiated experimentally by the different characteristic energy and angular distribution of the photofragments. In addition, it was discovered that reaction self-quenching can be an important process in thermalized electron-induced reactions on semiconductor surfaces. This behavior stems from effects on lifetime of the thermalized carriers by reaction products left on the surface. Finally, importance of electron-transfer-induced reactions at surfaces arises in part from shift in lowering of unoccupied electronic orbitals of adsorbates in image region of semiconductor surfaces. This latter effect is also largely responsible for a red shift observed for photochemical processes on surfaces. DOE

MAGNETOSTRICTION AND MAGNETOSTRICTIVE MATERIALS [MAGNETOSTRIKTIIVISYYS JA MAGNETOSTRIKTIIVISET MATERIAALIT]

Pekka Ruuskanen Dec. 1992 50 p In FINNISH
(ISSN 1235-0605)
(VTT-TIED-1434; ISBN-951-38-4328-9; ETN-94-95261) Copyright Avail: CASI HC A03/MF A01

When ferromagnetic material is under the influence of a stress the magnetization of the material is observed to change. This phenomenon is called magnetostriction. Magnetostriction is defined as a relation lambda = (Delta 1)/1. Here 1 is the initial length of the material and Delta 1 is the increase in the length caused by the magnetic field. All the theories of magnetostriction are based on the experimental results and there is no common theory which could explain all the properties of magnetostriction. Also the internal magnetization of ferromagnetic material is not understood in details. Magnetostriction can be exploited in many industrial applications like transducers, motors and measuring equipments. In high frequency applications magnetostriction causes energy losses. In these cases low magnetostrictive materials have to be used. ESA

MICROSTRUCTURES OF SI SURFACE LAYERS IMPLANTED WITH Cu

D. M. Follstaedt and S. M. Myers 1993 7 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC04-94AL-85000)
(DE94-004690; SAND-93-1471C; CONF-931108-26) Avail: CASI HC A02/MF A01

Microstructures of Si ion-implanted with Cu have been characterized by TEM after annealing. For 1.2 at.%, the Cu is trapped at planar defects, but for 10 at.%, (eta)-Cu3Si forms and Cu diffuses at its equilibrium solubility. These observations allow proper evaluation of the binding energies of Cu to previously formed internal cavities (2.2 eV) and (eta)-Cu3Si (1.7 eV). The 10 at.% Cu layer promotes oxidation of Si catalyzed by (eta)-Cu3Si. The microstructures also indicate that Si implanted with (approximately)2 at.% Cu reforms epitaxially with embedded defects after 8 hr at 700C, but for (approximately)10 at.% Cu, epitaxy is not recovered after 6 hours at 600C. DEMONSTRATION OF MONOLITHIC CO-FABRICATION OF Y1Ba2Cu3O7-SIGMA AND CMOS DEVICES ON THE SAME SAPPHIRE SUBSTRATE
P. R. DeLaHoussaye, M. J. Burns, W. S. Ruby, S. D. Russell, and S. R. Clayton Oct. 1993 4 p
(AD-A274757) Avail: CASI HC A01/MF A01

This paper reports the first fabrication of active semiconductor and high temperature superconducting (HTS) devices on the same substrate. Complementary Metal-Oxide-Semiconductor (CMOS) transistors were fabricated on the same sapphire substrate as either YBCO flux-flow transistors (FFT's) or YBCO superconducting quantum interference devices (SQUID's). All devices functioned as expected at 77 K without degradation demonstrating that a compatible process has been found to monolithically integrate adjacent CMOS and HTS devices. DTIC

OCTAHEDRAL METALLOMESOGENS: LIQUID CRYSTALLINITY IN LOW ASPECT RATIO MATERIALS
Hanxing Zheng and Timothy M. Swager 8 Jan. 1994 3 p
(Contract N00014-92-J-1416)
(AD-A274830; TR-5) Avail: CASI HC A01/MF A01

A new class of metallomesogens with octahedral structures are described. The observation of liquid crystallinity in these materials was unexpected as a result of their low aspect ratios. To better understand these materials, the dependence of the mesomorphism upon the number of sidechains (N) and metal center (Fe, Mn, Cr) was investigated. Complexes of Fe (N=6) appear to exhibit a highly ordered smectic phase. However, all of the complexes investigated with N= 12, 15, and 18 display columnar mesomorphism. Columnar phases with hexagonal and rectangular symmetry were observed which display optical textures similar to known discotic phases. In addition it was found that the conformational preferences of the alkoxyphenyl groups attached to the 1,3-diketone ligands are coupled to the stability of different phases. Although these phases show textural and structural similarities with known discotic columnar phases, they are not miscible with discotic compounds having similar lattice parameters and regions of mesomorphism. It is proposed that the octahedral complexes exhibit clefts necessary to accommodate sidechains which can not be directed outside the columns core. As a result of the differences from regular discotics, these new columnar phases have been labeled as octahedral hexagonal O(h) and octahedral rectangular O(r). DTIC

MODULATION WAVELENGTH DEPENDENCE OF ION MIXING IN METALLIC SUPERLATTICES
Dale E. Alexander, Eric E. Fullerton, P. M. Baldo, C. H. Sowers, and L. E. Rehn Nov. 1993 7 p Presented at the Fall Meeting of the Materials Research Society, Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract W-31-109-eng-38)
(DE94-004608; ANL/MSD/CP-80134; CONF-931108-16) Avail: CASI HC A02/MF A01

Ion mixing was studied in polycrystalline Nb/V and single-crystal Mo/V superlattices and in bilayers of the same materials. Systematic variation in the modulation wavelength, Lambda, revealed a factor of three decrease in mixing efficiency at small Lambda for Nb/V. The decrease appears to coincide with a structural transition in which the Nb/V superlattices become coherent. The results are consistent with a diffusion-induced grain boundary migration interpretation of mixing during irradiation. DOE

MODELING GROUP 4 ELEMENTS WITH NEW TRANSFERABLE TIGHT-BINDING MODELS
I. Kwon and R. Biswas (Iowa State Univ. of Science and Technology, Ames.) 1993 4 p Presented at the Interatomic Potentials for Large-Scale Simulations of Non-Equilibrium Phenomena in SiC Meeting, Santa Barbara, CA, 15-17 Aug. 1993
(Contract W-7405-eng-36)
(DE94-000770; LA-UR-93-3359; CONF-9308182-1) Avail: CASI HC A01/MF A01

An outstanding problem in the computer-based microscopic description of Group IV materials is the need for an accurate transferable model of the energetic and electronic properties of semiconductor structures. The three complementary approaches were the ab-initio method including Car-Parinello simulations, the classical molecular dynamics method, and tight-binding molecular dynamics. While being very accurate, the ab-initio molecular dynamics was performed on small systems (approximately 100 atoms) for short time scales (approximately 10 ps). On the other hand, classical potential models had much success in describing melting of silicon, amorphous silicon structures, thin film growth and a variety of computationally intensive molecular dynamics simulations. However, the classical based models do not contain important electronic information which is essential in a variety of problems in electronic materials such as determining the gap states for structural defects. The accuracy of the classical models in configurations, far from the fitting database, may be uncertain. Our approach is to find transferable tight-binding models for silicon that are in between the ab-initio simulations and the classical models for molecular dynamics in level of sophistication. DOE

The design, fabrication, and operation of GaAs cermet- and capacitive-gate charge coupled devices (CCD's) are described. Performance tradeoffs in the design of GaAs CCD's for signal processing applications are evaluated in terms of physical design parameters (mark/space ratio) and substrate material specifications. An in-depth examination of the influence of the cermet-gate structure on device performance is provided. The incorporation of this structure has been shown to improve the charge transfer efficiency and dynamic range of the CCD, thereby extending the bandwidth and range of useful operation of these devices. Experimental characterization of the charge transfer efficiency and dynamic range has been performed at clock frequencies up to 1 GHz, the upper limit being imposed by available test circuitry. These devices exhibit transfer efficiency in excess of 0.996 at 1 GHz with a sensitivity of -30 dBm and approximately 40 dB of dynamic range. The demonstration of fair performance of a cermet-gate CCD fabricated on a metal semiconductor field effect transistor (MESFET) compatible substrate indicates the potential for successful monolithic integration of these devices with GaAs D-MESFET circuitry. In a 2H AlN-SiC solid solution grown by MBE on alpha(6H)-SiC (3 degrees) from (0001), the epilayer contained a high density of basal faults related to approximately 5 nm steps on the growth surface: no compositional inhomogeneity was detected by PEELS. In diffusion couples of polycrystalline, sintered AlN on SiC annealed at 1600 and 1700 degrees C. 8H sialon (nominally (AlN)2Al2O3) formed at the interface of SiC and recrystallized epitactic AlN grains, and Si3N4-rich (beta)(prime) sialon particles formed in the SiC. No interdiffusion was detected by PEELS in diffusion couples of MBE-grown AlN on SiC annealed at 1700 and 1850 degrees C. Irregular epilayer thickness explains companion Auger depth profile results. Hadlar (Intermagnetics General Corp., Guilderland, NY.) 1993 5 p Presented at the 6th International Symposium on Superconductivity, Hiroshima, Japan, 26-29 Oct. 1993
(Contract DE-AC02-76CH-00016)
(DE94-003009; BNL-49652; CONF-931073-3) Avail: CASI HC A01/MF A01

Detailed measurements of the V-I curves for a number of Bi2Sr2CaCu2O8 and Bi2Sr2Ca2Cu3O10/Ag composite tapes were made at 4.2, 27, and 64-77 K as a function of applied magnetic field as well as the angle between the tape face and the direction of applied field. Results suggest that the weak vortex-pinning strength and the amount of the weakly coupled grain boundaries and of the non-superconducting volume are the primary limiting factors for critical current densities in Bi(2212)/Ag and Bi(2223)/Ag, respectively. Furthermore, in both cases, the dissipative voltages arise from the interior of the gains. DOE

Grain boundary diffusion coefficients of Co-57 and Co-59 in polycrys. NiO, NiO bicrystal, and polycrys. Fe3O4 were determined at various oxygen pressures at 750 C. For NiO, the low oxygen pressure region (less than 10(exp -10) MPa) displayed constant grain boundary diffusion coefficients as the oxygen pressure decreased indicating an extrinsic region in which the impurity-induced defects dominated the intrinsic defects. At greater oxygen pressures, the intrinsic defects (Ni vacancies) dominated the extrinsic defects causing the diffusion to increase with pressure. For Fe3O4, at low oxygen pressures (less than 10(exp -16) MPa), the grain boundary diffusion coefficient increased when the pressure decreased owing to interstitial type diffusion; at greater than 10(exp -15) MPa, the diffusion increased with pressure owing to vacancy type diffusion. D(sub gb) of Co ions in Fe3O4 is proportional to pO2(exp -2/3) in the low pressure region and to pO2(exp 2/3) in the high pressure region, indicating similar mechanisms in the grain boundary diffusion and volume diffusion. Ratio of D(sub gb)/D was about 10(exp 3). DOE

The artificial pinning center (APC) approach to NbTi superconductor fabrication offers the potential benefits of higher current density and lower cost than the conventional process for NbTi. We have been evaluating several approaches for fabricating NbTi via the APC approach to determine whether these advantages can be realized in a practical conductor. The study began with the fabrication by several vendors of 10kg size samples which were evaluated as short samples. This was followed by the scale-up of one process to 150mm diameter billets. This material was evaluated first in a solenoid configuration and recently in a one-meter long dipole. We will report here on the results of these coil tests and other characterization results for this new material. We will also describe the plans to continue the scale-up to full size billets and we will discuss the potential cost savings of this approach compared with conventional NbTi fabrication. DOE

Biased enhanced nucleation of diamond on beta-SiC(100) and Si(100) has been achieved but not on Cu(100). Carbide formation is an apparent attribute to the nucleation. The refractory metals of Hf, Ti, Ta, Ni, and W were thus explored as substrates. Diamond nucleation density was found to be directly related to the carbide heat of formation without scratching these substrates. TEM of highly oriented diamond films on Si(100) showed dislocations at low angle boundaries formed from coalesced grains. The azimuthal rotation between grains was between zero to six degrees. Negative electron affinity (NEA) has been found experimentally and theoretically for the two by one reconstructed diamond surface. Theoretical results indicate that the observed NEA is associated with a monohydride terminated surface, while the hydrogen-free surface exhibits a positive electron affinity. Raman and various photoluminescence (PL) techniques were used to investigate the role of N doping on the optical centers in CVD diamond films. The PL transitions attributed to the zero-phonon lines of N centers are observed at 1.945 eV and 2.154 eV. A new N center at 1.967 eV and the band A luminescence were also observed. The presence of an in-gap state distribution resulting from the sp(sup 2) disordered phase has been established. BN films have been grown on 100 oriented Si, diamond, Cu, and Ni substrates via IBAD and characterized via FTIR and HRTEM. DTIC

Monocrystalline thin films of AlN and GaN have been deposited on vicinal alpha(6H)-SiC(0001) wafers via gas-source MBE and cold-wall metalorganic (MO) CVD and extensively investigated via high-resolution TEM. Elemental metal sources combined with activated nitrogen generated using an ECR plasma were employed in the MBE system; triethylgallium, triethylaluminum and ammonia were used in the MOCVD system. The MBE research has also included n-(Si) and p-type(Mg) doping and the creation of p-n junctions. The effects on growth of T, P, and MO flux have been investigated in the MOCVD work. Below the critical thickness, AlN only contains threading dislocations emanating from the misfit dislocations; above this thickness, defects parallel to the growth surface greatly increase. The defect density of AlN grown on SiC at 1100 C is much lower than that contained in materials deposited at 700 C. Deposition of GaN on an AlN buffer layer previously deposited on sapphire or SiC results in a larger number of dislocations parallel to the growth surface. A system for the deposition of InN and its solid solutions which addresses the problems of the low decomposition pressure has also been designed. The feasibility of designing an ammonia cracker cell for the MBE system to provide an alternative source of activated nitrogen is being investigated. DTIC

Thin epitaxial films of SiC/AlN multilayers and (AlN)(x)(SiC)(1-x) solid solutions have been grown by plasma-assisted, molecular beam epitaxy between 1050 to 1300 C using the gas sources of Si2H6, C2H4, and N2, the last decomposed using a compact electron cyclotron resonance plasma source, and the solid source of Al. Vicinal alpha(6H)-SiC(0001) was used for the substrates. Electron diffraction and high resolution TEM revealed monocrystalline layers and pseudomorphic growth. Additional studies have shown that the off-axis orientation of the substrate affects the film morphology, surface cleaning is very important, and Si/C gas flow ratios may be used to control the SiC polytype. Both Beta(3C)- and alpha(6H)-SiC have been successfully deposited on alpha(6H)-SiC substrates. The chemical interdiffusion between monocrystalline AlN films and alpha(6H)-SiC wafers is also under study. The results of the successful research regarding multilayer heterostructures in the AlN/GaN system are now being used to guide the fabrication of a double heterostructure ultraviolet light emitting diode based on suitably doped AlGaN confinement layers with improved carrier confinement and mobility. Factors that control phase evolution, microstructural development, and ferroelectric domain assemblage are evaluated for chemically prepared lead zirconate titanate (PZT) thin films. Zirconium to titanium stoichiometry is shown to strongly influence microstructure. As Ti content increases, there is an apparent enhancement of the perovskite phase nucleation rate, grain size becomes smaller, and the amount of pyrochlore phase, if present, decreases. While the pyrochlore matrix microstructure for near morphotropic phase boundary composition thin films consists of two interpenetrating nanophases (pyrochlore and an amorphous phase), the pyrochlore microstructure for PZT 20/80 films deposited on MgO substrates is single phase and consists of 10nm grains. Zirconium to titanium stoichiometry also has a substantial influence on process integration. Near morphotropic phase boundary films exhibit extensive reaction with underlying TiO2 diffusion barriers; conversely, there is no chemical reaction for identically processed PZT 20/80 thin films. The authors have attempted to directly correlate the optical quality of PZT thin films to the following microstructural features: (1) presence of a second phase, (2) domain orientation, and (3) nanometer surface morphology. DOE

CALCULATION OF THE ELECTROMAGNETIC CRITICAL STATE RESPONSE OF HIGH T(SUB c) SUPERCONDUCTOR TAPE
L. S. Koo and K. L. Telschow 1993 6 p Presented at the 20th Annual Review of Progress in Quantitative Nondestructive Evaluation (NDE), Brunswick, ME, 1-6 Aug. 1993
(Contract DE-AC07-76ID-01570)
(DE94-002894; EGG-M-93127; CONF-9308167-4) Avail: CASI HC A02/MF A01

The new superconducting materials are being fabricated into long lengths in the form of thin tapes clad in silver for applications such as magnets. Variations in critical current as a function of position along the tape is a constant fabrication problem. An important nondestructive evaluation (NDE) task is to develop methods for determining critical current density with high spatial resolution along the tape in order to aid the fabrication process. Typically, critical currents are measured by contact four point voltage-current measurements. Although widely used, this technique averages results over long measurement regions, typically centimeters, and requires physical contact. An alternative method uses a probe similar to those used for eddy current measurements in normal metals to induce the critical state locally under the coil. The local critical current can be determined from the measured tape response and the critical state model. Previously, this model was developed only for experimental situations involving uniform externally applied magnetic fields. It was successfully used to predict the electromagnetic response, even as to harmonic content, of samples in slab or cylindrical geometry. Tape geometries and the need for high-resolution local measurements dictate that nonuniform external fields be used, such as those produced by small coils of only a few turns. Recently, this type of probe was used to measure critical currents as a function of position along tapes utilizing an empirical analysis of the critical state. Progress toward establishing a direct calculational method that can be used to predict the critical state response for nonuniform external fields generated by cylindrically symmetric current loops is outlined. An integral equation is developed describing the critical state that can be solved exactly in lowest order, iterated for higher precision, and that may be useful for other geometries. DOE

A self consistent pseudopotential calculation of the valence band offset (VBO) at GaAs/InAs (001) strained heterojunction, which is chosen as an example of the isovalent polar with common-anion lattice mismatched heterojunctions, is presented. The effects of strain are studied by looking at the variation of the VBO versus the inplane lattice constant, which is imposed by the substrate. Our results show that the VBO can be tuned by about 0.17 eV going from GaAs to InAs substrates. Comparison of our work with the available experimental and theoretical results is also discussed. DOE

A theory is developed of the electron density of states (DOS) in slightly compensated heavily doped semiconductors which undergo a thermal treatment. The calculation is carried out within the semiclassical approach to the random impurity field, taking adequately into account high-temperature correlation among the impurities and low temperature screening due to the free carriers as well. Then, a simple analytic expression for the DOS is obtained which exhibits the same energy dependence as in the case of a random impurity distribution, but now with some correlation-induced changes in the coefficients. A numerical estimation on non-compensated n-type sample of GaAs at a doping level of 5 x 10(exp 18) cm(sup -3) shows that in the tail region the correlated DOS turns out to be somewhat larger and cut less sharply than the random one. ATOMIC LAYER EPITAXY OF GROUP 4 MATERIALS: SURFACE PROCESSES, THIN FILMS, DEVICES AND THEIR CHARACTERIZATION Semiannual Report, 1 Jul. - 31 Dec. 1993
Robert F. Davis, Salah Bedair, Nadina El-Masry, and Jeffrey T. Glass

Dec. 1993 34 p
(Contract N00014-91-J-1416)
(AD-A274325) Avail: CASI HC A03/MF A01

Atomic layer epitaxy of monocrystalline Beta-SiC on Si(100) and alpha (6H)-SiC(0001) substrates has been accomplished at 850 C by alternating the supplies of Si2H6, C2H4, and atomic hydrogen without the use of a carbonizing step. Conformal deposition of SiC has been demonstrated within trenches etched into Si(100) wafers. P-type films have also been achieved using Al as a dopant. Devices including HBT's with Beta-SiC emitters have been designed. Hydrogen plasma cleaning of SiC surfaces has been studied. XPS has shown that this process effectively removes C-O, C-F and C-H bonding at the surface. Temperature programmed desorption has been used to look at the amount of subsurface hydrogen generated during plasma cleaning. The diamond precursors of chlorinated methylsilanes and the substrate of Si(100) were subjected to bias enhanced high-frequency CVD. No difference in diamond nucleation density between the precursors was observed. An interface structure of single crystal CeO2/Si(111) grown by laser ablation has been investigated. An interfacial reaction occurred between these phases during deposition which resulted in the formation of an oxygen deficient amorphous (a) CeOx layer and an SiO2 layer. Post annealing in O2 caused the disappearance of the a-CeOx and the regrowth of crystalline CeO2. DTIC

CONTROLLED HETEROGENEOUS NUCLEATION OF MELT-TEXTURED YBa2Cu3O(6+x) BY ADDITION OF Al2O3 PARTICLES
Yan L. Chen, Lijie Zhang, Helen M. Chan, and Martin P. Harmer 1992 20 p
(AD-A274605) Avail: CASI HC A03/MF A01

The reaction between alumina and yttrium barium cuprate subjected to a melt-texturing heat-treatment was studied. Microstructural examination of quenched, partially transformed samples revealed that at approximately 1050 C (which is above the incongruent melting temperature of YBa2Cu3O(6+x), a reaction layer forms at the alumina interface. The reaction products were identified as Ba6Y2Al4O15 and a copper-rich liquid phase. On cooling below the peritectic temperature, aligned domains of YBa2Cu3O(6+x) (123) were observed to preferentially nucleate at the reaction layer. For samples of melt-textured 123 deliberately seeded with alumina particles, it was found that nucleation and growth of 123 occurred exclusively at the particles. A reaction sequence for the formation of the Ba6Y2Al4O15 is put forward, together with a discussion of the possible nucleation mechanisms for the 123. DTIC

POLAR OPTICAL OSCILLATION MODES IN GaAs-BASED DOUBLE HETEROSTRUCTURES: LONG WAVELENGTH LIMIT
F. Comas (Havana Univ.,, Cuba.), R. Perez-Alvarez (Havana Univ.,, Cuba.), and C. Trallero-Giner Jul. 1993 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601874; IC-93/189) Avail: CASI HC A03 (US Sales Only)

Applying a theory developed in previous works we calculated the polar oscillation modes of a DHS (double heterostructure) of the GaAs/AlAs prototype in the long wavelength limit. The material for each layer of the structure is modeled as an isotropic continuum. We report general analytical solutions of the fundamental equations involved in the theory, allowing in principle to study an arbitrary structure of the same type with N interfaces. For the DHS case, we report amplitudes and potentials as a function of coordinates for the various oscillation modes, as well as dispersion-relation curves. Our results show good agreement with experimental data and also an excellent coincidence with ab initio microscopic calculations even for relatively large values of the in-plane wavevector. DOE

ELECTRONIC STRUCTURE OF A SINGLE OXYGEN VACANCY IN RUTILE TiO2
N. Tit Jun. 1993 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-602717; IC-93/154) Avail: CASI HC A03 (US Sales Only)

I report calculations of the electronic structure of an ideal (undistorted) oxygen vacancy in rutile TiO2 using the equation-of-motion method. I use a full phenomenological tight-binding Hamiltonian due to Vos to describe the electronic structure. The bulk band structure is also discussed in detail using the traditional Green-function method. I illustrate an efficient way to calculate the perfect crystal Green function matrix elements for any structure, including those that belong to non-symmorphic space groups. The results show that the oxygen vacancy in rutile TiO2 results in deeply localized states in its vicinity. DOE

DELOCALIZATION IN ELECTRON IMPACT IONIZATION IN A CRYSTALLINE ENVIRONMENT
L. J. Allen and C. J. Rossouw (Commonwealth Scientific and Industrial Research Organization, Melbourne, Australia.) 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601819; UM-P-92/103) Avail: CASI HC A03 (US Sales Only)

A theory for variations in cross section with diffraction conditions for electron impact ionization of atoms in a crystalline environment is presented. This takes into account, for the first time, total interaction delocalization, due both to long range Coulombic interaction and thermal smearing of the target position, by integration over all scattering angles and ejected electron momenta as well as attenuation of dynamical effects by inelastic scattering, particularly thermal diffuse scattering. These results are of fundamental importance for atom location by channeling enhanced microanalysis using energy dispersive x ray or electron energy loss spectroscopy techniques. Agreement between this theory and various energy dispersive x ray experiments reported in the literature under dynamical electron diffraction conditions is satisfactory. DOE

The effect of O(+) ion implantation on the electronic (carrier density, mobility, resistivity) and microstructural properties of thin film Sn-doped In2O3 (ITO) was studied. Both polycrystalline (c-) and amorphous (a-) ITO thin films, 200 nm thick, were implanted at substrate temperatures ranging from -196 to 300 C with 80 keV O(+) at doses ranging from 0 to 4.0 x 10(exp 15) cm(exp -2). X ray diffraction studies show that polycrystalline ITO remains crystalline even after implantation with 80 keV O(+) at -196 C to a dose of 4.0 x 10(exp 15) cm(exp -2) which suggests that dynamic recovery processes are active in ITO at this low temperature. Although the x ray diffraction pattern of the polycrystalline ITO remains unchanged with implant dose, the electrical properties were seen to degrade when implanted to a dose of 1.0 x 10(exp 15) cm(exp -2) below 200 C. In contrast, amorphous ITO films remain amorphous upon ion implantation and shows almost no degradation in resistivity when implanted below 16 C. The recrystallization temperature of amorphous ITO is about 150 C in the absence of ion implantation. DOE

FABRICATION AND CHARACTERIZATION OF NANO-CRYSTALLINE DIAMOND FILMS
D. M. Gruen, X. Pan, A. R. Krauss, S. Liu, J. Luo, and C. M. Foster 1993 18 p Presented at the 40th National Symposium of the American Vacuum Society (AVS), Orlando, FL, 15-19 Nov. 1993

(Contract W-31-109-eng-38)
(DE94-002202; ANL/CHM/CP-81063; CONF-9311104-5) Avail: CASI HC A03/MF A01

Highly uniform, smooth nano-crystalline diamond films have been fabricated with a magneto-active microwave CVD system. Top and bottom magnet currents were 145 A and 60 A, while microwave power and substrate temperature were controlled at 1500 W and 850 C during deposition. Total processing pressure was regulated at 40 Pa (300 mTorr), with gas flow rates of 30 sccm of hydrogen, 2.4 sccm of methane, and 1 sccm of oxygen. Diamond films obtained under the above conditions have grain sizes between 0.1 to 0.3 micro-m, a growth rate of 0.1 micro-m/hr, and a mean roughness of 14.95 nm. Characterization techniques have involved XRD, Raman spectroscopy, SEM, AFM, and TEM. Both x ray and electron diffraction patterns show no evidence of non-diamond phases. Although a high density of twins and stacking faults were revealed by HREM, compact diamond grains and clean intergranular boundaries (no graphitic or amorphous phases) were observed. DOE

INDIUM DONOR COMPLEXES WITH CATION VACANCIES IN CdTe AND ZnSe
J. W. Griffith, R. Lundquist, R. Platzer, J. A. Gardner, G. Karczewski (Notre Dame Univ., IN.), and J. K. Furdyna (Notre Dame Univ., IN.) 1993 6 p Presented at the 17th International Conference on Defects in Semiconductors, Gmunden, Austria, 18-23 Jul. 1993
(Contract DE-FG06-85ER-45191)
(DE94-002731; DOE/ER-45191/23; CONF-9307124-3) Avail: CASI HC A02/MF A01

Very dilute (10(exp 12) cm(exp -3)) indium donors in CdTe and ZnSe powders and in CdTe single crystals were investigated using (sup 111)In perturbed angular correlation spectroscopy. Most indium atoms are in uncomplexed sites but can form weakly-bound complexes with native defects in very defective material. The only complex observed in CdTe is an indium-Cd vacancy pair. The CdTe in which these pairs occur is apparently n-type, most Cd vacancies are free and doubly-charged, and the binding energy with indium is 0.15 eV. In ZnSe, indium can pair with a Zn vacancy or with some other presently unidentified defect. These complexes form in ZnSe containing large concentrations of both free Zn vacancies and complexes of Zn vacancies with other defects. In CdTe, the pair formation equilibration time constant is two days at 15 C, an implication that Cd vacancies are mobile at room temperature. Lattice relaxation around a Cd vacancy in CdTe was probed by single crystal PAC experiments. DOE

THE GROWTH AND CHARACTERIZATION OF GaN AS A PHOTODETECTOR Semiannual Technical Report, 1 May - 31 Oct. 1993
Wilson Ho 21 Dec. 1993 4 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-1-0499)
(AD-A274570) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A unique apparatus incorporating four independent supersonic jets and a substrate transfer mechanism for the growth of thin films in an ultrahigh vacuum chamber is under construction. The four jets are the continuous flow type and can be turned on and off with computer control allowing precise control of the reactants for atomic layer epitaxy. The supersonic jet configuration prepares the reactants with high translational energies to overcome activation barriers, enhances the impinging flux, and reduces the growth temperature and by about six orders of magnitude the growth pressure. Growth of high quality films is expected. Thin films of gallium nitride (GaN) will be grown on Si(100) using triethylgallium and ammonia as the precursors. Photodetector of GaN will be fabricated at the Cornell National Nanofabrication Facility. Second harmonic generation and atomic force microscopy measurements have been performed on GaN films on sapphire grown by Asif Khan of APA Optics. A new experiment measuring the thin film interference and band gap absorption of GaN film on sapphire has been set up in the Advanced Laboratory at Cornell University. DTIC

He(+) AND H(+) MICROBEAM DAMAGE, SWELLING AND ANNEALING IN DIAMONDS
S. P. Dooley, D. N. Jamieson, and S. Prawer 1992 22 p Presented at the 3rd International Conference on Nuclear Microprobe Technology and Applications, Uppsala, Sweden, 8-12 Jan. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601912; UM-P-92/72; CONF-9201160) Avail: CASI HC A03 (US Sales Only)

The effects of scanned 2 MeV He(+) and 1.4 MeV H(+) microbeam irradiation on unimplanted and P implanted diamond are discussed. Although diamond was found to be resistant to lattice defect production, it was found to swell very rapidly in comparison with other materials, giving rise to serious swelling induced dechanneling at scan edges at relatively low doses (10(exp 17)/cm(exp 2) for 2 MeV He(+)). Microbeams annealed the damage due to a 1.5 microns deep Phosphorus implantation at a dose of 10(exp 15)P(+)/cm(sup 2). The implantation damage was reduced at a dose of (1.6 x 10(exp 17)/cm(sup 2)) by up to 21% for 2 MeV He(+) irradiation, up to 16% for high flux 1.4 MeV H(+) irradiation and 12% for low flux H(+) irradiation. For the choice of analysis beam, all these beam effects were found to be most significant for He(+) microbeams, so H(+) microbeams should be used for analysis of diamond unless high depth resolution is required. A deterministic algorithm to study the nonlinear current-voltage characteristics of polycrystalline semiconductors, such as ZnO-based metal oxide varistors, under dc bias and at room temperature is developed based on the electrical properties of individual grain boundaries. Assuming a thermionic emission type mechanism between individual grains and a nonuniform distribution of barrier heights at grain boundaries, the set of nonlinear Kirchhoff equations that determines the macroscopic current across the specimen and the nonlinearity coefficient alpha is solved numerically. The applied voltage dependence of the barrier height is found to be crucial to obtain alpha values reaching approximately 50, indicating high nonlinearity as required by potential commercial applications. During this first quarter, the raw materials, crucibles and furnace parts required for this program were purchased and received. The initial crystal growth of Na doped KTP requires seeds of identical composition in order to minimize strain effects. For each composition examined, a preliminary crystal growth run to obtain these seeds utilized the spontaneous nucleation method. A saturated solution of proper composition is superheated to 950 C. The saturation temperature of the solution was estimated based on previously determined solubility data. The solution was programmed at 5 C/day to obtain nucleation. This process was repeated for each new composition. DTIC

Ab initio molecular dynamics calculations have shown that the 1x1:2H and the 2x1:H surfaces of diamond (C)(100) have a negative electron affinity (EA); the clean (100) surface has a positive EA. This is in agreement with experiment. Biased nucleation of C on beta-SiC(100) and Si(100) has been achieved but not on Cu(100). C nucleation densities on Hf, Ti, Ta, Ni, and W were directly related to the carbide heat of formation. The precursors of chlorinated methylsilanes coupled with bias were used to deposit C films on Si(100). Textured C(111) films were also achieved using an oxyacetylene torch. Cu forms an epitaxial rectifying contact to diamond with a Schottky barrier height (SBH) of approximately 1.1 eV. Hydrogen plasma was used to remove hydrocarbons from SiC surface at 400 C. Controlled growth of single crystal beta(3C)-and alpha(6H)-SiC films has been achieved on alpha(6H)-SiC wafers at 1050 C by gas source (GS) MBE. The growth mode of each polytype has been investigated. Rectifying Ti contacts with low ideality factors (n less than 1.09) and leakage currents (5 x 10(exp -7) A/sq cm at 10 V) and SBH's of 0.79 to 0.88 have been achieved. The three-dimensional nucleation and coalescence of islands of AlN on alpha(6H)-SiC has been discerned via TEM. Multilayers and solid solutions of AlN and SiC have been achieved and characterized. TECHNICAL REPORT OF ISSP. SER. A, NO. 2678: MAGNETIC PROPERTIES OF CARBON NANOTUBES
Hiroshi Ajiki and Tsuneya Ando May 1993 15 p
(ISSN 0082-4798)
(JTN-94-80564) Avail: CASI HC A03/MF A01

Magnetic properties of carbon nanotubes (CN's) are calculated in the effective-mass theory. The magnetic moment in a magnetic flux parallel to the tube axis oscillates as a function of the flux with period determined by the flux quantum and phase depending on whether CN is metallic or semiconducting. For a magnetic field perpendicular to the axis, CN's exhibit a large diamagnetism independent of metallic or semiconducting properties. The magnetic moment induced by a perpendicular field is about three order of magnitude as large as that by a parallel field. Author (NASDA)

TECHNICAL REPORT OF ISSP. SER. A, NO. 2681: ORBITAL AND SPIN SUSCEPTIBILITIES OF THE PLANE COPPER SITES IN YBa2Cu3O(x) SYSTEM
Tadashi Shimizu, Haruyoshi Aoki, Hiroshi Yasuoka, Toshinobu Tsuda, Yutaka Ueda, Kazuyoshi Yoshimura, and Koji Kosuge Jun. 1993 31 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan
(ISSN 0082-4798)
(JTN-94-80567) Avail: CASI HC A03/MF A01

The tensor components of the magnetic susceptibility, chi, and the Knight shift, K, at the plane Cu(2) sites have been precisely measured in YBa2Cu3O(x) with x = 6.98, 6.48 and 6.0. By using the temperature dependent chi and K observed in YBa2Cu3O(6.48), the analysis of K(sub -chi) diagram has been carried out to make a separation of the observed susceptibility into orbital and spin contributions. The obtained spin susceptibility is discussed in comparison with the theories of the Heisenberg model, the Stoner model, and a band structure calculation. A complete set of the parameter values used in the crystal field model of a Cu(2+) ion - the crystal field splittings, the orbital reduction factor, the spin-orbit coupling, and the g-factors - has been determined from the K(sub -chi) analysis. TECHNICAL REPORT OF ISSP. SER. A, NO. 2671: QUASI-LOCALIZATION OF LIGHT WAVES IN FIBONACCI DIELECTRIC MULTILAYERS
W. Gellermann, M. Kohmoto (Tokyo Univ., Japan.), B. Sutherland, and P. C. Taylor Apr. 1993 15 p
(ISSN 0082-4798)
(JTN-94-80557) Avail: CASI HC A03/MF A01

It has been measured that the optical transmission of quasiperiodic dielectric multilayer stacks of SiO2 (A) and TiO2 (B) thin films which are ordered according to a Fibonacci sequence S(sub (j+1)) = (S(sub (j-1)), S(sub j)), with S(sub 0) = (B) and S(sub 1) = (A) up to the sequence S9 which consists of 55 layers. A scaling of the transmission coefficient with increasing Fibonacci sequences at quarter-wavelength optical thicknesses is observed. This behavior is in good agreement with theory and can be considered as experimental evidence for the quasi-localization of the light waves. Author (NASDA)

TECHNICAL REPORT OF ISSP. SER. A, NO. 2674: HIGH-FIELD CYCLOTRON RESONANCE AND IMPURITY TRANSITION IN n- AND p-3C-SIC AT MAGNETIC FIELDS UP TO 175 T
Junichiro Kono, Shojiro Takeyama, Hiroyuki Yokoi, Noboru Miura, Mitsugu Yamanaka, Mikiya Shinohara, and Keiko Ikoma Apr. 1993 31 p
(ISSN 0082-4798)
(JTN-94-80560) Avail: CASI HC A03/MF A01

Magneto-transmission experiments have been carried out on 3C-SiC thin films grown on Si(100) substrates, using the combination of pulsed high magnetic fields up to 175 T generated by the single-turn coil technique and pulsed far-infrared radiations from an H2O(D2O) laser at photon energies up to 73.2 meV. In n-type 3C-SiC, two Cyclotron Resonance (CR) peaks have been observed for B parallel to k parallel to greater than 100 less than over a wide range of photon energy 10.4 - 53.8 meV, corresponding to the light- and heavy-mass valleys at the X-points, i.e., m(sub t)(sup *)

= (0.25 +/- 0.01)m(sub 0) and (m(sub t)(sup *) m(sub 1)(sup *))(exp 1/2) = (0.41 +/- 0.01)m(sub 0). These values are in agreement with those of Kaplan obtained from CR at low fields. This leads to a conclusion that the conduction band in 3C-SiC is very parabolic up to 53.8 meV, and that unlike GaP the effect of camel's back structure is unobservable. A number of impurity transitions were observed for the first time at temperatures below 100 K with photon energies ranging from 34.4 to 73.2 meV. It was found that the observed lines originate from three different donor states which have different binding energies, E(sub d) = 19, 35 and 53 meV. The first observation of hole CR was also made in p-type 3C-SiC. A broad but prominent peak was observed with an effective mass of 0.45m(sub 0), at temperatures around 210 K and at wavelength of 119 micrometers.

TECHNICAL REPORT OF ISSP. SER. A, NO. 2670: ELECTRONIC STRUCTURE OF LIGHT TRANSITION METAL COMPOUNDS STUDIED BY PHOTOEMISSION

S. Shin, Y. Tezuka, T. Ishii, and Y. Ueda Apr. 1993 15 p
(ISSN 0082-4798)
(JTN-94-80556) Avail: CASI HC A03/MF A01

The valence band photoemission has been measured on ScF3, TiO2 and V2O5 which have no 3d electron nominally. The charge-transfer satellites are found in the region from 11 eV to 17 eV below the top of the valence band. It is concluded from the resonant photoemission that the charge-transfer-type configuration is manifest to form the valence state in the ground state in addition to the originally filled-up 2p state of ligand.

TECHNICAL REPORT OF ISSP. SER. A, NO. 2672: MAGNETO-OPTICAL EFFECTS OF EXCITONS IN BiI3 CRYSTALS UNDER PULSED HIGH MAGNETIC FIELDS. 3: EXCITONS CONFINED AROUND A STACKING DISORDER FORMED BY A BENDING STRESS

Katsuyoshi Watanabe, Shojiro Takeyama, Noboru Miura, Teruo Komatsu, Takenori Higashimura, and Takeshi Iida Apr. 1993 30 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan
(ISSN 0082-4798)
(JTN-94-80558) Avail: CASI HC A03/MF A01

It has been observed that a series of new lines in the absorption and luminescence spectra of BiI3 crystals are strained by a bending stress. The magnetic field effects on these lines were investigated in pulsed high magnetic fields up to 47 T. The magneto-optical spectra were well explained by the cationic exciton model. The origin of the lines was concluded to be an exciton state confined around a stacking disorder, which was formed by the deformation. The quantum size effect of the excitons in the specific region of the stacking disorder is discussed. Author (NASDA)

MORPHOLOGY TRANSITIONS DURING NON-EQUILIBRIUM GROWTH PROCESSES M.S. Thesis

Ofer Shochet Apr. 1992 107 p
(ITN-94-85236) Copyright Avail: Issuing Activity (Tel-Aviv Univ., Exact Sciences Library, Ramat Aviv 69978, Israel)

The diffusion-transition scheme was developed to study interfacial pattern formation during diffusion-limited growth in systems described by a conserved order parameter. The new approach is inspired by the specific example of solidification from supersaturated solutions, for which advantage was taken of new experimental observations in surface kinetics. The time dependence in the metastable phase (the concentration of solute) is evaluated by solving the continuous linear diffusion equation. The motion of the interface is described by the statistical mechanics of discrete phase transitions (solidification and melting) at the interface. Both processes are simulated alternately, each for a time period which is shorter than the characteristic time of both processes. The new approach enables us to investigate both equilibrium and non-equilibrium situations. The model can be related both to experimental results and to those of the phenomenological free boundary model. It also enables us to simulate very large systems in a reasonable time and so to investigate generic features of late-stage growth. The new scheme enables us to investigate different kinetics of phase transition at the interface. Complete information of the concentration field is gained. First, the average equilibrium shapes are compared with those evaluated by the Wulff construction. The fluctuations of the interface about the average shape as well as the temporal fluctuation in the diffusion field were calculated.

TECHNICAL REPORT OF ISSP. SER. A, NO. 2675: HIGH-FIELD CYCLOTRON RESONANCE AND VALENCE-BAND STRUCTURE IN SEMICONDUCTING DIAMOND

Junichiro Kono, Shojiro Takeyama, T. Takamasu, Noboru Miura, Naoji Fujimori, Yoshiki Nishibayashi, Takeshi Nakajima, and Kazuo Tsuji Apr. 1993 33 p
(ISSN 0082-4798)
(JTN-94-80561) Avail: CASI HC A03/MF A01

Cyclotron resonance of thermally excited free holes has been observed in synthetic semiconducting diamond at ultra-high magnetic fields up to 150 T generated by the single-turn coil technique with pulsed far-infrared laser radiations of 28, 36 and 119 micrometers. Three absorption peaks were observed at and above room temperature for the magnetic fields parallel to (100), (111), and (110) crystallographic directions. The typical value of omega(sub c) tau was as small as two at 40 C even in ultra-high fields. One of the three peaks was observed in the Cyclotron Resonance Inactive (CRI) circular polarization for holes, whilst the other two lines were observed in Cyclotron Resonance Active (CRA) for holes. Assuming that these resonance absorption lines are due to three holes of the valence-bands at the gamma-point, i.e. light-hole, heavy-hole, and split-off-hole, it is able to be concluded that the band dispersion curve for one of the three bands has a negative (electron-like) curvature in some directions. TECHNICAL REPORT OF ISSP. SER. A, NO. 2676: CHARGE MASS SINGULARITY IN TWO-DIMENSIONAL HUBBARD MODEL

Nobuo Furukawa and Masatoshi Imada May 1993 13 p
(ISSN 0082-4798)
(JTN-94-80562) Avail: CASI HC A03/MF A01

Two-dimensional Hubbard model with both the nearest and the next-nearest neighbor transfer is studied. A singularity in the charge susceptibility at the Mott transition point delta approaches 0 is observed, leading to the anomaly of the charge mass m(sub c)(sup *) in the form m(sub c)(sup *) varies with (absolute value of delta)(exp -1)(sup *), where delta is the doping concentration. The singularity is similar to the case without the next-nearest neighbor transfer. It indicates that the singularity in the charge mass is a universal nature of this model irrespective of its band structure. Author (NASDA)

EXPERIMENTAL MEASUREMENT OF LOCAL DISPLACEMENT AND CHEMICAL PAIR CORRELATIONS IN CRYSTALLINE SOLID SOLUTIONS

C. L. Sparks, G. E. Ice, J. L. Robertson, and L. B. Shaffer (Anderson Univ., IN.) 1993 10 p Presented at the NATO Advanced Study Workshop on Metallic Alloys: Experimental and Theoretical Perspectives, Boca Raton, FL, 16-21 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE94-001124; CONF-930759-3) Avail: CASI HC A02/MF A01

Measurement of near-neighbor atomic arrangements in crystalline solid solutions is well established and provides meaningful values for chemical preference of atoms for their near neighbors to beyond the first ten neighboring shells. Static displacements (atomic size) between these atom pairs have mostly been either ignored in the recovery of the local pair preferences or removed by making use of the displacement scattering dependence on momentum transfer. With intense and energy tunable x-ray synchrotron sources, our ability to recover these static displacements between atoms has greatly improved. Data taken with multiple x-ray energies to obtain the contrast necessary to separate like from unlike neighbor pair distances are discussed for the two cases studied to date: a locally ordered Ni(77.5)Fe(22.5) crystal and a locally clustered Fe53Cr47 crystal. Analysis of experimental parameters and data gives the systematic and statistical errors on the recovered parameters. Meaningful atomic displacements from the mean lattice can be measured and recovered. These displacements help us understand material properties and will provide theorists with tests for their calculations. DOE

A sintered polycrystalline body is disclosed which consists essentially of magnesia alumina spinel having an in-line transmittance per 1.88 mm thickness of not less than about 62.5 percent at a wavelength of about 0.2 microns and not less than 85 percent at a wavelength of about 0.3 microns. The material retains at least about 90 percent of its original transmissivity after as much as 240 hours or more of exposure to ultraviolet light in the 0.2-0.4 micron wavelength range. The sintered body has a flexural strength of at least about 15,000 psi. The sintered transparent body can be produced by a two-step process in which a spinel powder is formed into a closed porosity body by hot pressing or pressureless sintering. The closed porosity body is then hot isostatic pressed at a temperature of at least about 1,400 C under a pressure of at least about 15,000 psi. The sintered body so produced has a grain size under about 150 microns, a porosity less than about 0.001 percent, and a transmittance previously specified. Substantially larger grain sizes result in reduced strength, while substantially smaller grain sizes result in unacceptable ultraviolet transmission. The invention relates in particular to a missile dome and a launch tube window which has high ultraviolet transmittance properties and is stable under high temperatures, corrosive environments, and resistant to abrasion or erosion. FIRST PRINCIPLES CALCULATIONS FOR THE CLEAVED AND ANNEALED Ge(111) SURFACES
N. Takeuchi, E. Tosatti, and A. Selloni (International School for Advanced Studies, Trieste, Italy.) Nov. 1992 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617048; IC-92/367) Avail: CASI HC A03 (US Sales Only)

Ab initio Molecular Dynamics was used to study the structural and electronic properties of cleaved and annealed Ge(111) surfaces. New features emerge for both structures. For the (2x1) it is found that even though the stable state has a pi-bonded chain structure, there are two isomers with the tilt angle of the chain in opposite directions. For the c(2x8) an asymmetry was found in the surface unit cell, in agreement with Low Energy Electron Diffraction (LEED) experiments that show weak quarter-order spots. This inequivalence also produces a splitting of the rest atom and adatom dangling bond, which explains recent STM experiments. DOE

TECHNICAL REPORT OF ISSP. SER. A, NO. 2669: RELATIONS BETWEEN OXYGEN DEFICIENCY AND STRUCTURES IN THE La-Sr-Cu-O SYSTEM. 3: OXYGEN CONTENTS AND STRUCTURE OF (La, Sr)8Cu8O(16+DELTA) PHASE
Kenji Otzschi, Keiichi Koga, and Yutaka Ueda Apr. 1993 39 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan
(ISSN 0082-4798)
(JTN-94-80555) Avail: CASI HC A03/MF A01

The oxygen content of (La(1-x)Sr(x))8Cu8O(16 + delta) was determined for variously heat-treated samples. It increases with increasing partial pressure of oxygen, for example, x = 0.75 and delta = 0.08 (annealed in Ar at 810 C), 0.27 (quenched from 1050 C in air), 2.29 (annealed in O2 at 800 C), and 2.54 (treated under O2 high-pressure 300 atm). X-ray diffraction studies indicate that there are two distinct phases, the oxygen-poor phase (delta approx. = 0.0--the 8-8-16 phase) and the oxygen-rich phase (delta greater than or equal to 2.0--the 8-8-18 phase). TECHNICAL REPORT OF ISSP. SER. A, NO. 2682: PRESSURE DEPENDENCE OF Sm:YAG FLUORESCENCE TO 50 GPa: A NEW CALIBRATION AS A HIGH PRESSURE SCALE
Hitoshi Yusa, Takehiko Yagi, and Haruo Arashi Jun. 1993 18 p
(ISSN 0082-4798)
(JTN-94-80568) Avail: CASI HC A03/MF A01

The pressure-induced wavelength shift of laser excited fluorescence in Samarium doped Yttrium Aluminum Garnet (Sm:YAG) was measured at up to 50 GPa at room temperature. The intense peaks between 618 nm and 611 nm were analyzed as a triplet, Y1, Y2, and Y3, by curve fitting analysis using Lorentzian function. The Y1 (lambda(sub 0) = 618 nm) peak was the strongest peak up to 40 GPa while the Y2 (lambda(sub 0) = 616 nm) peak became the strongest above it. As the temperature dependence of the fluorescence shift of Sm:YAG is negligibely small, these pressure scales will be useful for high pressure and high temperature experiments using diamond anvil cell. The shape of an interface while a crystal is growing inside a crystal growth furnace is an important measurement to assess the crystal quality on-line. If the crystal surface can be visualized by video or x ray imaging, the interface shape can be determined by the stereo image processing techniques. This paper presents a methodology to determine the shape of the solid-melt interface by stereo based imaging techniques while the crystal is growing inside a transparent furnace. The methodology generates qualitative shape information provided that a good pair of stereo images of the interface can be captured. For a quantitative shape description, i.e., for the determination of interface points with respect to a fixed coordinate frame, both cameras must be calibrated. This paper illustrates the methodology for qualitative shape determination of lead bromide crystal interface. Author (revised)

FLOAT ZONE CRYSTAL GROWTH USING LASER RADIATION [LASERGESTUTZTE KRISTALLZUCHT NACH DEM ZONENSCHMELZVERFAHREN]
Josef Muckenschnabel, Uwe Becker, Uwe Brauch, and Alexander Cohen May 1993 43 p
(ISSN 0939-2963)
(DLR-FB-93-10; ETN-94-95492) Avail: CASI HC A03/MF A01

A float zone crystal growth apparatus was developed and built. To evaluate the influences of different laser wavelengths on crystal growth, the molten zone was heated either by CO2 (10 micrometers) or CO (5 micrometers) laser radiation. Transparent single crystals of Ti:Al2O3, Nd:YAG (Yttrium Aluminum Garnet), and Yb:YAG with diameters up to 6 mm were obtained. In an oxygen containing atmosphere of 100 to 200 Torr, YAG crystals could be grown with a flat interface. This was achieved either by heating the molten zone with the CO laser or at high counterrotation rates with the CO2 laser. In the Al2O3, no significant influence of laser wavelength on the interface shape was noticed. To reduce the high temperature gradients, an afterheater in the form of an 'ellipsoidal' reflector was installed. ESA

EFFECT OF TEMPERATURE AND RECOIL-ENERGY SPECTRA ON IRRADIATION-INDUCED AMORPHIZATION IN Ca2La8(SiO4)6O2
W. J. Weber and L. M. Wang (New Mexico Univ., Albuquerque.) Sep. 1993 16 p Presented at the Nuclear Instruments and Methods in Physics Research on Radiation Effects in Insulators, Nagoya, Japan, Sep. 1993
(Contract DE-AC06-76RL-01830)
(DE94-004371; PNL-SA-22525; CONF-9309259-2) Avail: CASI HC A03/MF A01

Single crystals of Ca2La8(SiO4)6O2 have been irradiated with different ions/energies in an in situ study of the effects of temperature and recoil-energy spectra on irradiation-induced amorphization. The dose for complete amorphization increases with temperature in two stages. The low-temperature stage (below 250 K) has an activation energy of 0.01 +/- 0.003 eV and is believed to be associated with simultaneous close-pair recombination. The high-temperature stage (above 250 K) has an activation energy of 0.13 +/- 0.02 eV and may be associated with irradiation-enhanced defect mobility. The critical temperature for amorphization increases from approximately 360 K for 0.8 MeV Ne(+) to approximately 710 K for 1.5 MeV Kr(+). At 15 K, the amorphization dose is approximately 0.36 dpa and is independent of recoil-energy spectra. The amorphization dose increases more rapidly with temperature for Ne(+) due to the larger fraction of mobile defects produced by the low energy recoils. The temperature dependence is similar for 1.0 MeV Ar(+), 1.5 MeV Kr(+), and 1.5 MeV Xe(+). DOE

RESEARCH ON HIGH-EFFICIENCY, LARGE-AREA, CuInSe2 BASED THIN-FILM MODULES
K. E. Knapp and R. R. Gay Jan. 1994 39 p Prepared in cooperation with Siemens Solar Industries, Camarillo, CA
(Contract DE-AC02-83CH-10093)
(DE94-000259; NREL/TP-413-6216) Avail: CASI HC A03/MF A01

This report describes work to demonstrate 12.5% aperture efficient, large-area (3900-sq cm) encapsulated thin-film CuInSe2 (CIS) photovoltaic modules. Module design consists of 53 series-connected ZnO/CdS/CIS/Mo/glass cells fabricated on a 4141-sq cm (128.6 x 32.2 cm) glass substrate with a nominal aperture area of 3895 sq cm (127.3 x 30.6 cm). Four CIS modules were shipped to NREL under the terms of the subcontract. Phase 2 consisted of fabricating large-area (3900-sq cm) modules for high-performance module processing. The large-area parts proved to be cumbersome, and we decided to use smaller substrates (100 sq cm) to accelerate the progress in solving the types of technical challenges that were discovered in processing large-area parts, and then to apply these solutions to larger areas to meet the objectives of the investigation. Most critical issues determining module yield losses can be grouped into three major categories: (1) Uniformity and reproducibility of the absorber formation process dominates the fundamental performance of the material over a large area, (2) interaction of the substrate with the Mm requires appropriate selection criteria and preparation techniques for minimizing defects that lead to shunting and areas of poor photoresponse, and (3) performance losses near interconnects reduce module performance and can cause inadequate performance through module durability testing. STUDY OF THE HYPERFINE MAGNETIC FIELD AT Ta-181 SITE IN THE HEUSLER Co2ScSn, Co2ScGa, AND Co2HfSn ALLOYS
Roberta Nunes Attili 1992 101 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-603989; INIS-BR-3149) Avail: CASI HC A06 (US Sales Only)

The hyperfine magnetic fields acting on Ta-181 nuclei at the Sc and Hf sites have been measured in Heusler alloys Co2ScSn, Co2ScGa, and Co2HfSn using the time differential perturbed gamma-gamma angular correlation (TDPAC) technique. The measurements were carried out using an automatic spectrometer consisting of two BaF2 detectors and the conventional electronics. The magnitude of hyperfine magnetic field at Ta-181 was measured for all the alloys. The signs of the field were determined in the cases of Co2ScSn and Co2HfSn alloys by performing the perturbed angular correlation measurements with an external polarizing magnetic field of approximately equal to 5 k Gauss. The hyperfine magnetic fields obtained are -187.6 +/- 3.3 and 90.0 +/- 2.1 kOe measured at 77 K for Co2ScSn and Co2ScGa alloys respectively, and -342.4 +/- 10.1 kOe measured at the room temperature for Co2HfSn alloy. These results are discussed and compared with the hyperfine magnetic field systematics in Co-based Heusler alloy. DOE

CORRELATED MEAN FIELD ANSATZ FOR THE KONDO NECKLACE
H. Y. Kee and P. Fazekas Aug. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-603671; IC-93/248) Avail: CASI HC A03 (US Sales Only)

The ground state phase diagram of the pseudospin model introduced by Doniach to describe the essential physics of Kondo lattices is studied. Variational trial states are used which augment the usual mean field solution by incorporating various intersite correlations. A composite spin correlation describing the antiparallel alignment of fluctuating triplets is found to be particularly favorable for large Kondo couplings. With this trial state, the magnetic-to-Kondo transition is suppressed and the strong coupling ground state is ordered with strongly reduced moments. The relevance of the findings is discussed. DOE

LOCALIZATION PROPERTIES OF ONE-DIMENSIONAL ELECTRIFIED CHAINS
R. Ouasti, A. Brezini, and N. Zekri Aug. 1993 17 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-603672; IC-93/249) Avail: CASI HC A03 (US Sales Only)

A Kronig-Penney model with a constant electric field for a noninteracting electron is used to study the transmission properties of Anderson transition in one-dimensional systems with disordered strengths of delta-function potentials. The authors examined the cases where the potential varies uniformly from O to W (barriers) or from -W to O (wells) for a given disorder W. Mainly, the authors observe unexpected abrupt transition at the points E + Fx = n(exp 2) pi(exp 2). However, these transitions are related to the small oscillations observed by Soukoulis et al. in the mixed case (wells and barriers). An interesting feature in the wells is that in the presence of a small field the states become more localized and the localization length decrease up to a minimum for a critical value F(sub m). In the end, the authors have studied the effect of the disorder on the Anderson transition by the mean of the participation ratio and the localization length. DOE

GAUGE INVARIANCE AND TRANSPORT PROPERTIES IN SUPERCONDUCTORS ABOVE T(c)
A. G. Aronov, S. Hikami (Tokyo Univ., Japan.), and A. I. Larkin (Weizmann Inst. of Science, Rehovoth, Israel.) Jun. 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-604013; IC-93/129) Avail: CASI HC A03 (US Sales Only)

We have developed a theory of transport phenomena for superconductors above T(sub c) in the fluctuations region in dirty and clean limits. We show that it is possible to construct a phenomenological theory based on Ginzburg-Landau equation and its gauge invariance, and as a result we can express the fluctuation corrections to the conductivity tensor in a magnetic field in terms of the classical conductivity and coherence lengths. We find that the sign of the Hall conductivity is universal, and we present the method by which it is determined. DOE

DECAY OF NON-EQUILIBRIUM POLARITON CONDENSATE IN SEMICONDUCTORS
Igor V. Beloussov (Academy of Sciences of the Moldavian SSR, Kishinev.) and Yuri M. Shvera Aug. 1993 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-604016; IC-93/235) Avail: CASI HC A02 (US Sales Only)

Excitation dynamics of polariton quantum fluctuations arising in direct-gap semi-conductor as a result of parametric decay of non-equilibrium polariton condensate with non-zero wave vector is studied. The predominant mechanism of polariton scattering is supposed to be exciton-exciton interaction. Steady state, which corresponds to the case of dynamic equilibrium between the polariton condensate and quantum fluctuations, is obtained. Distribution functions of non-condensate polaritons are localized in the resonant regions, corresponding to two-particle excitation of polaritons from the condensate. The spectrum of elementary excitations in steady state coincides with usual polariton energy with the shift proportional to initial density of polariton condensate. DOE

INFLUENCE OF LATTICE DAMAGE ON RETENTION AND TRANSPORT OF DEUTERIUM IN BETA SILICON CARBIDE
W. R. Wampler and R. A. Causey Oct. 1993 18 p
(Contract DE-AC04-76DR-00789)
(DE94-005206; SAND-93-2007) Avail: CASI HC A03/MF A01

Experiments were done to determine the effect of lattice damage on solubility and transport of deuterium (D) in silicon carbide. Beta SiC samples were irradiated with energetic ions to produce lattice damage, and were then soaked in D2 gas at 1000 C. Concentration of D versus depth was then measured by nuclear reaction analysis. Very near the surface (less than 0.5 micron), concentration of D was larger in irradiated than in unirradiated, but beyond 1 micron the D concentrations were similar (approximately 20 +/- 10 atomic ppM), even though the damage extended to 2.2 micron in most of the samples. Results from this study of ion irradiated SiC together with a previous study of tritium migration in undamaged SiC point to the conclusion that uptake of D from gas into SiC occurs by transport along grain boundaries, whereas uptake of D into lattice damage produced by ion irradiation and release of energetically implanted D both require permeation of D within grains which is much slower. Solid state compounds involving Ln and 4-MeO-BP, where Ln = trivalent lanthanides (except promethium) and yttrium and 4-MeO-BP = 4-methoxy benzylidene pyruvate, were prepared by addition of ligand to the corresponding metal ions chlorides, both in aqueous solution. The precipitates were washed with distilled water and dried at ambient temperature in a forced circulation oven. Complexometry with EDTA, thermogravimetry (TG), differential scanning calorimetry (DSC), and x ray diffraction have been used in the study of these compounds. DOE

CHARACTERIZATION OF SEMI-INSULATING GALLIUM ARSENIDE Final Report, 18 Nov. 1992 - 17 Nov. 1993
John S. Blakemore 29 Nov. 1993 22 p
(Contract N00014-93-P-2005)
(AD-A273781; N93-015) Avail: CASI HC A03/MF A01

The project was established 18 Nov. 1992 to continue for 12 months. Its purpose has been electrical and optical characterization of samples from semi-insulating (SI) melt-grown crystals of gallium arsenide (GaAs). As a further definition of the project's purpose, the primary goal has been to assist NRL in assessing the properties of SI GaAs crystals grown at NRL by the vertical zone melt (VZM) method. A second aspect of this characterization work has involved samples from SI GaAs crystals grown by various commercial vendors including samples of pre-synthesized GaAs evaluated for its suitability as starting 'feedstock' for VZM growth. Measurements made at Western Washington University (WWU) under the terms of this project accord with a Statement of Work provided at the outset. These have included the following: (1) low-field dc electrical transport data for SI GaAs samples, as functions of temperature; (2) near-infrared (NIR) transmittance/absorption spectra of polished slabs, with data concerning the well-known EL2 defect determined from NIR absorption strength and spectral form; and (3) mid-IR data on absorption caused by carbon acceptors in SI GaAs. Lawrence Berkeley Lab.), and J. Ross (California Univ., Berkeley. Lawrence Berkeley Lab.) 12 Nov. 1993 8 p Presented at the NOVEL Laser Sources and Applications Workshop, San Jose, CA, 12-13 Nov. 1993
(Contract W-7405-eng-48)
(DE94-003638; UCRL-JC-115682; CONF-9311138-1) Avail: CASI HC A02/MF A01

The authors report the first observation of optically pumped stimulated emission from an GaN epilayer at 77K and at room temperature grown by reactive ion-beam molecular beam epitaxy. The observed UV optical emission profile was a nonlinear function of the pump power density, with line narrowing at threshold power densities. The similarity in the emission profile as compared with those of films grown with low-pressure metal-organic chemical vapor deposition and metal-organic vapor phase epitaxy techniques will be noted. HYPERFINE STRUCTURE OF POSITRONIUM ENERGY LEVELS IN A CRYSTAL
I. V. Bondarev and S. A. Kuten Jul. 1993 8 p
(DE94-603898; IC-93/226) Avail: CASI HC A02/MF A01 (US Sales Only)

Hyperfine structure of positronium energy levels in crystal solids with noncubic lattice is considered. It is shown that due to the hyperfine interaction between the electron and the positron positronium atom in a crystal can have effective quadrupole moment and tensor polarizability. In such a case the effective quadrupole interaction with intracrystalline fields leads to the quadrupole splitting of triplet level and also to the positronium magnetic quenching anisotropy in the presence of external magnetic field. The possibilities of experimental observation of such anisotropy are discussed.

HIGH TEMPERATURE GRAIN GROWTH AND OXIDATION OF Fe-29Ni-17Co (KOVAR (TM)) ALLOY LEADS
J. J. Stephens, F. A. Greulich, and L. C. Beavis 1993 34 p Presented at the Minerals, Metals, and Materials Society/American Society for Metals (TMS/ASM) Materials Week 1992, Chicago, IL, 2-5 Nov. 1992
(Contract DE-AC04-94AL-85000)
(DE94-004691; SAND-93-2168C; CONF-9211117-12) Avail: CASI HC A03/MF A01

One important application for the Fe-29Ni-17Co (Kovar(trademark)) alloy in wire form is in brazed feed through assemblies which are integral parts of vacuum electronic devices. Since Cu metal brazes are performed at process temperatures of about 1100 C, there is opportunity for significant grain growth to occur during the brazing operation. Additional high temperature exposure includes decarburization of the Fe-29Ni-17Co alloy wire in wet hydrogen for 30 min. at 1000 C prior to the Cu brazing operation. Two approaches were used to characterize grain growth in two lots of Fe-29Ni-17Co alloy: (1) a once-through processing study to study the effect of one-time-only device thermal processing on the resulting grain size, and (2) an isothermal grain growth study involving various times at 800-1100 C. The results of the once-through processing study indicate that acceptable grain sizes are obtained from both cold worked and mill-annealed wire lots following Cu brazing. The isothermal grain growth study indicates that the linear intercept distance for Fe-29Ni-17Co can be described with a power law function of time, and that thermal exposure must be controlled at temperatures in excess of 900 C in order to avoid excessive grain growth. A second study characterized the oxidation kinetics of Fe-29Ni-17Co alloy wire in air at temperatures ranging from 550-700 C. This study indicates the parabolic growth law applies for this material, and between 550 and 700 C, oxidation in this alloy occurs at an activation energy of 27.9 kcal/mole. Other oxidation studies at higher temperatures (greater than 750 C) indicate an activation energy of 52.2 kcal/mole for oxidation of Fe-29Ni-17Co alloy at temperatures greater than 790 C. Quantitative point analyses of the oxide scale formed at 600 C suggest that a significant fraction of the scale is close to the stoichiometry of the Fe2O3-type oxide.

TECHNICAL REPORT OF ISSP. SER. A, NO. 2677: OCTA-TWIN MODEL OF TETRAPOD ZnO CRYSTALS
Shin Takeuchi, Hiroshi Iwanaga, and Mitsuhiro Fujii (Nagasaki Univ., Japan.) May 1993 15 p
(ISSN 0082-4798)
(JTN-94-80563) Avail: CASI HC A03/MF A01

The characteristic morphology of tetrapod-shaped ZnO particles grown by oxidizing zinc vapor in air has been thoroughly interpreted by the growth process from octahedral multiple-twin embryos. The origin of the tetrapod-shape consists in: (1) formation of the octahedral multiple-twin due to small c/a ratio of the wurtzite ZnO; (2) inversion-type twin boundaries; and (3) a large growth anisotropy with respect to the crystal polarity.

ELECTRON MICROSCOPY STUDIES OF UNDOPED AND PHOSPHORUS DOPED Si:H AND Si,C:H FILMS
Y. L. Chen (North Carolina State Univ., Raleigh.), C. Wang (North Carolina State Univ., Raleigh.), G. Lucovsky (North Carolina State Univ., Raleigh.), D. M. Maher (North Carolina State Univ., Raleigh.), and J. Bentley 1993 7 p Presented at the Spring Meeting of the Materials Research Society, San Francisco, CA, 12-16 Apr. 1993
(Contracts DE-AC05-84OR-21400; DE-AC05-76OR-00033)
(DE94-004738; CONF-930405-52) Avail: CASI HC A02/MF A01

Microstructure of undoped and phosphorus doped Si:H and Si,C:H films was analyzed by selected-area diffraction, conical dark-field imaging, energy-dispersive x-ray spectroscopy, and electron energy-loss spectroscopy in transmission electron microscopes. Thin films were synthesized by remote plasma-enhanced chemical vapor deposition and characterized in terms of degree of crystallinity. Distribution of phosphorus in Si:H and Si,C:H films, and of carbon in Si,C:H films was evaluated. Results indicate that (1) the microstructure of a film may be two phase, consisting of silicon microcrystallites in an amorphous matrix, (2) phosphorus doping as well as the presence of carbon influences the degree of crystallinity by reducing the average size and volume fraction of microcrystallites, (3) the presence of carbon and phosphorus doping completely suppresses the crystalline phase, (4) phosphorus is distributed at approximately the same concentration in both the crystalline and amorphous phases of diphasic films, and (5) carbon is detected in the amorphous phase of the Si,C:H films. THERMALLY STABLE OXYGEN AND NITROGEN IMPLANT ISOLATION OF C-DOPED Al(0.35)Ga(0.65)As
J. C. Zolper, M. E. Sherwin, A. G. Baca, and R. P. Schneider, Jr. 1993 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract DE-AC04-94AL-85000)
(DE94-004799; SAND-93-1509C; CONF-931108-28) Avail: CASI HC A02/MF A01

Oxygen and nitrogen ion implantation were applied to C-doped Al(0.35)Ga(0.65)As layers to produce high resistivity regions (rho)(sub s) greater than or equal to 1 x 10(exp 10) (Omega)/(open square) that are stable after annealing at 900 C. A dose threshold for stable compensation for both O and N ions was found above 8 x 10(exp l3) cm(sup -2) for samples doped at 2 x 10(exp l8) cm(sup -3). Although O implantation was reported to form stable compensation in Si-doped and Be-doped AlGaAs, the ability of nitrogen implantation to produce thermally stable compensation was not previously reported and may be due to a C-N complex. The existence of this C-N complex is supported by results for O- and N-implants into C-doped GaAs where N formed thermally stable compensation but O did not. Sheet resistance data versus anneal temperature and estimates of the depth of the defect levels are reported. This result will have application to heterojunction bipolar transistors and complementary heterostructure field effect transistor technologies that employ C-doped AlGaAs or GaAs layers along with high temperature post-isolation processing. IMAGE POTENTIAL OF A TUNNELLING ELECTRON MOVING NEAR TWO DIFFERENT METALS
Do Nam Aug. 1993 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-603657; IC-93/251) Avail: CASI HC A03 (US Sales Only)

The image potential of a tunnelling electron near two metal surfaces is studied by calculating its self-energy, applying hydrodynamic model for two different metals separated by a narrow vacuum gap. The self-energy is calculated for its motion in every metal and in the vacuum gap between them. The most important limiting cases for the self-energy are also derived. Agreement between our results in corresponding limits with previous ones is shown.

DAMAGE GROWTH IN MgAl2O4 CRYSTALS BY Xe ION IRRADIATIONS
Ning Yu, M. Nastasi, M. G. Hollander, C. R. Evans, C. J. Maggiore, K. E. Sickafus, and J. R. Tesmer 1993 6 p Presented at the Fall Meeting of the Materials Research Society (MRS), Boston, MA, 29 Nov. - 3 Dec. 1993
(Contract W-7405-eng-36)
(DE94-005009; LA-UR-93-4326; CONF-931108-31) Avail: CASI HC A02/MF A01

We have studied damage kinetics in single crystal MgAl2O4 (spinel) with (100) orientation under 370 keV Xe ion irradiations at temperatures of -100 and 400 C. In-situ Rutherford Backscattering Spectrometry (RBS) and ion channeling have been used to monitor the damage accumulation in spinel following sequential Xe ion irradiations. A significant temperature effect on the irradiation damage has been found. Channeling data show that at -100 C, the irradiated spinel layer reaches the same level as in a random spectrum at a dose of 8 x 10(exp 15) Xe/cm(exp 2) (20 DPA for peak damage), while at 400 C, the near surface region (50 nm) remains single-crystalline up to 2 x 10(exp I6) Xe/cm(exp 2). Some f-f transitions of Ln(An) metallic ions have particular super-sensitivity to the change of coordination environments. This is called super-sensitive transitions. Based on the irreducible tensor operator method, a computation model and corresponding computer program for calculating the hypersensitive transition spectrum of f-element were developed. By comparing the theoretical spectra of all possible coordination structures with the experimental one, the possible coordination structures of complex can be determined. The coordination structures of Nd(3+), Er(3+) hydrate, and their extraction complex with H(DEHP) were successfully determined by this method, and the experimental spectra were also assigned. DOE

ANISOTROPY IN THE ELECTRICAL, MAGNETIC AND OPTICAL PROPERTIES OF Pb2Sr2RCu3O8 Ph.D. Thesis
Maureen Reedyk Sep. 1992 259 p
(ISBN-0-315-84930-4; CTN-94-61109) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Measurements of anisotropy in the magnetization, direct current resistivity, and optical properties of Pb2Sr2(Y/Ca) Cu3O8 (PSYCCO) superconductors are presented. The in-plane and c-axis fundamental superconducting parameters of the material were extracted from analysis of the magnetization measurements. The optically derived plasma frequency is considerably smaller while the resistivity is an order of magnitude larger than in both Bi-Sr-Ca and Y-Ba cuprate superconductors. Along with large penetration depth, this suggests that the carrier concentration is unusually small given the high (about 80 K) transition temperature (Tc) and represents a significant deviation from a proposed universal relationship between the level of doping and Tc. The extent of anisotropy in this system is similar to that in YBa2Cu3O(7-x). The doping dependence of the ab-plane optical properties is investigated via the Ca-free Pb2Sr2RCu3O8 series, which exhibits a metal to insulator transition with increasing ionic radius of the rare earth R. In this progression, phonons in the far infrared reflectance of the insulating members become weaker while new phonon modes appear. Examination of several high-Tc superconductors with similar structure leads to the hypothesis that these features are due to the coupling of longitudinal c-axis phonons to the ab-plane mid infrared continuum. (DE93-634760; IC-93/155) Avail: CASI HC A03/MF A01 (US Sales Only)

Results of statistical noise smoothing of the electron momentum distribution obtained by two-dimensional angular correlation of the electron-positron annihilation radiation technique on untwinned YBa2Cu3O(7-delta) single crystals are reported. Two distinct signatures of the sheet of Fermi surface related to the CuO chains (the ridge) are resolved. The first occurs at second Umklapp processes, in agreement with previous evidence. The second one, identified for the first time, occurs at third Umklapp processes. Comparison with FLAPW calculations confirms this result. DOE

ADSORPTION AND DESORPTION STUDIES OF CESIUM ON SAPPHIRE SURFACES
K. R. Zavadil and J. L. Ing (AEA Technology, Albuquerque, NM.) 1993 8 p Presented at the 11th Symposium on Space Nuclear Power Systems, Albuquerque, NM, 9-13 Jan. 1994
(Contract DE-AC04-94AL-85000)
(DE94-003798; SAND-93-2545C; CONF-940101-27) Avail: CASI HC A02/MF A01

Adsorption/desorption were studied using combined surface analytical techniques. An approximate initial sticking coefficient for Cs on sapphire was measured using reflection mass spectrometry and found to be 0.9. Thermal desorption mass spectrometry (TDMS) and auger electron spectroscopy (AES) were used to verify that a significant decrease in sticking coefficient occurs as the Cs coverage reaches a critical submonolayer value. TDMS analysis demonstrates that Cs is stabilized on a clean sapphire surface at temperatures (1200 K) in excess of the temperatures experienced by sapphire in a TOPAZ-2 thermionic fuel element (TFE). Surface contaminants on sapphire can enhance Cs adsorption relative to the clean surface. C contamination eliminates the high temperature state of Cs desorption found on clean sapphire but shifts the bulk of the Cs desorption from 400 to 620 K. Surface C is a difficult contaminant to remove from sapphire, requiring annealing above 1400 K. Whether Cs is stabilized on sapphire in a TFE environment will most likely depend on relation between surface contamination and surface structure. DOE

BIEXCITON FORMATION BY TWO-PHOTON ABSORPTION IN QUANTUM WELLS
A. R. Hassan Sep. 1992 7 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-613551; IC-92/222) Avail: CASI HC A02 (US Sales Only)

Direct creation of biexciton states by two-photon absorption in quantum well structure semiconductors is investigated theoretically. The two-photon transition rate to biexciton as a final state is analytically calculated for both photon polarization configurations. The biexciton matrix element has been estimated adopting a more accurate variational parameters wave functions. A numerical application for GaAs Quantum Well (QW) shows that the biexciton two-photon absorption coefficient, alpha(sup 2) (bie(chi)) for both polarization is enhanced over the exciton two-photon absorption coefficient, alpha(sup 2) (e(chi)), by an order of magnitude. This enhancement is, essentially, found to arise from the resonance effect and the structure of the matrix elements involved in the two processes. Furthermore, alpha(sup 2) (bie(chi)), in GaAs QW is four order of magnitude larger than alpha(sup 2) (bie(chi)) in bulk GaAs. This large increase is due to the spatial confinement of the carriers in the QW. DOE

TOPOLOGICAL AMPLITUDES IN STRING THEORY
I. Antoniadis (Ecole Polytechnique, Palaiseau, France.), E. Gava, K. S. Narain, and T. R. Taylor (Northeastern Univ., Boston, MA.) Jul. 1993 33 p
(DE94-601561; IC-93/202; NUB-3071; CPTH-A258/0793) Avail: CASI HC A03/MF A01 (US Sales Only)

It was shown that certain type II string amplitudes at genus g are given by the topological partition F(sub g) discussed recently by Bershadsky, Cecotti, Ooguri and Vafa. These amplitudes give rise to a term in the four-dimensional effective action of the form Sigma(sub g)F(sub g)W(sup 2g), where W is the chiral superfield of N = 2 supergravitational multiplet. The holomorphic anomaly of F(sub g) is related to non-localities of the effective action due to the propagation of massless states. This result generalizes the holomorphic anomaly of the one loop case which is known to lead to non-harmonic gravitational couplings. DOE

ON STRING THEORY INTERACTING WITH TWO-DIMENSIONAL GRAVITY
I. L. Buchbinder (Tomsk State Univ., USSR.), I. L. Shapiro, and A. G. Sibiryakov (Tomsk State Univ., USSR.) Jul. 1993 11 p
(DE94-601562; IC-93/206) Avail: CASI HC A03/MF A01 (US Sales Only)

The approach to the unification of the string theory and the two-dimensional gravity is proposed. It is shown that, up to the one-loop order, the nonlinear D-dimensional sigma-model coupled to the induced local quantum gravity is equivalent to some special (renormalizable) D + 2-dimensional nonlinear sigma-model on the classical gravitational background. The requirement of the Weyl invariance of the effective action leads to some consistency equations for the D + 2-model background fields. These equations may be reduced to the equations for the D-dimensional-sigma-model. DOE

ASPECTS OF NONRENORMALIZABLE TERMS IN A SUPERSTRING STANDARD-LIKE MODELS
Alon E. Faraggi Jun. 1992 28 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-614530; WIS-PH-92-48; SLAC-PUB-5845) Avail: CASI HC A03 (US Sales Only)

I investigate the role of nonrenormalizable terms, up to order N=8, in a superstring derived standard-like model. I argue that nonrenormalizable terms restrict the gauge symmetry, at the Planck scale, to be SU(3)xSU(2)xU(1)(sub B-L)xU(1)(sub T(sub 3R)) rather than SU(3)xSU(2)xU(1)(sub Y). I show that the breaking the gauge symmetry directly to the Standard Model leads to breaking the supersymmetry at the Planck scale, or to dimension four, baryon and lepton violating, operators. I show that if the gauge symmetry is broken directly to the Standard Model the cubic level solution to the F and D flatness constraints is violated by higher order terms, while if U(1)(sub Z') remains unbroken at the Planck scale, the cubic level solution is valid to all orders of nonrenormalizable terms. I discuss the Higgs and fermion mass spectrum. I demonstrate that realistic, hierarchical, fermion mass spectrum can be generated in this model. DOE

VORTICES IN CURVED SPACETIME
J. D. Edelstein, F. A. Schaposnik, and G. Lozano Jul. 1993 11 p
(DE94-601559; IC-93/185) Avail: CASI HC A03/MF A01 (US Sales Only)

We study an Abelian Higgs model coupled to a background metric. We find Bogomol'nyi equations when the coupling is achieved through an R(phi)(sup 2) term (R being the scalar curvature and phi the Higgs scalar). Remarkably, these equations coincide with those arising in models where the gauge field dynamics is governed by a Chern-Simons term so that vortex solutions in our system can be related to self-dual Chern-Simons vortices. COMPONENT STRUCTURE OF THE N = 2 SUPER-YANG-MILLS THEORY IN THE HARMONIC SUPERSPACE
A. A. Maslikov and G. G. Volkov 1992 14 p
(DE93-634340; IHEP-OTF-92-100) Avail: CASI HC A03/MF A01 (US Sales Only)

The specific features of massless and massive N=2 super-Yang-Mills theories are studied. In the frame of the harmonic superspace formalism, the component of the superstrength and free Lagrangian of the vector multiplet will be found without fixing a concrete supergauge for the Abelian case. Starting with the Abelian superstrength, find the form of the non-Abelian superstrength in the first order of the coupling constant g, not fixing the supergauge. In conclusion the approach analogous to the Stueckelberg method, was used to obtain the component Lagrangian of the massive N=2 Yang-Mills theory in the first order of the couplig constant g. DOE

QUANTUM GROUP AND MANIN PLANE RELATED TO A COLORED BRAID GROUP REPRESENTATION
B. Basu-Mallick Jul. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601509; IC-93/219) Avail: CASI HC A03 (US Sales Only)

By considering 'colored' braid group representation, a quantum group was obtained, which reduces to the standards GL(sub q)(2) and GL(sub pq)(2) cases at some particular limits of the 'color' parameters. In spite of quite complicated nature, all of these new quantum group relations can be expressed neatly in the Heisenberg-Weyl form, for a nontrivial choice of the basis elements. Furthermore, it is possible to associate invariant Manin planes, parametrized by the 'color' variables, with such quantum group structure. DOE

QUANTUM STATISTICAL INFERENCE FOR DENSITY ESTIMATION
R. N. Silver, H. F. Martz, and T. Wallstrom 1993 10 p Presented at the Joint American Statistical Association (ASA), Institute of Mathematics, Statistics, and Biometrics Society Conference, San Francisco, CA, 8-12 Aug. 1993
(Contract W-7405-eng-36)
(DE94-002625; LA-UR-93-3552; CONF-9308107-4) Avail: CASI HC A02/MF A01

A new penalized likelihood method for non-parametric density estimation is proposed, which is based on a mathematical analogy to quantum statistical physics. The mathematical procedure for density estimation is related to maximum entropy methods for inverse problems; the penalty function is a convex information divergence enforcing global smoothing toward default models, positivity, extensivity and normalization. The novel feature is the replacement of classical entropy by quantum entropy, so that local smoothing may be enforced by constraints on the expectation values of differential operators. Although the hyperparameters, covariance, and linear response to perturbations can be estimated by a variety of statistical methods, we develop the Bayesian interpretation. The linear response of the MAP estimate is proportional to the covariance. The hyperparameters are estimated by type-II maximum likelihood. The method is demonstrated on standard data sets. DOE

A NOTE ON RIEMANNIAN 2-SPACE
M. S. Rahman Jul. 1993 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-602560; IC-93/161) Avail: CASI HC A02 (US Sales Only)

A variety of the leading properties of a Riemannian two-space is furnished. The reason why a Ricci flat two-space may be looked upon as a flat space is given. It is established that the Ricci tensor is semi-covariantly constant and that the tensor satisfies a covariantly differential equation or its equivalent an ordinary one with the condition, similar to the latter, involving the derivatives of the components of the fundamental tensors. The necessity and sufficiency of the conditions for the scalar curvature to be constant and for the covariant derivative of a vector to be commutative are found. DOE

QCD CORRECTIONS TO INCLUSIVE B - S PROCESSES IN THE STANDARD MODEL Ph.D. Thesis
Mark M. Sutherland 6 Oct. 1989 138 p
(ISBN-0-315-54572-0; CTN-94-60975) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The quark-level decays b yields s gamma and b yields s e+ e- are loop induced processes in the Standard Model. They are therefore potentially sensitive to the presence of the top quark as well as to many kinds of new physics beyond that model. The effect of short-distance strong interaction corrections can be large, and a calculation of these leading logarithmic corrections is presented. Three issues of theoretical interest are discussed in detail. First, an examination is made of the validity of applying equations of motion to certain effective operators at an early stage, in order to reduce the size of the operator bias. It is shown that the equations of motion are indeed commutative with renormalization group scaling. Second, a full computation is performed that includes all contributions to the b yields s gamma process which arise from the b yields s gluon process via operator mixing. It is found that all such effects are indeed negligible and that the b yields s gluon process is strongly supported by quantum chromodynamics (QCD). Third, dimensional reduction is proposed as an alternative to dimensional regularization. QCD corrections using both techniques show that results differ. A four dimensional method is discovered by which the discrepancy is resolved in favor of dimensional regularization. Author (CISTI)

ASPECTS OF PERTURBATIVE CORRECTIONS IN QUANTUM CHROMODYNAMICS Ph.D. Thesis
Stavros Papadopoulos Dec. 1989 189 p
(ISBN-0-315-63607-6; CTN-94-60965) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The perturbative regime of quantum chromodynamics (QCD) is considered, and certain aspects related with higher order corrections (HOC) are studied. Certain large correction terms in the perturbative expansion are determined, in particular, for large transverse momentum direct photon production. The origin of these terms is specified and simple forms called K-factors are provided (soft gluon approach). Furthermore, for processes initiated by 2-2 particle subprocesses, the structure of the complete HOC is analyzed. It is shown that when structure functions and/or fragmentation functions are involved, there is a gauge invariant part that dominates HOC over a sizable kinematic range. Simple and general expressions are derived, allowing an easy calculation of this part. It is also shown that under certain approximations, this part reduces to the form of the simple K-factors. Other aspects of HOC, particularly the dependence on the choice of scales, are considered. Using complete HOC, detailed analysis of recent and old data on large transverse momentum direct photon production is performed. The dependence of the form of the gluon distribution on the choice of the scales is discussed. It is concluded that appreciable ambiguity in this distribution still remains. Author (CISTI)

A VARIATIONAL APPROACH TO THE QUANTUM FIELD THEORETIC BOUND-STATE PROBLEM Ph.D. Thesis
William Peter Dykshoorn Sep. 1990 80 p
(ISBN-0-315-60960-5; CTN-94-60968) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The bound-state problem in quantum field theory provides a stringent test of ideas about the nature of particle interactions. Most calculational schemes have relied on perturbative methods where an expansion parameter of small magnitude was used. With the advent of quantum chromodynamics (QCD), it quickly became apparent that traditional methods would not suffice to calculate the spectrum of the theory. The variational method was applied to the two-particle bound-state problem in quantum electrodynamics. The coupling constant is allowed to become large in order to study the bound states in the ultra relativistic region. Coupled nonperturbative integral equations are developed variationally and solved numerically. The ansatz does not initially contain explicit photon degrees of freedom, but by systematically improving the calculation they are incorporated. In the latter case, the resulting equations, when perturbatively reduced, yield the correct coefficients. The eigenvalue curves show parity doubling in the spectrum in the ultra relativistic region, pointing to the fact that the massive theory behaves as a massless one in this region. The large spin-dependent splittings which appear in the spectrum are of interest as they are present in the highly relativistic bound systems of QCD. Author (CISTI)

FINITE DENSITY EFFECTS IN GAUGE THEORIES Ph.D. Thesis
Andre Roberge Jan. 1989 118 p
(ISBN-0-315-50637-7; CTN-94-60970) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

Various effects of finite fermionic densities in gauge theories are studied. The phase structure of SU(N) gauge theories with fermions as a function of imaginary chemical potential is related to the confining properties of the theory. This phase structure is controlled by a remnant of the Z(N) symmetry which is present in the absence of fermions. At high temperature, the theory has a first-order phase transition as a function of imaginary chemical potential. This transition is expected to be absent in the low-temperature phase. It is shown that properties of the theory at nonzero fermion density can be deduced from its behavior at finite imaginary chemical potential. Anomalies in gauge theories are introduced using various two-dimensional models. In particular, the chiral Schwinger model is shown to be consistent despite being anomalous. The effects of finite densities in anomalous gauge theories are investigated. It is found that, contrary to some recent claims, an effective Hamiltonian (obtained by integrating out the fermions) cannot be obtained by the simple inclusion of a Chern-Simons term multiplying the fermionic chemical potential. The importance of dynamical effects is stressed and a mechanism for producing primordial magnetic field is suggested. Author (CISTI)

SOLUTION OF THE HEISENBERG EQUATION FOR THE FOUR-FERMION CONTACT INTERACTION BY THE METHOD OF DYNAMICAL MAPPINGS

A. N. Vall (Irkutsk State Univ., USSR.), V. M. Leviant (Irkutsk State Univ., USSR.), and A. V. Sinitskaya (Irkutsk State Univ., USSR.) 1992 22 p
(DE94-606341; JINR-E-2-92-497) Avail: CASI HC A03/MF A01 (US Sales Only)

The paper considers the non-relativistic analog of the Nambu-Jona-Lasinio model and demonstrates, by this most simplified example, the method of dynamical mappings of Heisenberg fields on physical fields. The expressions for one particle eigen-excitation spectrum of full Hamiltonian (spectrum of clad fermions), the wave function of two excitations bound state and its mass, and the Bethe-Solpither amplitude are obtained. The relation for the density of vacuum energy is derived as well as a function of mapping parameters. The minimization of energy leads to the fixation of these parameters. The method admits the generalization of the relativistic case.

SYSTEMATIC PROPULSION OPTIMIZATION TOOLS (SPOT) c61

Mark Bower and John Celestian *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 3-5 (For primary document see N94-25665 07-80)
Avail: CASI HC A01/MF A04

This paper describes a computer program written by senior-level Mechanical Engineering students at the University of Alabama in Huntsville which is capable of optimizing user-defined delivery systems for carrying payloads into orbit. The custom propulsion system is designed by the user through the input of configuration, payload, and orbital parameters. The primary advantages of the software, called Systematic Propulsion Optimization Tools (SPOT), are a user-friendly interface and a modular FORTRAN 77 code designed for ease of modification. The optimization of variables in an orbital delivery system is of critical concern in the propulsion environment. The mass of the overall system must be minimized within the maximum stress, force, and pressure constraints. SPOT utilizes the Design Optimization Tools (DOT) program for the optimization techniques. The SPOT program is divided into a main program and five modules: aerodynamic losses, orbital parameters, liquid engines, solid engines, and nozzles. The program is designed to be upgraded easily and expanded to meet specific user needs. A user's manual and a programmer's manual are currently being developed to facilitate implementation and modification.

AUTONOMOUS SPACE PROCESSOR FOR ORBITAL DEBRIS ADVANCED DESIGN PROJECT IN SUPPORT OF SOLAR SYSTEM EXPLORATION c18

Kumar Ramohalli, Dominique Mitchell, Brett Taft, Paul Chinnock, and Bjoern Kutz *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 6-17 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

This paper is regarding a project in the Advanced Design Program at the University of Arizona. The project is named the Autonomous Space Processor for Orbital Debris (ASPOD) and is a NASA/Universities Space Research Association (USRA) sponsored design project. The development of ASPOD and the students' abilities in designing and building a prototype spacecraft are the ultimate goals of this project. This year's focus entailed the development of a secondary robotic arm and end-effector to work in tandem with an existent arm in the removal of orbital debris. The new arm features the introduction of composite materials and a linear drive system, thus producing a light-weight and more accurate prototype. The main characteristic of the end-effector design is that it incorporates all of the motors and gearing internally, thus not subjecting them to the harsh space environment. Furthermore, the arm and the end-effector are automated by a control system with positional feedback. This system is composed of magnetic and optical encoders connected to a 486 PC via two servo-motor controller cards. Programming a series of basic routines and sub-routines has allowed the ASPOD prototype to become more autonomous. The new system is expected to perform specified tasks with a positional accuracy of 0.5 cm.

HARDWARE DESIGN OF A GRAPPLING/DOCKING DEVICE ACCOMMODATING LARGE LATERAL AND ANGULAR MISALIGNMENTS c37

Myles Baker *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 18-19 (For primary document see N94-25665 07-80)
Avail: CASI HC A01/MF A04

In this hardware project, continued from last year, the students developed ideas for a new grappling and docking mechanism that would be able to accommodate a very large initial misalignment (up to one half of the spacecraft radius) and simultaneously a large angular misalignment (up to 20 degrees) between space tug and space vehicle. The students were made familiar with the project by visiting TRW, where they could study the prototype of the NASA Orbiting Maneuvering Vehicle (OMV, since canceled). The students' objective was to design a model, built in the University machine shop, that would demonstrate the potential for much larger misalignments than was possible with the OMV.

HARDWARE DESIGN OF A SPHERICAL MINI-ROVER c37

John Tarlton *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 19-21 (For primary document see N94-25665 07-80)
Avail: CASI HC A01/MF A04

In this hardware project the students designed the prototype of a novel mini-rover for the exploration of a planetary surface. In an actual application, a large number of such miniature roving devices would be released from a landing craft. Each rover would be equipped with a Cd 109 radio-isotope source (a gamma ray emitter) irradiating the planetary surface below the rover, and an x-ray fluorescence detector for a quantitative assay of high atomic weight elements in the planet's surface. (Similar, miniaturized, hand-held devices have recently been developed for use in gold mines). The device developed by the students was limited to demonstrating the mechanical and electrical drive. The geometric external shape is a sphere; hence there is no danger of the rover being turned on its back and stopped. Propulsion is by means of an interior mass, eccentric to the sphere and driven by an electric motor. In an inter-disciplinary effort in mechanical and electrical engineering, the students designed the mechanical parts, built the transistorized circuit board, and tested the device. Author

MANNED MISSION TO MARS WITH PERIODIC REFUELING FROM ELECTRICALLY PROPELLED TANKERS **c12**

Laura Gogan, Joseph Melko, Fritz Wang, Daniel Lourme, Sophie Ben Moha, Christele Lardon, and Muriel Richard *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 22-30 Prepared in cooperation with Ecole Polytechnique Feminine, Sceaux, France (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

In a joint study by students from the Ecole Polytechnique Feminine, France, and the University of California, Los Angeles, a mission concept that had the objective of evaluating the feasibility of a non-nuclear, yet fast, manned mission to Mars was considered. Ion-engine propelled tankers are postulated that would provide mid-coarse refueling of LOX and LH2 to the manned ship. The scenario is therefore one of a 'split mission', yet with the added feature that the cargo ships include tankers for mid-course refueling. The present study is a continuation of one first conducted last year. Emphasis this year was on the design of the tanker fleet. Author

ASSURED CREW RETURN VEHICLE POST LANDING CONFIGURATION DESIGN AND TEST **c18**

Loren A. Anderson and Pamela Kay Armitage *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 31-39 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

The 1991-1992 senior Mechanical and Aerospace Engineering Design class continued work on the post landing configurations for the Assured Crew Return Vehicle (ACRV) and the Emergency Egress Couch (EEC). The ACRV will be permanently docked to Space Station Freedom, fulfilling NASA's commitment of Assured Crew Return Capability in the event of an accident or illness aboard Space Station Freedom. The EEC provides medical support and a transportation surface for an incapacitated crew member. The objective of the projects was to give the ACRV Project Office data to feed into their feasibility studies. Four design teams were given the task of developing models with dynamically and geometrically scaled characteristics. Groups one and two combined effort to design a one-fifth scale model of the Apollo Command Module derivative, an on-board flotation system, and a lift attachment point system. This model was designed to test the feasibility of a rigid flotation and stabilization system and to determine the dynamics associated with lifting the vehicle during retrieval. However, due to priorities, it was not built. Group three designed a one-fifth scale model of the Johnson Space Center (JSC) benchmark configuration, the Station Crew Return Alternative Module (SCRAM) with a lift attachment point system. This model helped to determine the flotation and lifting characteristics of the SCRAM configuration. Group four designed a full scale EEC with changeable geometric and dynamic characteristics. This model provided data on the geometric characteristics of the EEC and on the placement of the CG and moment of inertia. It also gave the helicopter rescue personnel direct input to the feasibility study. Author

AUTONOMOUS SUPPORT FOR MICROORGANISM RESEARCH IN SPACE **c51**

M. W. Luttges, D. M. Klaus, M. L. Fleet, M. S. Miller, D. E. Shipley, and J. D. Smith *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 40-52 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

A preliminary design for performing on-orbit, autonomous research on microorganisms and cultured cells/tissues is presented. An understanding of gravity and its effects on cells is crucial for space exploration as well as for terrestrial applications. The payload is designed to be compatible with the COMmercial Experiment Transported (COMET) launch vehicle, an orbiter middeck locker interface, and with Space Station Freedom. Uplink/downlink capabilities and sample return through controlled reentry are available for all carriers. Autonomous testing activities are preprogrammed with inflight reprogrammability. Sensors for monitoring temperature, pH, light, gravity levels, vibration, and radiation are provided for environmental regulation and experimental data collection. Additional experiment data acquisition includes optical density measurement, microscopy, video, and file photography. Onboard full data storage capabilities are provided. A fluid transfer mechanism is utilized for inoculation, sampling, and nutrient replenishment of experiment cultures. In addition to payload design, representative experiments were developed to ensure scientific objectives remained compatible with hardware capabilities. The project is defined to provide biological data pertinent to extended duration crewed space flight including crew health issues and development of a Controlled Ecological Life Support System (CELSS). In addition, opportunities are opened for investigations leading to commercial applications of space, such as pharmaceutical development, modeling of terrestrial diseases, and material processing. Author

BIOREGENERATIVE SYSTEM COMPONENTS FOR MICROGRAVITY **c51**

Gale E. Nevill, Jr. and Michael I. Hessel, Jr. *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 53-66 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

The goal of the class was to design, fabricate, and test prototype designs that were independent, yet applicable to a Closed Loop Life Support System. The three prototypes chosen were in the areas of agar plant growth, regnerative filtration, and microgravity food preparation. The plant growth group designed a prototype agar medium growth system that incorporates nutrient solution replenishment and post-harvest refurbishment. In addition, the unit emphasizes material containment and minimization of open interfaces. The second project was a filter used in microgravity that has the capability to clean itself. The filters are perforated plates which slide through a duct and are cleaned outside of the flow with a vacuum system. The air in the duct is prevented from flowing outside of the duct by a network of sliding seals. The food preparation group developed a device which dispenses and mixes ingredients and then cooks the mixture in microgravity. The dry ingredients are dispensed from a canister by a ratchet-operated piston. The wet ingredients are dispensed from plastic bags through tubing attached to a syringe. Once inside the mixing chamber, the ingredients are mixed using a collapsible whisk and then pushed into the cooking device. Author

THE EXTENDED MISSION ROVER (EMR) **c12**

W. Shields, Anthony Halecki, Manh Chung, Ken Clarke, Kevin Frankle, Fariba Kassemkhani, John Kuhlhoff, Josh Lenzini, David Lobdell, and Sam Morgan et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 67-73 Prepared in cooperation with Florida State Univ., Tallahassee (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

A key component in ensuring America's status as a leader in the global community is its active pursuit of space exploration. On the twentieth anniversary of Apollo 11, President George Bush challenged the nation to place a man on the moon permanently and to conduct human exploration of Mars in the 21st century. The students of the FAMU/FSU College of Engineering hope to make a significant contribution to this challenge, America's Space Exploration Initiative (SEI), with their participation in the NASA/USRA Advanced Design Program. The project selected by the 1991/1992 Aerospace Design group is the design of an Extended Mission Rover (EMR) for use on the lunar surface. This vehicle will serve as a mobile base to provide future astronauts with a 'shirt-sleeve' living and working environment. Some of the proposed missions are planetary surface exploration, construction and maintenance, hardware setup, and in situ resource experimentation. This vehicle will be put into use in the 2010-2030 time frame. Author

THE ENABLER: A CONCEPT FOR A LUNAR WORK VEHICLE c37
James W. Brazell, Craig Campbell, Ken Kaser, James A. Austin, Clark Beard, Glenn Ceniza, Thomas Hamby, Anne Robinson, and Dana Wooters *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 74-79 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

The Enabler is an earthbound prototype designed to model an actual lunar work vehicle and is able to perform many of the tasks that might be expected of a lunar work vehicle. The vehicle will be constructed entirely from parts made by students and from standard stock parts. The design utilizes only four distinct chassis pieces and sixteen moving parts. The Enabler has non-orthogonal articulating joints that give the vehicle a wide range of mobility and reduce the total number of parts. Composite wheels provide the primary suspension system for the vehicle. Author

DESIGN FOR PRODUCING FIBERGLASS FABRIC IN A LUNAR ENVIRONMENT c31
Rafer M. Benson, Dana R. Causby, Michael C. Johnson, Mark A. Storey, Dai T. Tran, and Thomas A. Zahr *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 80-85 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

The purpose of this project was to design a method of producing a fabric material on the lunar surface from readily available glass fibers. Various methods for forming fabrics were analyzed to determine which methods were appropriate for the lunar conditions. A nonwoven process was determined to be the most suitable process for making a fabric material out of fiberglass under these conditions. Various resins were considered for adhering the fibers. A single thermoplastic resin (AURUM) was found to be the only applicable resin. The end product of the process was determined to be suitable for use as a roadway surfacing material, canopy material, reflective material, or packaging material. A cost analysis of the lunar process versus shipping the end-product from the Earth suggests that the lunar formation is highly feasible. A design for a lunar, nonwoven process was determined and is included. Author

LUNAR PREFORM MANUFACTURING c31
Gregory N. Leong, Sandra Nease, Vicky Lager, Raffy Yaghjian, and Chris Waller *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 86-90 (For primary document see N94-25665 07-80)
Avail: CASI HC A01/MF A04

A design for a machine to produce hollow, continuous fiber-reinforced composite rods of lunar glass and a liquid crystalline matrix using the pultrusion process is presented. The glass fiber will be produced from the lunar surface, with the machine and matrix being transported to the moon. The process is adaptable to the low gravity and near-vacuum environment of the moon through the use of a thermoplastic matrix in fiber form as it enters the pultrusion process. With a power consumption of 5 kW, the proposed machine will run unmanned continuously in fourteen-day cycles, matching the length of lunar days. A number of dies could be included that would allow the machine to produce rods of varying diameter, I-beams, angles, and other structural members. These members could then be used for construction on the lunar surface or transported for use in orbit. The benefits of this proposal are in the savings in weight of the cargo each lunar mission would carry. The supply of glass on the moon is effectively endless, so enough rods would have to be produced to justify its transportation, operation, and capital cost. This should not be difficult as weight on lunar mission is at a premium. Author

VARIABLE SPEED CONTROLLER c54
Christa Estes, Charles Spiggle, Shannon Swift, Stephen VanGeffen, and Frank Younger *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 90-95 (For primary document see N94-25665 07-80)
Avail: CASI HC A01/MF A04

This report details a new design for a variable speed controller which can be used to operate lunar machinery without the astronaut using his or her upper body. In order to demonstrate the design, a treadle for an industrial sewing machine was redesigned to be used by a standing operator. Since the invention of an electrically powered sewing machine, the operator has been seated. Today, companies are switching from sit down to stand up operation involving modular stations. The old treadle worked well with a sitting operator, but problems have been found when trying to use the same treadle with a standing operator. Emphasis is placed on the ease of use by the operator along with the ergonomics involved. Included with the design analysis are suggestions for possible uses for the speed controller in other applications. Author

ENABLER OPERATOR STATION c54
Andrea Bailey, John Kietzman, Shirlyn King, Rae Stover, and Torsten Wegner *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 96-10 (For primary document see N94-25665 07-80)
Avail: CASI HC A01/MF A04

The objective of this project was to design an onboard operator station for the conceptual Lunar Work Vehicle (LWV). The LWV would be used in the colonization of a lunar outpost. The details that follow, however, are for an Earth-bound model. The operator station is designed to be dimensionally correct for an astronaut wearing the current space shuttle EVA suit (which include life support). The proposed operator station will support and restrain an astronaut as well as to provide protection from the hazards of vehicle rollover. The threat of suit puncture is eliminated by rounding all corners and edges. A step-plate, located at the front of the vehicle, provides excellent ease of entry and exit. The operator station weight requirements are met by making efficient use of rigid members, semi-rigid members, and woven fabrics. Author

DUST CONTROL FOR ENABLER c54
Kevin Hilton, Chad Karl, Mark Litherland, David Ritchie, and Nancy Sun *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 101-107 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

The dust control group designed a system to restrict dust that is disturbed by the Enabler during its operation from interfering with astronaut or camera visibility. This design also considers the many different wheel positions made possible through the use of artinuation joints that provide the steering and wheel pitching for the Enabler. The system uses a combination of brushes and fenders to restrict the dust when the vehicle is moving in either direction and in a turn. This design also allows for ease of maintenance as well as accessibility of the remainder of the vehicle. Author

PLANETARY SURFACE EXPLORATION MESUR/AUTONOMOUS LUNAR ROVER **c37**
Larry Stauffer, Matt DiLorenzo, Dave Austin, Raymond Ayers, David Burton, Joe Gaylord, Jim Kennedy, Richard Laux, Dale Lentz, and Preston Nance et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 124-136 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

Planetary surface exploration micro-rovers for collecting data about the Moon and Mars have been designed by the Department of Mechanical Engineering at the University of Idaho. The goal of both projects was to design a rover concept that best satisfied the project objectives for NASA/Ames. A second goal was to facilitate student learning about the process of design. The first micro-rover is a deployment mechanism for the Mars Environmental Survey (MESUR) Alpha Particle/Proton/X-ray (APX) Instrument. The system is to be launched with the 16 MESUR landers around the turn of the century. A Tubular Deployment System and a spiked-legged walker have been developed to deploy the APX from the lander to the Martian Surface. While on Mars, the walker is designed to take the APX to rocks to obtain elemental composition data of the surface. The second micro-rover is an autonomous, roving vehicle to transport a sensor package over the surface of the moon. The vehicle must negotiate the lunar terrain for a minimum of one year by surviving impacts and withstanding the environmental extremes. The rover is a reliable track-driven unit that operates regardless of orientation that NASA can use for future lunar exploratory missions. This report includes a detailed description of the designs and the methods and procedures which the University of Idaho design teams followed to arrive at the final designs. Author

AUTOMATION OF CLOSED ENVIRONMENTS IN SPACE FOR HUMAN COMFORT AND SAFETY **c54**
Allen C. Cogley and Nathan P. Tucker *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 137-145 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

For prolonged missions into space and colonization outside the Earth's atmosphere, development of Environmental Control and Life Support Systems (ECLSS) are essential to provide astronauts with habitable environments. The Kansas State University Advanced Design Team have researched and designed a control system for an ECLSS like that on Space Station Freedom. The following milestones have been accomplished: (1) completed computer simulation of the CO2 Removal Assembly; (2) created a set of rules for the expert control system of the CO2 Removal Assembly; (3) created a classical controls system for the CO2 Removal Assembly; (4) established a means of communication between the mathematical model and the two controls systems; and (5) analyzed the dynamic response of the simulation and compared the two methods of control. MINOTAUR (MARYLAND'S INNOVATIVE ORBITAL TECHNOLOGICALLY ADVANCED UNIVERSITY ROCKET) **c20**
Mark J. Lewis, Dave Akin, Charles Lind, T. Rice, ed., and W. Vincent, ed. *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 146-158 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

Over the past decade, there has been an increasing interest in designing small commercial launch vehicles. Some of these designs include OSC's Pegasus, and AMROC's Aquila. Even though these vehicles are very different in their overall design characteristics, they all share a common thread of being expensive to design and manufacture. Each of these vehicles has an estimated production and operations cost of over $15000/kg of payload. In response to this high cost factor, the University of Maryland is developing a cost-effective alternative launch vehicle, Maryland's Innovative Orbital Technologically Advanced University Rocket (MINOTAUR). A preliminary cost analysis projects that MINOTAUR will cost under $10000/kg of payload. MINOTAUR will also serve as an enriching project devoted to an entirely student-designed-and-developed launch vehicle. This preliminary design of MINOTAUR was developed entirely by undergraduates in the University of Maryland's Space Vehicle Design class. At the start of the project, certain requirements and priorities were established as a basis from which to begin the design phase: (1) carry a 100 kg payload into a 200 km circular orbit; (2) provide maximum student involvement in the design, manufacturing, and launch phases of the project; and (3) use hybrid propulsion throughout. The following is the list of the project's design priorities (from highest to lowest): (1) safety, (2) cost, (3) minimum development time, (4) maximum use of the off-the-shelf components, (5) performance, and (6) minimum use of pyrotechnics. THE 1991-1992 WALKING ROBOT DESIGN **c37**
Shapour Azarm, Wijesurija Dayawansa, Lung-Wen Tsai, and Jon Peritt *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 159-169 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

The University of Maryland Walking Machine team designed and constructed a robot. This robot was completed in two phases with supervision and suggestions from three professors and one graduate teaching assistant. Bob was designed during the Fall Semester 1991, then machined, assembled, and debugged in the Spring Semester 1992. The project required a total of 4,300 student hours and cost under $8,000. Mechanically, Bob was an exercise in optimization. The robot was designed to test several diverse aspects of robotic potential, including speed, agility, and stability, with simplicity and reliability holding equal importance. For speed and smooth walking motion, the footpath contained a long horizontal component; a vertical aspect was included to allow clearance of obstacles. These challenges were met with a leg design that utilized a unique multi-link mechanism which traveled a modified tear-drop footpath. The electrical requirements included motor, encoder, and voice control circuitry selection, manual controller manufacture, and creation of sensors for guidance. Further, there was also a need for selection of the computer, completion of a preliminary program, and testing of the robot. Author

PROJECT COLUMBIAD: REESTABLISHMENT OF HUMAN PRESENCE ON THE MOON **c12**
Joseph Shea, Stanley Weiss, Harold Alexander, Peter Belobaba, Greg Loboda, Maresi Berry, Mark Bower, Charles Bruen, Patrick Cazeau, and Michael Clarke et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 170-177 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

In response to the Report of the Advisory Committee on the future of the U.S. Space Program and a request from NASA's Exploration Office, the MIT Hunsaker Aerospace Corporation (HAC) conducted a feasibility study, known as Project Columbiad, on reestablishing human presence on the Moon before the year 2000. The mission criteria established were to transport a four person crew to the lunar surface at any latitude and back to Earth with a 14-28 day stay on the lunar surface. Safety followed by cost of the Columbiad Mission were the top level priorities of HAC. The resulting design has a precursor mission that emplaces the required surface payloads before the piloted mission arrives. Both the precursor and piloted missions require two National Launch System (NLS) launches. Both the precursor and piloted missions have an Earth orbit rendezvous (EOR) with a direct transit to the Moon post-EOR. The piloted mission returns to Earth via a direct transit. Included among the surface payloads preemplaced are a habitat, solar power plant (including fuel cells for the lunar night), lunar rover, and mecanisms used to cover the habitat with regolith (lunar soil) in order to protect the crew members from severe solar flare radiation. PROJECT APEX: ADVANCED MANNED EXPLORATION OF THE MARTIAN MOON PHOBOS **c91**

Joe G. Eisley and Jim Akers *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 178-187 (For primary document see N94-25665 07-80)

Avail: CASI HC A02/MF A04

A preliminary design has been developed for a manned mission to the Martian moon Phobos. The spacecraft is to carry a crew of five and will be launched from Low Earth Orbit in the year 2010. The outbound trajectory to Mars uses a gravitational assisted swingby of Venus and takes eight months to complete. The stay at Phobos is scheduled for 60 days. During this time, the crew will be busily engaged in setting up a prototype fuel processing facility. The vehicle will then return to Earth orbit after a total mission duration of 656 days. The spacecraft is powered by three nuclear thermal rockets which also provide the primary electrical power via dual mode operation. The overall spacecraft length is 110 m, and the total mass departing from Low Earth Orbit is 900 metric tons. Author (revised)

MARS TRANSPORTATION SYSTEM **c37**

William Garrard, Andrew Vano, and Dave Rutherford *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 188-195 (For primary document see N94-25665 07-80)

Avail: CASI HC A02/MF A04

The University of Minnesota Advanced Space Design Program has developed a sample Mars exploration scenario. The purpose of the design project is to enhance NASA and university interaction, to provide fresh ideas to NASA, and to provide real world design problems to engineering students. The Mars Transportation System in this paper is designed to transport a crew of six astronauts to the Martian surface and return them to Low Earth Orbit (LEO) starting in the year 2016. The proposed vehicle features such advanced technologies as nuclear propulsion, nuclear power generation, and aerobraking. Three missions are planned. Orbital trajectories are of the conjunction class with an inbound Venus swingby providing a 60-day surface stay at Mars and an average total trip time of 520 days. Author

PROJECT WISH: THE EMERALD CITY **c20**

Hayrani Oz, Jim Dunne, Stan Butchar, Tommy George, Rob Hellstrom, Tricia Kringen, George Owens, Mike Perrea, Paul Semeraro, and Phil Thorndike *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 196-208 (For primary document see N94-25665 07-80)

Avail: CASI HC A03/MF A04

Phase 3 of Project WISH saw the evolution of the Emerald City (E-City) from a collection of specialized independent analyses and ideas to a working structural design integrated with major support systems and analyses. Emphasis was placed on comparing and contrasting the closed and open cycle gas core nuclear rocket engines to further determine the optimum propulsive system for the E-City. Power and thermal control requirements were then defined and the question of how to meet these requirements was addressed. Software was developed to automate the mission/system/configuration analysis so changes dictated by various subsystem constraints could be managed efficiently and analyzed interactively. In addition, the liquid hydrogen propellant tank was statically designed for minimum mass and shape optimization using a finite element modeling package called SDRC I-DEAS. Spoke and shaft cross-sectional areas were optimized on ASTROS (Automated Structural Optimization System) for mass minimization. A structural dynamic analysis of the optimal structure also conducted using ASTROS enabled a study of the modes, frequencies, displacements, and accelerations of the E-City. Finally, the attitude control system design began with an initial mass moment of inertia analysis and was then designed and optimized using linear quadratic regulator control theory. EXTRATERRESTRIAL SURFACE PROPULSION SYSTEMS **c37**

Robert L. Ash, Dexter L. Blackstock, K. Barnhouse, Z. Charalambous, J. Coats, J. Danagan, T. Davis, J. Dickens, P. Harris, and G. Horner et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 209-215 (For primary document see N94-25665 07-80)

Avail: CASI HC A02/MF A04

Lunar traction systems, Mars oxygen production, and Mars methane engine operation were the three topics studied during 1992. An elastic loop track system for lunar construction operations was redesigned and is being tested. A great deal of work on simulating the lunar environment to facilitate traction testing has been reported. Operation of an oxygen processor under vacuum conditions has been the focus of another design team. They have redesigned the processor facility. This included improved seals and heat shields. Assuming methane and oxygen can be produced from surface resources on Mars, a third design team has addressed the problem of using Mars atmospheric carbon dioxide to control combustion temperatures in an internal combustion engine. That team has identified appropriate tests and instrumentation. They have reported on the test rig that they designed and the computer-based system for acquiring data. Author (revised)

COMET NUCLEUS AND ASTEROID SAMPLE RETURN MISSIONS **c12**

Robert G. Melton, Roger C. Thompson, Thomas F. Starchville, Jr., C. Adams, A. Aldo, K. Dobson, C. Flotta, J. Gagliardino, M. Lear, and C. McMillan et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 216-227 (For primary document see N94-25665 07-80)

Avail: CASI HC A03/MF A04

During the 1991-92 academic year, the Pennsylvania State University has developed three sample return missions: one to the nucleus of comet Wild 2, one to the asteroid Eros, and one to three asteroids located in the Main Belt. The primary objective of the comet nucleus sample return mission is to rendezvous with a short period comet and acquire a 10 kg sample for return to Earth. Upon rendezvous with the comet, a tethered coring and sampler drill will contact the surface and extract a two-meter core sample from the target site. Before the spacecraft returns to Earth, a monitoring penetrator containing scientific instruments will be deployed for gathering long-term data about the comet. A single asteroid sample return mission to the asteroid 433 Eros (chosen for proximity and launch opportunities) will extract a sample from the asteroid surface for return to Earth. To limit overall mission cost, most of the mission design uses current technologies, except the sampler drill design. The multiple asteroid sample return mission could best be characterized through its use of future technology including an optical communications system, a nuclear power reactor, and a low-thrust propulsion system. A low-thrust trajectory optimization code (QuickTop 2) obtained from the NASA LeRC helped in planning the size of major subsystem components, as well as the trajectory between targets. DESIGN AND DEVELOPMENT OF THE SECOND GENERATION MARS HABITAT **c54**

Ikhlas Sabouni, Roy Smith, Steven Taylor, Brock Harrell, and Earnest Crawford *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 228-236 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

The second generation of Mars Habitat is to be utilized as an advanced permanent base for 20 crew members to live on Mars for a period of 6-12 months. It is designed to be a self-contained environment accommodating five main facilities: living, working, service, medical, and a greenhouse. The objective of the design is to create a comfortable, safe, living environment. Hexamars-2 and Lavapolis-2 are two different concepts for the advanced Mars Habitat. The design team assumes there will be an initial habitat located near or on the site from earlier missions that satisfies the requirement for a short-term habitation for the crew to use while constructing Hexamars-2 or Lavapolis-2. Prefabricated structures and materials will be shipped to the site before the long-term crew members arrive. Partial construction and preparation for the long-term habitat will be done by crew members or robotics from a previous mission. The construction of the long-term base will occur in phases. Hexamars-2 consists of six sphere-shaped inflatable modules that will be partially buried below the Martian surface. The construction of each sphere will occur in ten steps. Shape charges will be used to create the crater in which the spherical structure will be placed. The interior core will be unloaded and put into place followed by the exterior structure. The foundation will be filled, the interior bladder will be inflated, floor-to-floor joists connected, and sand pockets filled. Finally, the life support system and interior partitions are put in place. Each sphere consists of three levels of which the lower level will be safe haven. Particular attention is given to structural support, the dominance of internal pressure, the process of construction, and human factors.

FIRST LUNAR OUTPOST **c54**
Aureo F. Andino, Daniel Silva, Nelson Ortiz, Omar Alvarez, Julio A. Colon, Myrelle Colon, Alicia Diaz, Xochiquetzal Y. Escobar, Alberto Garcia, and Isabel C. Gonzalez et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 237-249 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

Design and research efforts at the University of Puerto Rico have focused on the evaluation and refinement of the Habitability Criteria for a prolonged human presence in space during the last four years. Living quarters for a Mars mission and a third generation lunar base concept were proposed. This academic year, 1991-92, work on further refinement of the habitability criteria and design of partial gravity furniture was carried on. During the first semester, design alternatives for furniture necessary in a habitat design optimized for lunar and Martian environments were developed. Designs are based on recent research data from lunar and Mars gravity simulations, and current NASA standards. Artifacts will be submitted to NASA architects to be tested in KC-135 flights. Test findings will be submitted for incorporation in future updates to NASA habitat design standards. Second semester work was aimed at integrating these findings into the First Lunar Outpost (FLO), a mission scenario currently being considered by NASA. The mission consists of a manned return to the moon by crews of four astronauts for periods of 45 days. The major hardware components of the mission are as follows: (1) a Crew Module for the delivery of the crew and their supplies, and (2) the Habitat Module, which will arrive on the Moon unmanned. Our design efforts concentrated on this Habitat Module and on application of habitability criteria. Different geometries for the pressure vessel and their impact on the interior architecture were studied. Upon the selection of a geometry, a more detailed analysis of the interior design was performed, taking into consideration the reduced gravity, and the protection against radiation, micrometeorites, and the extreme temperature variation. A proposal for a FLO was submitted by the students, consisting essentially of a 24-feet (7.3 m.) by 35-feet (10.67 m) high vertical cylinder with work areas, crew quarters, galley, wardroom, leisure facilities, health maintenance, waste management, EVA operations facilities, and safe havens.

THE LIGHTCRAFT PROJECT: FLIGHT TECHNOLOGY FOR A HYPERSONIC MASS TRANSIT SYSTEM Abstract Only **c05**
Leik Myrabo and Kenneth Bouchard *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 250 (For primary document see N94-25665 07-80)
Avail: CASI HC A01/MF A04

Rensselaer Polytechnic Institute has been developing transatmospheric 'Lightcraft' technology aimed at creating an efficient, economically affordable, hypersonic mass transportation system. The system utilizes laser-energized airbreathing engines to accelerate minimum-volume passenger capsules. The system gains a high level of reliability by using remote 'centralized' space power sources, e.g., satellite solar power stations. The most critical portion of the Lightcraft's acceleration trajectory involves flight propulsion at hypersonic velocities within the Earth's atmosphere, using a 'Magneto-Hydro-Dynamic (MHD) Fanjet' mode. Of all the propulsion modes proposed for the Lightcraft's combined-cycle engine, the MHD-Fanjet mode has received the least critical inquiry, largely because of its complexity. During the 1991-1992 academic year, Rensselaer's ADP teams produced a detailed conceptual design for the MHD-Fanjet engine, including the specific details of its integration with the other three propulsive modes. To facilitate this process, students built a full-scale mockup of a 1/12th section of this annular engine, complete with a working model of the shroud translation system. The class also made preliminary design calculations for the double-dipole, 'cuspfield' superconducting magnets that provide the external magnetic field needed by the MHD air accelerator, as well as for an onboard microwave power system to enhance the electrical conductivity of the air plasma working fluid. In addition, a large hypersonic model of the MHD accelerator was designed for future tests in RPI's Hypersonic Shock Tunnel in order to validate present analytical performance models. Another group continued design work on a full-sized prototype of a one-person 'Mercury Lightcraft' (a transatmospheric flight simulator), with major emphasis on the detailed design of the major structure, robotic landing gear, and exterior aeroshell. Integrated Space Systems (ISS) has designed a Low Earth Orbit Assembly Facility for submission in the 1992 AIAA/LORAL Team Space Design Competition. This facility, the Space Habitat, Assembly, and Repair Center (SHARC), will be used to construct, assemble, and service space vehicles. SHARC's primary mission will be the construction of interplanetary vehicles, but it will also be able to perform repair and refueling operations of craft which are in an Earth orbit. This facility has been designed using only present and near-present technology. The emphasis is on minimizing cost.

The Earth is nearing depletion of its natural resources at a time when human beings are rapidly expanding the frontiers of space. The resources possessed by asteroids have enormous potential for aiding and enhancing human space exploration as well as life on Earth. Project STONER (Systematic Transfer of Near Earth Resources) is based on mining an asteroid and transporting raw materials back to Earth. The asteroid explorer/sample return mission is designed in the context of both scenarios and is the first phase of a long range plan for humans to utilize asteroid resources. Project STONER is divided into two parts: asteroid selection and explorer spacecraft design. The spacecraft design team is responsible for the selection and integration of the subsystems: GNC, communications, automation, propulsion, power, structures, thermal systems, scientific instruments, and mechanisms used on the surface to retrieve and store asteroid regolith. The sample return mission scenario consists of eight primary phases that are critical to the mission. Author (revised)

The Department of Mechanical Engineering at The University of Texas at Austin participated in seven cooperative design projects this year. Six of the projects were associated with the Johnson Space Center and include the design of a thermal control system for an inflatable lunar habitat module, a vibration isolation system for a space shuttle cycle ergometer, a radiator shading device for a lunar outpost, a reusable astronaut safety tether, a resistive exercise device for use on the space shuttle, and a fleet of autonomous regolith throwing devices for radiation shielding of lunar habitats. The seventh project is associated with the Jet Propulsion Lab and involves the design of a shock absorbing wheel for a small six-wheeled Martian rover vehicle. Author (revised)

Avail: CASI HC A01/MF A04

Two student groups designed unmanned landers to deliver 200 kilogram payloads to the lunar surface. Payloads could include astronomical telescopes, small lunar rovers, and experiments related to future human exploration. Requirements include the use of existing hardware where possible, use of a medium-class launch vehicle, an unobstructed view of the sky for the payload, and access to the lunar surface for the payload. The projects were modeled after Artemis, a project that the NASA Office of Exploration is pursuing with a planned first launch in 1996. The Lunar Scout design uses a Delta 2 launch vehicle with a Star 48 motor for insertion into the trans-lunar trajectory. During the transfer, the solar panels will be folded inward and the spacecraft will be powered by rechargeable nickel-cadmium batteries. The lander will use a combination of a solid rocket motor and hydrazine thrusters for the descent to the lunar surface. The solar arrays will be deployed after landing. The lander will provide power for operations to the payload during the lunar day; batteries will provide 'stay-alive' power during the lunar night. A horn antenna on the lander will provide communications between the payload and the earth. Author (revised)

Avail: CASI HC A03/MF A04

A low earth orbiting platform for an infrared (IR) sensor payload is examined based on the requirements of a Naval Research Laboratory statement of work. The experiment payload is a 1.5-meter square by 0.5-meter high cubic structure equipped with the imaging system, radiators, and spacecraft mounting interface. The orbit is circular at 509 km (275 nmi) altitude and 70 deg. inclination. The spacecraft is three-axis stabilized with pointing accuracy of plus or minus 0.5 deg. in each axis. The experiment payload requires two 15-minute sensing periods over two contiguous orbit periods for 30 minutes of sensing time per day. The spacecraft design is presented for launch via a Delta 2 rocket. Subsystem designs include attitude control, propulsion, electric power, telemetry, tracking and command, thermal design, structure, and cost analysis. Author (revised)

A current thrust in satellite communication systems considers a low-Earth orbiting constellations of satellites for continuous global coverage. Conceptual design studies have been done at the time of this design project by LORAL Aerospace Corporation under the program name GLOBALSTAR and by Motorola under their IRIDIUM program. This design project concentrates on the spacecraft design of the GLOBALSTAR low-Earth orbiting communication system. Overview information on the program was gained through the Federal Communications Commission licensing request. The GLOBALSTAR system consists of 48 operational satellites positioned in a Walker Delta pattern providing global coverage and redundancy. The operational orbit is 1389 km (750 nmi) altitude with eight planes of six satellites each. The orbital planes are spaced 45 deg., and the spacecraft are separated by 60 deg. within the plane. A Delta 2 launch vehicle is used to carry six spacecraft for orbit establishment. Once in orbit, the spacecraft will utilize code-division multiple access (spread spectrum modulation) for digital relay, voice, and radio determination satellite services (RDSS) yielding position determination with accuracy up to 200 meters. COPERNICUS: LUNAR SURFACE MAPPER **c91**
Frank J. Redd and Shaun D. Anderson *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 298-308 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

The Utah State University (USU) 1991-92 Space Systems Design Team has designed a Lunar Surface Mapper (LSM) to parallel the development of the NASA Office of Exploration lunar initiatives. USU students named the LSM 'Copernicus' after the 16th century Polish astronomer, for whom the large lunar crater on the face of the moon was also named. The top level requirements for the Copernicus LSM are to produce a digital map of the lunar surface with an overall resolution of 12 meters (39.4 ft). It will also identify specified local surface features/areas to be mapped at higher resolutions by follow-on missions. The mapping operation will be conducted from a 300 km (186 mi) lunar-polar orbit. Although the entire surface should be mapped within six months, the spacecraft design lifetime will exceed one year with sufficient propellant planned for orbit maintenance in the anomalous lunar gravity field. The Copernicus LSM is a small satellite capable of reaching lunar orbit following launch on a Conestoga launch vehicle which is capable of placing 410 kg (900 lb) into translunar orbit. Upon orbital insertion, the spacecraft will weigh approximately 233 kg (513 lb). This rather severe mass constraint has insured attention to component/subsystem size and mass, and prevented 'requirements creep.' Transmission of data will be via line-of-sight to an earth-based receiving system. Author (revised)

PROJECT PARAS: PHASED ARRAY RADIO ASTRONOMY FROM SPACE **c89**
Kenneth Nuss, Christopher Hoffmann, Michael Dungan, Michael Madden, and Monia Bendakhlia (Ecole Polytechnique Feminine, Sceaux, France.) *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 309-316 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

An orbiting radio telescope is proposed which, when operated in a very long baseline interferometry (VLBI) scheme, would allow higher than

currently available angular resolution and dynamic range in the maps and the ability to observe rapidly changing astronomical sources. Using passive phased array technology, the proposed design consists of 656 hexagonal modules forming a 150-m diameter antenna dish. Each observatory module is largely autonomous, having its own photovoltaic power supply and low-noise receiver and processor for phase shifting. The signals received by the modules are channeled via fiber optics to the central control computer in the central bus module. After processing and multiplexing, the data are transmitted to telemetry stations on the ground. The truss frame supporting each observatory panel is a novel hybrid structure consisting of a bottom graphite/epoxy tubular triangle and rigidized inflatable Kevlar tubes connecting the top observatory panel and the bottom triangle. Attitude control and station keeping functions will be performed by a system of momentum wheels in the bus and four propulsion modules located at the compass points on the periphery of the observatory dish. Each propulsion module has four monopropellant thrusters and four hydrazine arcjets, the latter supported by either a photovoltaic array or a radioisotope thermoelectric generator. The total mass of the spacecraft is about 20,500 kg.

PRESSURIZED LUNAR ROVER (PLR) c37
Kenneth Creel, Jeffrey Frampton, David Honaker, Kerry McClure, Mazyar Zeinali, Manoj Bhardwaj, Vatsal Bulsara, David Kokan, Shaun Shariff, and Eric Svarverud et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 316-324 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

The objective of this project was to design a manned pressurized lunar rover (PLR) for long-range transportation and for exploration of the lunar surface. The vehicle must be capable of operating on a 14-day mission, traveling within a radius of 500 km during a lunar day or within a 50-km radius during a lunar night. The vehicle must accommodate a nominal crew of four, support two 28-hour EVA's, and in case of emergency, support a crew of six when near the lunar base. A nominal speed of ten km/hr and capability of towing a trailer with a mass of two mt are required. Two preliminary designs have been developed by two independent student teams. The PLR 1 design proposes a seven meter long cylindrical main vehicle and a trailer which houses the power and heat rejection systems. The main vehicle carries the astronauts, life support systems, navigation and communication systems, lighting, robotic arms, tools, and equipment for exploratory experiments. The rover uses a simple mobility system with six wheels on the main vehicle and two on the trailer. The nonpressurized trailer contains a modular radioisotope thermoelectric generator (RTG) supplying 6.5 kW continuous power. A secondary energy storage for short-term peak power needs is provided by a bank of lithium-sulfur dioxide batteries. The life support system is partly a regenerative system with air and hygiene water being recycled. A layer of water inside the composite shell surrounds the command center allowing the center to be used as a safe haven during solar flares. The PLR 1 has a total mass of 6197 kg. It has a top speed of 18 km/hr and is capable of towing three metric tons, in addition to the RTG trailer. The PLR 2 configuration consists of two four-meter diameter, cylindrical hulls which are passively connected by a flexible passageway, resulting in the overall vehicle length of 11 m. The vehicle is driven by eight independently suspended wheels. The dual-cylinder concept allows articulated as well as double Ackermann steering. The primary power of 8 kW is supplied by a dynamic isotope system using a closed Brayton cycle with a xenon-hydrogen mixture as the working fluid. A sodium-sulfur battery serves as the secondary power source. Excess heat produced by the primary power system and other rover systems is rejected by radiators located on the top of the rear cylinder. The total mass of the PLR 2 is 7015 kg. Simplicity and low total weight have been the driving principles behind the design of PLR 1. The overall configuration consists of a 7-m-long, 3-m-diameter cylindrical main vehicle and a two-wheeled trailer. The cylinder of the main body is capped by eight-section, faceted, semi-hemispherical ends. The trailer contains the RTG power source and is not pressurized. The shell of the main body is constructed of a layered carbon fiber/foam/Kevlar sandwich structure. Included in the shell is a layer of water for radiation protection. The layer of water extends from the front of the rover over the crew compartment and creates a safe haven for the crew during a solar flare-up. The carbon fiber provides the majority of the strength and stiffness and the Kevlar provides protection from micrometeoroids. The Kevlar is covered with a gold foil and multi-layer insulation (MLI) to reduce radiation degradation and heat transfer through the wall. A thin thermoplastic layer seals the fiber and provides additional strength.

PROJECT MINERVA: A LOW-COST MANNED MARS MISSION BASED ON INDIGENOUS PROPELLANT PRODUCTION c28
Adam P. Bruckner, Hobie Anderson, Kelly Caviezel, Todd Daggert, Mike Folkers, Mark Fornia, Steven Hamling, Bryan Johnson, Martin Kalberer, and Mike Machula et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 325-342 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

Project Minerva is a low-cost manned Mars mission designed to deliver a crew of four to the Martian surface, using only two sets of two launches. Key concepts which make this mission realizable are the use of near-term technologies and in-situ propellant production, following the senario originally proposed by R. Zubrin of Martin Marietta. The first set of launches delivers two unmanned payloads into low earth orbit (LEO): one consists of an Earth Return Vehicle (ERV), a propellant production plant, and a set of robotic vehicles, and the second consists of the upper stage/trans-Mars injection (TMI) booster. In LEO, the two payloads are joined and inserted into a Mars transfer orbit. The landing on Mars is performed with the aid of multiple aerobraking maneuvers. On the Martian surface, the propellant production plant uses a Sabatier/electrolysis-type process to combine six tons of hydrogen brought from earth with carbon dioxide from the Martian atmosphere to produce 100 tons of liquid oxygen and methane, which are later used as the propellants for the rover expeditions and the manned return journey of the ERV. Once the in-situ propellant production is completed, approximately two years after the first set of launches, the manned portion of the mission leaves earth. This set of two launches is similar to that of the unmanned vehicles; the two payloads are the Manned Transfer Vehicle (MTV) and the upper stage/TMI booster. The MTV contains the manned rover and the habitat which houses the astronauts enroute to Mars and on the Martian surface. During the 180-day trip to Mars, artificial gravity is created by tethering the MTV to the TMI booster and inducing rotation. Upon arrival the MTV performs aerobraking maneuvers to land near the fully-fueled ERV, which will be used by the crew a year and a half later to return to earth. The mission entails moderate travel times with relatively low-energy conjunction-class trajectories and allows ample time for scientific exploration. This set of missions can be repeated every two years in order to continue exploration at a variety of sites and gradually establish the infrastructure for a permanent base on Mars.

PAX: A PERMANENT BASE FOR HUMAN HABITATION OF MARS c54
Gary T. Moore, Patrick J. Rebholz, Joseph P. Fieber, Janis Huebner-Moths, and Kerry L. Paruleski *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 343-357 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

The Advanced Design Program in Space Architecture at the University of Wisconsin-Milwaukee supported the synthesis report and two of its scenarios - 'Architecture 1' and 'Architecture 4' - and the Weaver ExPO report on near-term extraterrestrial explorations during the spring of 1992. The project investigated the implications of different mission scenarios, the Martian environment, supporting technologies, and especially human factors and environment-behavior considerations for the design of the first permanent Martian base. This paper presents the results of that investigation. The paper summarizes site selection, development of habitability design requirements based on environment-behavior research, construction sequencing, and a full concept design and design development for a first permanent Martian base and habitat. The proposed design is presented in terms of an integrative mission scenario and master plan phased through initial operational configuration, base site plan, and design development details of a complete Martian habitat for 18 crew members including all laboratory, mission control, and crew support spaces. MICROGRAVITY IGNITION EXPERIMENT **c29**

Vahid Motevalli, William Elliott, Keith Garrant, and Ryan Marcotte *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 358-364 (For primary document see N94-25665 07-80)

Avail: CASI HC A02/MF A04

The purpose of this project is to develop a flight-ready apparatus of the microgravity ignition experiment for the GASCAN 2 program. The microgravity ignition experiment is designed to study how a microgravity environment affects the time to ignition of a sample of alpha-cellulose paper. A microgravity environment will result in a decrease in the heat transferred from the sample due to a lack of convection currents, which would decrease time to ignition. A lack of convection current would also cause the oxygen supply at the sample not to be renewed, which could delay or even prevent ignition. When this experiment is conducted aboard GASCAN 2, the dominant result of the lack of ignition will be determined. The experiment consists of four canisters containing four thermocouples and a sensor to detect ignition of the paper sample. This year the interior of the canister was redesigned and a mathematical model of the heat transfer around the sample was developed. This heat transfer model predicts an ignition time of approximately 5.5 seconds if the decrease of heat loss from the sample is the dominant factor of the lack of convection currents.

DESIGN OF THE ADVANCED REGIONAL AIRCRAFT, THE DART-75 **c05**

Steve Elliot, Jason Gislason, Mark Huffstetler, Jon Mann, Ashley Withers, and Mark Zimmerman *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 367-373 (For primary document see N94-25665 07-80)

Avail: CASI HC A02/MF A04

The need for regional aircraft stems from the problem of hub airport congestion. Regional travel will allow a passenger to commute from one spoke city to another spoke city without entering the congested hub airport. In addition, those people traveling longer routes may begin the flight at home instead of traveling to the hub airport. At this time, there is no American aerospace company that produces a regional transport for under 100 passengers. The intention of the Developmental Advanced Regional Transport (DART-75) is to fill this void with a modern, efficient regional aircraft. This design achieves the efficiency through a number of advanced features including three lifting surfaces, partial composite construction, and an advanced engine design. Efficiency is not the only consideration. Structural integrity, fatigue life, ease of maintenance, passenger comfort and convenience, and environmental aspects must all be considered. These factors force the design team to face many tradeoffs that are studied to find the best solution. The final consideration that cannot be overlooked is that of cost. The DART-75 is a 75-passenger medium-range regional transport intended for spoke-to-spoke, spoke-to-hub, and some hub-to-hub operations. Included are the general descriptions of the structures, weight and balance, stability and control, performance, and engine design.

EAGLE RTS: A DESIGN OF A REGIONAL TRANSPORT **c05**

Paul Bryer, Jon Buckles, Paul Lemke, and Kirk Peake *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 373-378 (For primary document see N94-25665 07-80)

Avail: CASI HC A02/MF A04

The Eagle RTS (Regional Transport System) is a 66-passenger aircraft designed to satisfy the need for accessible and economical regional travel. The first design objective for the Eagle RTS is safety. Safety results primarily from avoidance of the hub airport air traffic, implementation of anti-stall characteristics by tailoring the canard, and proper positioning of the engines for blade shedding. To provide the most economical aircraft, the Eagle RTS will use existing technology to lower production and maintenance costs by decreasing the amount of new training required. In selecting the propulsion system, the effects on the environment were a main consideration. Two advantages of turbo-prop engines are the high fuel efficiency and low noise levels produced by this type of engine. This ensures the aircraft's usage during times of rising fuel costs and growing aircraft noise restrictions. The design of the Eagle RTS is for spoke-to-spoke transportation. It must be capable of landing on shorter runways and have speeds comparable to that of the larger aircraft to make its service beneficial to the airlines. With the use of turbo-prop engines and high lift devices, the Eagle RTS is highly adaptable to regional airports. The design topics discussed include: aerodynamics, stability, structures and materials, propulsion, and cost.

PRELIMINARY DESIGN OF NINE HIGH SPEED CIVIL TRANSPORTS **c05**

Doral Sandlin, Robert vantRiet, Dani Soban, and Ty Hoang *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 379-390 (For primary document see N94-25665 07-80)

Avail: CASI HC A03/MF A04

Sixty senior design students at Cal Poly, SLO have completed a year-long project to design the next generation of High Speed Civil Transports (HSCT). The design process was divided up into three distinct phases. The first third of the project was devoted entirely to research into the special problems associated with an HSCT. These included economic viability, airport compatibility, high speed aerodynamics, sonic boom minimization, environmental impact, and structures and materials. The result of this research was the development of nine separate Requests for Proposal (RFP) that outlined reasonable yet challenging design criteria for the aircraft. All were designed to be technically feasible in the year 2015. The next phase of the project divided the sixty students into nine design groups. Each group, with its own RFP, completed a Class 1 preliminary design of an HSCT. The nine configurations varied from conventional double deltas to variable geometry wings to a pivoting oblique wing design. The final phase of the project included a more detailed Class 2 sizing as well as performance and stability and control analysis. Cal Poly, San Luis Obispo presents nine unique solutions to the same problem: that of designing an economically viable, environmentally acceptable, safe and comfortable supersonic transport.

SUPERCRUISER ARROW HS-8 **c05**

Paul Lord, Edward Kao, Joey B. Abobo, Todd A. Collins, Leong Ma, Adnan Murad, Hitesh Naran, Thuan P. Nguyen, Timithy I. Nuon, and Dimitri D. Thomas *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 391-405 (For primary document see N94-25665 07-80)

Avail: CASI HC A03/MF A04

Technology in aeronautics has advanced dramatically since the last design of a production High Speed Civil Transport (HSCT) aircraft. Newly projected requirements call for a new High Speed Civil Transport aircraft with a range of approximately 550 nm and at least 275 passenger capacity. The aircraft must be affordable and marketable. The new HSCT must be able to sustain long-duration flights and to absorb the abuse of daily operation. The new aircraft must be safe and simple to fly and require a minimum amount of maintenance. This aircraft must meet FAA certification criteria of FAR Part 25 and environmental constraints. Several design configurations were examined and two designs were selected for further investigation. The first design employs the delta planform wings and conventional empennage layout. The other design uses a swing wing layout and conventional empennage. Other engineering challenges, including materials and propulsion are also discussed. At a cruise flight speed between Mach 2.2 and Mach 3.0, no current generation of materials can endure the thermal loading of supersonic flight and satisfy the stringent weight requirements. A new generation of lightweight composite materials must be developed for the HSCT. With the enforcement of stage 3 noise restrictions, these new engines must be able to propel the aircraft and satisfy the noise limit. The engine with the most promise is the variable cycle engine. At low subsonic speeds the engine operates like a turbofan engine, providing the most efficient performance. At higher speeds the variable cycle engine operates as a turbojet power plant. The two large

engine manufacturers, General Electric and Pratt & Whitney in the United States, are combining forces to make the variable cycle engine a reality.

PROJECT ARES 3 c05
Dan Raymer, Phyllis Russell, Tim Fox, Doug Meyers, Steven Lovric, Robert Grabow, Manfred Epp, Warren Wynn, Jr., Zoltan Mako, and Gunther Linzner et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 406-412 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

The mission of Project Ares is to design and fabricate an Earth prototype, autonomous flying rover capable of flying on the Martian surface. The project was awarded to California State University, Northridge (CSUN) in 1989 where an in-depth paper study was completed. The second year's group, Project Ares 2, designed and fabricated a full-scale flight demonstration aircraft. Project Ares 3, the third and final group, is responsible for propulsion system design and installation, controls and instrumentation, and high altitude testing. The propulsion system consists of a motor and its power supply, geartrain, and propeller. The motor is a four-brush DC motor powered by a 50-V NiCd battery supply. A pulley and belt arrangement is used for the geartrain and includes light weight, low temperature materials. The propeller is constructed from composite materials which ensures high strength and light weight, and is specifically developed to provide thrust at extremely high altitudes. The aircraft is controlled with a ground-based radio control system and an autopilot which will activate in the event that the control signal is lost. A transponder is used to maintain radar contact for ground tracking purposes. The aircraft possesses a small, onboard computer for collecting and storing flight data. To safeguard the possibility of computer failure, all flight data is transmitted to a ground station via a telemetry system. An initial, unpowered, low-level test flight was completed in August of 1991. Testing of systems integration in the second low-level test flight resulted in loss of elevator control which caused considerable damage on landing. Complete failure analysis and repairs are scheduled for September of 1992. Author

TESSERACT SUPERSONIC BUSINESS TRANSPORT c05
Eli Reshotko, Gary Garbinski, James Fellenstein, Mary Botting, Joan Hooper, Michael Ryan, Peter Struk, Ben Taggart, Maggie Taillon, and Gary Warzynski *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 413-424 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

This year, the senior level Aerospace Design class at Case Western Reserve University developed a conceptual design of a supersonic business transport. Due to the growing trade between Asia and the United States, a transpacific range was chosen for the aircraft. A Mach number of 2.2 was chosen, too, because it provides reasonable block times and allows the use of a large range of materials without a need for active cooling. A payload of 2,500 lbs. was assumed corresponding to a complement of nine passengers and crew, plus some light cargo. With these general requirements set, the class was broken down into three groups. The aerodynamics of the aircraft were the responsibility of the first group. The second developed the propulsion system. The efforts of both the aerodynamics and propulsion groups were monitored and reviewed for weight considerations and structural feasibility by the third group. Integration of the design required considerable interaction between the groups in the final stages. The fuselage length of the final conceptual design was 107.0 ft, while the diameter of the fuselage was 7.6 ft. The delta wing design consisted of an aspect ratio of 1.9 with a wing span of 47.75 ft and mid-chord length of 61.0 ft. A SNECMA MCV 99 variable-cycle engine design was chosen for this aircraft. A REVOLUTIONARY APPROACH TO COMPOSITE CONSTRUCTION AND FLIGHT MANAGEMENT SYSTEMS FOR SMALL, GENERAL AVIATION AIRPLANES c05
Jan Roskam and Ed Wenninger *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 425-436 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

The design studies for two composite general aviation airplanes are presented. The main consideration for both of the designs was to avoid the typical 'metal replacement' philosophy that has hindered the widespread use of composites in general aviation aircraft. The first design is for a low wing aircraft based on the Smith Aircraft Corporation GT-3 Global Trainer. The second aircraft is a composite version of the Cessna 152. The project was conducted as a graduate level design class under the auspices of the KU/NASA/USRA Advanced Design Program in aeronautics. The results obtained from the Fall semester of 1991 and the Spring semester of 1992 are presented. Author (revised)

DESIGN STUDY TO SIMULATE THE DEVELOPMENT OF A COMMERCIAL FREIGHT TRANSPORTATION SYSTEM c05
Stephen M. Batill, Kevin Costello, and Jim Pinkelman *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 437-452 (For primary document see N94-25665 07-80)
Avail: CASI HC A03/MF A04

The Notre Dame Aerospace Engineering senior class was divided into six design teams. A request for proposals (RFP) asking for the design of a remotely piloted vehicle (RPV) was given to the class, and each design team was responsible for designing, developing, producing, and presenting an RPV concept. The RFP called for the design of commercial freight transport RPV. The RFP provided a description of a fictitious world called 'Aeroworld'. Aeroworld's characteristics were scaled to provide the same types of challenges for RPV design that the real world market provides for the design of commercial aircraft. Fuel efficiency, range and payload capabilities, production and maintenance costs, and profitability are a few of the challenges that were addressed in this course. Each design team completed their project over the course of a semester by designing and flight testing a prototype, freight-carrying remotely piloted vehicle. Author

THE DESIGN OF FOUR HYPERSONIC RECONNAISSANCE AIRCRAFT c05
G. M. Gregorek and D. T. Detwiler *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 453-462 (For primary document see N94-25665 07-80)
Avail: CASI HC A02/MF A04

Four different hypersonic reconnaissance aircraft were designed by separate student teams. These aircraft were designed to provide the U.S. with a system to acquire aerial tactical reconnaissance when satellite reconnaissance proved unobtainable or ineffective. The design requirements given for this project stated that these aircraft must carry a 7500 lb, 250 cu ft payload of electronic and photographic intelligence gathering equipment over a target area at speeds between Mach 4-7 and at altitudes above 80,000 ft. Two of the aircraft were required to be manned by a crew of two and have a range of 12,000 nmi. One of these was to use airborne refueling to complete its mission while the other was not to use any refueling. The other two aircraft were required to be unmanned with a range of 6,000 nmi. One of these was to take off from another aircraft. The final details of all four aircraft designs along with an overview of the design process is provided. Author (revised)

DESIGN OF A REFUELING TANKER DELIVERING LIQUID HYDROGEN c05
Daniel Lourme, Caroline Barnier, Sabine Faure, Marie-Helene Pompei, and Karine Pruniaux *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 463-466 (For primary document see N94-25665 07-80)
Avail: CASI HC A01/MF A04

A refueling tanker that could deliver 155,000 lb of liquid hydrogen to a hypersonic tanker in 15 min was designed. A flying boom system was chosen to fit strict delivery criteria. Tank design and material specification were also addressed. To assure the flow required, it was important to cancel the pressure drop phenomenon. Geometry, aerodynamics, weight considerations, propulsion, stability, and performance for the tanker were also considered. Finally, the cost of developing three prototypes was estimated. Author

THE DESIGN OF A LONG-RANGE MEGATRANSPORT AIRCRAFT c05

Terrence A. Weisshaar and Carl L. Allen *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 467-476 (For primary document see N94-25665 07-80)

Avail: CASI HC A02/MF A04

Aircraft manufacturers are examining the market and feasibility of long-range passenger aircraft carrying more than 600 passengers. These aircraft would carry travelers at reduced cost and, at the same time, reduce congestion around major airports. The design of a large, long-range transport involves broad issues such as: the integration of airport terminal facilities; passenger loading and unloading; trade-offs between aircraft size and the cost to reconfigure these existing facilities; and, defeating the 'square-cube' law. Thirteen Purdue design teams generated RFP's that defined passenger capability and range, based upon team perception of market needs and infrastructure constraints. Turbofan engines were designed by each group to power these aircraft. The design problem and the variety of solutions developed are reviewed. Author (revised)

SOLAR POWERED MULTIPURPOSE REMOTELY POWERED AIRCRAFT c05

A. N. Alexandrou, W. W. Durgin, R. F. Cohn, D. J. Olinger, Charlotte K. Cody, Agnes Chan, Kwok-Hung Cheung, Kristin Conley, Paul M. Crivelli, and Christian T. Javorski et al *In* USRA, Proceedings of the 8th Annual Summer Conference: NASA/USRA Advanced Design Program 1992 p 477-489 (For primary document see N94-25665 07-80)

Avail: CASI HC A03/MF A04

Increase in energy demands coupled with rapid depletion of natural energy resources have deemed solar energy as an attractive alternative source of power. The focus was to design and construct a solar powered, remotely piloted vehicle to demonstrate the feasibility of solar energy as an effective, alternate source of power. The final design included minimizing the power requirements and maximizing the strength-to-weight and lift-to-drag ratios. Given the design constraints, Surya (the code-name given to the aircraft), is a lightweight aircraft primarily built using composite materials and capable of achieving level flight powered entirely by solar energy. THE 1993 NASA-ODU AMERICAN SOCIETY FOR ENGINEERING EDUCATION (ASEE) SUMMER FACULTY FELLOWSHIP PROGRAM

Final Report, 7 Jun. - 13 Aug. 1993

Surendra N. Tiwari, comp. and Deborah B. Young, comp Dec. 1993 238 p Fellowship program held in Norfolk, VA, 1993 Sponsored in part by NASA. Langley Research Center

(Grant NGT-47-003-029)

(NASA-CR-191544; NAS 1.26:191544) Avail: CASI HC A11/MF A03

Since 1964, the National Aeronautics and Space Administration has supported a program of summer faculty fellowships for engineering and science educators. In a series of collaborations between NASA research and development centers and nearby universities, engineering faculty members spend 10 weeks working with professional peers on research. The Summer Faculty Program Committee of the American Society for Engineering Education supervises the programs. Objectives are: to further the professional knowledge of qualified engineering and science faculty members; to stimulate and exchange ideas between participants and NASA; to enrich and refresh the research and teaching activities of participants' institutions; and to contribute to the research objectives of the NASA center. For individual titles, see N94-27894 through N94-27930.

HYBRID TECHNIQUES FOR COMPLEX AEROSPACE ELECTROMAGNETICS PROBLEMS c32

Jim Aberle *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 65-67 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

Important aerospace electromagnetics problems include the evaluation of antenna performance on aircraft and the prediction and control of the aircraft's electromagnetic signature. Due to the ever increasing complexity and expense of aircraft design, aerospace engineers have become increasingly dependent on computer solutions. Traditionally, computational electromagnetics (CEM) has relied primarily on four disparate techniques: the method of moments (MoM), the finite-difference time-domain (FDTD) technique, the finite element method (FEM), and high frequency asymptotic techniques (HFAT) such as ray tracing. Each of these techniques has distinct advantages and disadvantages, and no single technique is capable of accurately solving all problems of interest on computers that are available now or will be available in the foreseeable future. As a result, new approaches that overcome the deficiencies of traditional techniques are beginning to attract a great deal of interest in the CEM community. Among these new approaches are hybrid methods which combine two or more of these techniques into a coherent model. During the ASEE Summer Faculty Fellowship Program a hybrid FEM/MoM computer code was developed and applied to a geometry containing features found on many modern aircraft. Author (revised)

RIAD VISUAL IMAGING BRANCH ASSESSMENT c35

Sherilee F. Beam *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 68-70 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

Every year the demand to visualize research efforts increases. The visualization provides the means to effectively analyze data and present the results. The technology support for visualization is constantly changing, improving, and being made available to users everywhere. As such, many researchers are entering into the practice of doing their own visualization in house - sometimes successfully, sometimes not. In an effort to keep pace with the visualization needs of researchers, the Visual Imaging Branch of the Research, Information, and Applications Division at NASA Langley Research Center has conducted an investigation into the current status of imaging technology and imaging production throughout the various research branches at the center. This investigation will allow the branch to evaluate its current resources and personnel in an effort to identify future directions for meeting the needs of the researchers at the center. The investigation team, which consisted of the ASEE fellow, the head of the video section, and the head of the photo section, developed an interview format that could be accomplished during a short interview period with researchers, and yet still provide adequate statistics about items such as in-house equipment and usage. ON IDENTIFIED PREDICTIVE CONTROL c63

Jan T. Bialasiewicz *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 71-73 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

Self-tuning control algorithms are potential successors to manually tuned PID controllers traditionally used in process control applications. A very attractive design method for self-tuning controllers, which has been developed over recent years, is the long-range predictive control (LRPC). The success of LRPC is due to its effectiveness with plants of unknown order and dead-time which may be simultaneously nonminimum phase and unstable or have multiple lightly damped poles (as in the case of flexible structures or flexible robot arms). LRPC is a receding horizon strategy and can be, in general terms, summarized as follows. Using assumed long-range (or multi-step) cost function the optimal control law is found in terms of unknown parameters of the predictor model of the process, current input-output sequence, and future reference signal sequence. The common approach is to assume that the input-output process model is known or separately identified and then to find the parameters of the predictor model. Once these are known, the optimal control law determines control signal at the current time t which is applied at the process input and the whole procedure is repeated at the next time instant. Most of the recent research in this field is apparently centered around the LRPC formulation developed by Clarke et al., known as generalized predictive control (GPC). GPC uses ARIMAX/CARIMA model of the process in its input-output formulation. In this paper, the GPC formulation is used but the process predictor model is derived from the state space formulation of the ARIMAX model and is directly identified over the receding horizon, i.e., using current input-output sequence. The underlying technique in the design of identified predictive control (IPC) algorithm is the identification algorithm of observer/Kalman filter Markov parameters developed by Juang et al. at NASA Langley Research Center and successfully applied to identification of flexible structures. EFFECTS OF PHYSICAL AGING ON LONG-TERM BEHAVIOR OF COMPOSITES **c24**

L. Catherine Brinson *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 74-77 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

The HSCT plane, envisioned to have a lifetime of over 60,000 flight hours and to travel at speeds in excess of Mach 2, is the source of intensive study at NASA. In particular, polymer matrix composites are being strongly considered for use in primary and secondary structures due to their high strength to weight ratio and the options of property tailoring. However, an added difficulty in the use of polymer based materials is that their properties change significantly over time, especially at the elevated temperatures that will be experienced during flight, and prediction of properties based on irregular thermal and mechanical loading is extremely difficult. This study focused on one aspect of long-term polymer composite behavior: physical aging. When a polymer is cooled to below its glass transition temperature, the material is not in thermodynamic equilibrium and the free volume and enthalpy evolve over time to approach their equilibrium values. During this time, the mechanical properties change significantly and this change is termed physical aging. This work begins with a review of the concepts of physical aging on a pure polymer system. The effective time theory, which can be used to predict long term behavior based on short term data, is mathematically formalized. The effects of aging to equilibrium are proven and discussed. The theory developed for polymers is then applied first to a unidirectional composite, then to a general laminate. Comparison to experimental data is excellent. It is shown that the effects of aging on the long-term properties of composites can be counter-intuitive, stressing the importance of the development and use of a predictive theory to analyze structures. Author (revised)

PROTON IRRADIATION ON MATERIALS **c72**

C. Ken Chang *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 78-79 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

A computer code is developed by utilizing a radiation transport code developed at NASA Langley Research Center to study the proton radiation effects on materials which have potential application in NASA's future space missions. The code covers the proton energy from 0.01 Mev to 100 Gev and is sufficient for energetic protons encountered in both low earth and geosynchronous orbits. With some modification, the code can be extended for particles heavier than proton as the radiation source. The code is capable of calculating the range, stopping power, exit energy, energy deposition coefficients, dose, and cumulative dose along the path of the proton in a target material. The target material can be any combination of the elements with atomic number ranging from 1 to 92, or any compound with known chemical composition. The generated cross section for a material is stored and is reused in future to save computer time. This information can be utilized to calculate the proton dose a material would receive in an orbit when the radiation environment is known. It can also be used to determine, in the laboratory, the parameters such as beam current of proton and irradiation time to attain the desired dosage for accelerated ground testing of any material. It is hoped that the present work be extended to include polymeric and composite materials which are prime candidates for use as coating, electronic components, and structure building. It is also desirable to determine, for ground testing these materials, the laboratory parameters in order to simulate the dose they would receive in space environments. A sample print-out for water subject to 1.5 Mev proton is included as a reference. Author (revised)

A COMPREHENSIVE COMPARISON OF TURBULENCE MODELS IN THE FAR WAKE **c34**

John M. Cimbala *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 80-82 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

In the present study, the far wake was examined numerically using an implicit, upwind, finite-volume, compressible Navier-Stokes code. The numerical grid started at 500 equivalent circular cylinder diameters in the wave, and extended to 4000 equivalent diameters. By concentrating only on the far wake, the numerical difficulties and fine mesh requirements near the wake-generating body were eliminated. At the time of this writing, results for the K-epsilon and K-omega turbulence models at low Mach number have been completed and show excellent agreement with previous incompressible results and far-wake similarity solutions. The code is presently being used to compare the performance of various other turbulence models, including Reynolds stress models and the new anisotropic two-equation turbulence models being developed at NASA Langley. By increasing our physical understanding of the deficiencies and limits of these models, it is hoped that improvements to the universality of the models can be made. Future plans include examination of two-dimensional momentumless wakes as well. Author (revised)

AN EXPERIMENTAL INVESTIGATION OF FATIGUE DAMAGE IN ALUMINUM 2024-T3 ALLOYS **c26**

Milton W. Ferguson *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 83-84 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

Aluminum alloys are finding increasing use in the aerospace and automobile industries due to their attractive low density-high modulus and low density-high strength characteristics. Unfortunately, cyclic stress-strain deformation alters the microstructure of the material. These structural changes can lead to fatigue damage and ultimately service failure. Therefore, in order to assess the integrity of the alloy, a correlation between fatigue damage and a measurable microstructural property is needed. Aluminum 2024-T3, a commonly used commercial alloy, contains many grains (individual crystals) of various orientations. The sizes and orientations of these grains are known to affect the strength, hardness, and magnetic permeability of polycrystalline alloys and metals; therefore, perhaps a relationship between a grain property and the fatigue state can be established. Tension-compression cycling in aluminum alloys can also induce changes in their dislocation densities. These changes can be studied from measurements of the electrical resistivities of the materials. Consequently, the goals of this investigation were: to study the grain orientation of aluminum 2024-T3 and to seek a correlation between the grain orientation and the fatigue state of the material; and to measure the electrical resistivities of fatigued samples of aluminum 2024-T3 and to interpret the findings. BRAIN WAVE CORRELATES OF ATTENTIONAL STATES: EVENT RELATED POTENTIALS AND QUANTITATIVE EEG ANALYSIS DURING PERFORMANCE OF COGNITIVE AND PERCEPTUAL TASKS c53

Frederick G. Freeman *In its* The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 85-88 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

The increased use of automation in the cockpits of commercial planes has dramatically decreased the workload requirements of pilots, enabling them to function more efficiently and with a higher degree of safety. Unfortunately, advances in technology have led to an unexpected problem: the decreased demands on pilots have increased the probability of inducing 'hazardous states of awareness.' A hazardous state of awareness is defined as a decreased level of alertness or arousal which makes an individual less capable of reacting to unique or emergency types of situations. These states tend to be induced when an individual is not actively processing information. Under such conditions a person is likely to let his/her mind wander, either to internal states or to irrelevant external conditions. As a result, they are less capable of reacting quickly to emergency situations. Since emergencies are relatively rare, and since the high automated cockpit requires progressively decreasing levels of engagement, the probability of being seduced into a lowered state of awareness is increasing. This further decreases the readiness of the pilot to react to unique circumstances such as system failures. The HEM Lab at NASA-Langley Research Center has been studying how these states of awareness are induced and what the physiological correlates of these different states are. Specifically, they have been interested in studying electroencephalographic (EEG) measures of different states of alertness to determine if such states can be identified and, hopefully, avoided. The project worked on this summer involved analyzing the EEG and the event related potentials (ERP) data collected while subjects performed under two conditions. Each condition required subjects to perform a relatively boring vigilance task. The purpose of using these tasks was to induce a decreased state of awareness while still requiring the subject to process information. Each task involved identifying an infrequently presented target stimulus. In addition to the task requirements, irrelevant tones were presented in the background. Research has shown that even though these stimuli are not attended, ERP's to them can still be elicited. The amplitude of the ERP waves has been shown to change as a function of a person's level of alertness. ERP's were also collected and analyzed for the target stimuli for each task. Brain maps were produced based on the ERP voltages for the different stimuli. In addition to the ERP's, a quantitative EEG (QEEG) was performed on the data using a fast Fourier technique to produce a power spectral analysis of the EEG. This analysis was conducted on the continuous EEG while the subjects were performing the tasks. Finally, a QEEG was performed on periods during the task when subjects indicated that they were in an altered state of awareness. During the tasks, subjects were asked to indicate by pressing a button when they realized their level of task awareness had changed. EEG epochs were collected for times just before and just after subjects made this reponse. The purpose of this final analysis was to determine whether or not subjective indices of level of awareness could be correlated with different patterns of EEG. Derived from text

INVESTIGATION OF AERODYNAMIC DESIGN ISSUES WITH REGIONS OF SEPARATED FLOW c02

Tom Gally *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 89-90 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

Existing aerodynamic design methods have generally concentrated on the optimization of airfoil or wing shapes to produce a minimum drag while satisfying some basic constraints such as lift, pitching moment, or thickness. Since the minimization of drag almost always precludes the existence of separated flow, the evaluation and validation of these design methods for their robustness and accuracy when separated flow is present has not been aggressively pursued. However, two new applications for these design tools may be expected to include separated flow and the issues of aerodynamic design with this feature must be addressed. The first application of the aerodynamic design tools is the design of airfoils or wings to provide an optimal performance over a wide range of flight conditions (multipoint design). While the definition of 'optimal performance' in the multipoint setting is currently being hashed out, it is recognized that given a wide range of flight conditions, it will not be possible to ensure a minimum drag constraint at all conditions, and in fact some amount of separated flow (presumably small) may have to be allowed at the more demanding flight conditions. Thus a multipoint design method must be tolerant of the existence of separated flow and may include some controls upon its extent. The second application is in the design of wings with extended high speed buffet boundaries of their flight envelopes. Buffet occurs on a wing when regions of flow separation have grown to the extent that their time varying pressures induce possible destructive effects upon the wing structure or adversely effect either the aircraft controllability or passenger comfort. A conservative approach to the expansion of the buffet flight boundary is to simply expand the flight envelope of nonseparated flow under the assumption that buffet will also thus be alleviated. However, having the ability to design a wing with separated flow and thus to control the location, extent and severity of the separated flow regions may allow aircraft manufacturers to gain an advantage in the early design stages of an aircraft, when configuration changes are relatively inexpensive to make. The goal of the summer research at NASA Langley Research Center (LaRC) was twofold: first, to investigate a particular airfoil design problem observed under conditions of strong shock induced flow separation on the upper surface of an airfoil at transonic conditions; and second, to suggest and investigate design methodologies for the prediction (or detection) and control of flow separation. The context of both investigations was to use an existing two dimensional Navier-Stokes flow solver and the constrained direct/iterative surface curvature (CDISC) design algorithm developed at LaRC. As a lead in to the primary task, it was necessary to gain a familiarity with both the design method and the computational analysis and to perform the FORTRAN coding needed to couple them together. MICROSPHERES FOR LASER VELOCIMETRY IN HIGH TEMPERATURE WIND TUNNEL c09

Anthony Ghorieshi *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 91-99 (For primary document see N94-27893 07-80)

Avail: CASI HC A02/MF A03

The introduction of non-intrusive measurement techniques in wind tunnel experimentation has been a turning point in error free data acquisition. Laser velocimetry has been progressively implemented and utilized in various wind tunnels; e.g. subsonic, transonic, and supersonic. The success of the laser velocimeter technique is based on an accurate measurement of scattered light by seeding particles introduced into the flow stream in the wind tunnel. Therefore, application of appropriate seeding particles will affect, to a large extent the acquired data. The seeding material used depends on the type of experiment being run. Among the seeding material for subsonic tunnel are kerosene, Kaolin, and polystyrene. Polystyrene is known to be the best because of being solid particles, having high index of refraction, capable of being made both spherical and monodisperse. However for high temperature wind tunnel testing seeding material must have an additional characteristic that is high melting point. Typically metal oxide powders such as Al2O3 with melting point 3660 F are used. The metal oxides are, however polydispersed, have a high density, and a tendency to form large agglomerate that does not closely follow the flow velocity. The addition of flame phase silica to metal oxide helps to break up the agglomerates, yet still results in a narrow band of polydispersed seeding. The less desirable utility of metal oxide in high temperature wind tunnels necessitates the search for a better alternative particle seeding which this paper addresses. The Laser Velocimetry (LV) characteristic of polystyrene makes it a prime candidate as a base material in achieving the high temperature particle seeding inexpensively. While polystyrene monodisperse seeding particle reported has been successful in a subsonic wind tunnel, it lacks the high melting point and thus is not practically usable in a high temperature wind tunnel. It is well known that rise in melting point of polystyrene can be achieved by a cross-linking technique. Since polystyrene already possesses all the desired characteristics for LV, to circumvent the low melting point, a cross-linking technique was investigated. Author

NEW MONOMERS FOR HIGH PERFORMANCE POLYMERS **c27**

Roy F. Gratz *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 100-101 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

This laboratory has been concerned with the development of new polymeric materials with high thermo-oxidative stability for use in the aerospace and electronics industries. Currently, there is special emphasis on developing matrix resins and composites for the high speed civil transport (HSCT) program. This application requires polymers that have service lifetimes of 60,000 hr at 350 F (177 C) and that are readily processible into void-free composites, preferably by melt-flow or powder techniques that avoid the use of high boiling solvents. Recent work has focused on copolymers which have thermally stable imide groups separated by flexible arylene ether linkages, some with trifluoromethyl groups attached to the aromatic rings. The presence of trifluoromethyl groups in monomers and polymers often improves their solubility and processibility. The goal of this research was to synthesize several new monomers containing pendant trifluoromethyl groups and to incorporate these monomers into new imide/arylene ether copolymers. Initially, work was begun on the synthesis of three target compounds. The first two, 3,5-dihydroxybenzo trifluoride and 3-amino 5-hydroxybenzo trifluoride, are intermediates in the synthesis of more complex monomers. The third, 3,5-bis (3-amino-phenoxy) benzotrifluoride, is an interesting diamine that could be incorporated into a polyimide directly. Author

NEURAL CONTROL OF MAGNETIC SUSPENSION SYSTEMS **c09**

W. Steven Gray *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 102-103 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

The purpose of this research program is to design, build and test (in cooperation with NASA personnel from the NASA Langley Research Center) neural controllers for two different small air-gap magnetic suspension systems. The general objective of the program is to study neural network architectures for the purpose of control in an experimental setting and to demonstrate the feasibility of the concept. The specific objectives of the research program are: (1) to demonstrate through simulation and experimentation the feasibility of using neural controllers to stabilize a nonlinear magnetic suspension system; (2) to investigate through simulation and experimentation the performance of neural controllers designs under various types of parametric and nonparametric uncertainty; (3) to investigate through simulation and experimentation various types of neural architectures for real-time control with respect to performance and complexity; and (4) to benchmark in an experimental setting the performance of neural controllers against other types of existing linear and nonlinear compensator designs. To date, the first one-dimensional, small air-gap magnetic suspension system has been built, tested and delivered to the NASA Langley Research Center. The device is currently being stabilized with a digital linear phase-lead controller. The neural controller hardware is under construction. Two different neural network paradigms are under consideration, one based on hidden layer feedforward networks trained via back propagation and one based on using Gaussian radial basis functions trained by analytical methods related to stability conditions. Some advanced nonlinear control algorithms using feedback linearization and sliding mode control are in simulation studies. Author (revised)

SPACECRAFT OPTICAL DISK RECORDER MEMORY BUFFER CONTROL **c35**

Robert F. Hodson *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 109-113 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

This paper discusses the research completed under the NASA-ASEE summer faculty fellowship program. The project involves development of an Application Specific Integrated Circuit (ASIC) to be used as a Memory Buffer Controller (MBC) in the Spacecraft Optical Disk System (SODR). The SODR system has demanding capacity and data rate specifications requiring specialized electronics to meet processing demands. The system is being designed to support Gigabit transfer rates with Terabit storage capability. The complete SODR system is designed to exceed the capability of all existing mass storage systems today. The ASIC development for SODR consist of developing a 144 pin CMOS device to perform format conversion and data buffering. The final simulations of the MBC were completed during this summer's NASA-ASEE fellowship along with design preparations for fabrication to be performed by an ASIC manufacturer. Author

SYSTEM IDENTIFICATION OF THE LARGE-ANGLE MAGNETIC SUSPENSION TEST FACILITY (LAMSTF) **c09**

Jen-Kuang Huang *In its* The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 114-115 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

The Large-Angle Magnetic Suspension Test Facility (LAMSTF), a laboratory-scale research project to demonstrate the magnetic suspension of objects over wide ranges of attitudes, has been developed. This system represents a scaled model of a planned Large-Gap Magnetic Suspension System (LGMSS). The LAMSTF system consists of a planar array of five copper electromagnets which actively suspend a small cylindrical permanent magnet. The cylinder is a rigid body and can be controlled to move in five independent degrees of freedom. Five position variables are sensed indirectly by using infra-red light-emitting diodes and light-receiving phototransistors. The motion of the suspended cylinder is in general nonlinear and hence only the linear, time-invariant perturbed motion about an equilibrium state is considered. One of the main challenges in this project is the control of the suspended element over a wide range of orientations. An accurate dynamic model plans an essential role in controller design. The analytical model of the LAMSTF system includes highly unstable real poles (about 10 Hz) and low-frequency flexible modes (about 0.16 Hz). Projection filters are proposed to identify the state space model from closed-loop test data in time domain. A canonical transformation matrix is also derived to transform the identified state space model into the physical coordinate. The LAMSTF system is stabilized by using a linear quadratic regulator (LQR) feedback controller. The rate information is obtained by calculating the back difference of the sensed position signals. The reference inputs contain five uncorrelated random signals. This control input and the system reponse are recorded as input/output data to identify the system directly from the projection filters. The sampling time is 4 ms and the model is fairly accurate in predicting the step responses for different controllers while the analytical model has a deficiency in the pitch axis. Author

KINETIC PARAMETERS FROM THERMOGRAVIMETRIC ANALYSIS **c25**

Richard L. Kiefer *In* Old Dominion Univ., The 1993 NASA-ODU American

Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 116-119 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

High performance polymeric materials are finding increased use in aerospace applications. Proposed high speed aircraft will require materials to withstand high temperatures in an oxidative atmosphere for long periods of time. It is essential that accurate estimates be made of the performance of these materials at the given conditions of temperature and time. Temperatures of 350 F (177 C) and times of 60,000 to 100,000 hours are anticipated. In order to survey a large number of high performance polymeric materials on a reasonable time scale, some form of accelerated testing must be performed. A knowledge of the rate of a process can be used to predict the lifetime of that process. Thermogravimetric analysis (TGA) has frequently been used to determine kinetic information for degradation reactions in polymeric materials. Flynn and Wall studied a number of methods for using TGA experiments to determine kinetic information in polymer reactions. Kinetic parameters, such as the apparent activation energy and the frequency factor, can be determined in such experiments. Recently, researchers at the McDonnell Douglas Research Laboratory suggested that a graph of the logarithm of the frequency factor against the apparent activation energy can be used to predict long-term thermo-oxidative stability for polymeric materials. Such a graph has been called a kinetic map. In this study, thermogravimetric analyses were performed in air to study the thermo-oxidative degradation of several high performance polymers and to plot their kinetic parameters on a kinetic map. THE MOLECULAR MATCHING PROBLEM **c72**
Rex K. Kincaid *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 120-122 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

Molecular chemistry contains many difficult optimization problems that have begun to attract the attention of optimizers in the Operations Research community. Problems including protein folding, molecular conformation, molecular similarity, and molecular matching have been addressed. Minimum energy conformations for simple molecular structures such as water clusters, Lennard-Jones microclusters, and short polypeptides have dominated the literature to date. However, a variety of interesting problems exist and we focus here on a molecular structure matching (MSM) problem. Author

A NUMERICAL STUDY OF MIXING AND COMBUSTION IN HYPERVELOCITY FLOWS THROUGH A SCRAMJET COMBUSTOR MODEL **c34**
Ramesh Krishamurthy *In its* The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 123-125 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

Interest in high speed, air-breathing propulsion systems such as scramjets has revived in recent years fueled to a large extent by the National Aerospace Plane (NASP) program. These vehicles are expected to fly trans-atmospheric and as a consequence, the Mach number level within the engine/combustor would be rather high (M greater than 5). Ground based testing of such scramjet engines requires a facility that can not only achieve the right Mach number, but also have the proper pressures and temperatures to simulate the combustion processes. At present, only pulse type facilities can provide such high enthalpy flows. The newest of these is the free-piston shock tunnel, T5 located at GALCIT. Recently, a generic combustor model was tested in T5, and the experimental data from that study is analyzed in the present report. The available experimental data from T5 are essentially the static pressures on the injection wall and the one opposite to it. Thus, a principal aim of the present study was to validate the available experimental data by using a proven CFD tool and then investigate the performance characteristics of the combustor model, such as, the mixing efficiency and combustion efficiency. For this purpose, in this study, the code GASP has been used. Author

EXPERIMENTAL APPARATUS FOR OPTIMIZATION OF FLAP POSITION FOR A THREE-ELEMENT AIRFOIL MODEL **c09**
Drew Landman *In its* The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 126-128 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

It is proposed to design and build a wind tunnel model comprising a Douglas Aircraft Company three-element high-lift airfoil with internal actuators to move the flap vertically and horizontally under computer control. The model will be used to find the optimum flap location for a fixed angle of attack, slat position and flap deflection angle. The model will span the full tunnel width and lift will be measured by integration of pressure readings taken from midspan taps. It is proposed to conduct experiments in the NASA Langley EFPB 2' x 3' low speed wind tunnel. This report serves as a project overview and a review of work completed to date through funding by the 1993 NASA/ASEE Summer Faculty Fellowship Program. Author

AN OVERVIEW ON DEVELOPMENT OF NEURAL NETWORK TECHNOLOGY Abstract Only **c63**
Chun-Shin Lin *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 129 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

The study has been to obtain a bird's-eye view of the current neural network technology and the neural network research activities in NASA. The purpose was two fold. One was to provide a reference document for NASA researchers who want to apply neural network techniques to solve their problems. Another one was to report out survey results regarding NASA research activities and provide a view on what NASA is doing, what potential difficulty exists and what NASA can/should do. In a ten week study period, we interviewed ten neural network researchers in the Langley Research Center and sent out 36 survey forms to researchers at the Johnson Space Center, Lewis Research Center, Ames Research Center and Jet Propulsion Laboratory. We also sent out 60 similar forms to educators and corporation researchers to collect general opinions regarding this field. Twenty-eight survey forms, 11 from NASA researchers and 17 from outside, were returned. Survey results were reported in our final report. In the final report, we first provided an overview on the neural network technology. We reviewed ten neural network structures, discussed the applications in five major areas, and compared the analog, digital and hybrid electronic implementation of neural networks. In the second part, we summarized known NASA neural network research studies and reported the results of the questionnaire survey. Survey results show that most studies are still in the development and feasibility study stage. We compared the techniques, application areas, researchers' opinions on this technology, and many aspects between NASA and non-NASA groups. We also summarized their opinions on difficulties encountered. Applications are considered the top research priority by most researchers. Hardware development and learning algorithm improvement are the next. The lack of financial and management support is among the difficulties in research study. All researchers agree that the use of neural networks could result in cost saving. Fault tolerance has been claimed as one important feature of neural computing. However, the survey indicates that very few studies address this issue. Fault tolerance is important in space mission and aircraft control. We believe that it is worthy for NASA to devote more efforts into the utilization of this feature. Author

MECHANICALLY FASTENED COMPOSITE LAMINATES SUBJECTED TO COMBINED BEARING-BYPASS AND SHEAR LOADING **c24**
Erdogan Madenci *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 130-136 (For primary document see N94-27893 07-80)
Avail: CASI HC A02/MF A03

Bolts and rivets provide a means of load transfer in the construction of aircraft. However, they give rise to stress concentrations and are often the source and location of static and fatigue failures. Furthermore, fastener holes are prone to cracks during take-off and landing. These cracks present the most common origin of structural failures in aircraft. Therefore, accurate determination of the contact stresses associated with such loaded holes in mechanically fastened joints is essential to reliable strength evaluation and failure prediction. As the laminate is subjected to loading, the contact region, whose extent is not known, develops between the fastener and the hole boundary through this contact region, which consists of slip and no-slip zones due to friction. The presence of the unknown contact stress distribution over the contact region between the pin and the composite laminate, material anisotropy, friction between the pin and the laminate, pin-hole clearance, combined bearing-bypass and shear loading, and finite geometry of the laminate result in a complex non-linear problem. In the case of bearing-bypass loading in compression, this non-linear problem is further complicated by the presence of dual contact regions. Previous research concerning the analysis of mechanical joints subjected to combined bearing-bypass and shear loading is non-existent. In the case of bearing-bypass loading only, except for the study conducted by Naik and Crews (1991), others employed the concept of superposition which is not valid for this non-linear problem. Naik and Crews applied a linear finite element analysis with conditions along the pin-hole contact region specified as displacement constraint equations. The major shortcoming of this method is that the variation of the contract region as a function of the applied load should be known a priori. Also, their analysis is limited to symmetric geometry and material systems, and frictionless boundary conditions. Since the contact stress distribution and the contact region are not known a priori, they did not directly impose the boundary conditions appropriate for modelling the contact and on-contact regions between the fastener and the hole. Furthermore, finite element analysis is not suitable for iterative design calculations for optimizing laminate construction in the presence of fasteners under complex loading conditions. In this study, the solution method developed by Madenci and Ileri (1992a,b) has been extended to determine the contact stresses in mechanical joints under combined bearing-bypass and shear loading, and bearing-bypass loading in compression resulting in dual contact regions. RADIATIONS FROM HOT NUCLEI **c72**

F. Bary Malik *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 137-139 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

The investigation indicates that nuclei with excitation energy of a few hundred MeV to BeV are more likely to radiate hot nuclear clusters than neutrons. These daughter clusters could, furthermore, de-excite emitting other hot nuclei, and the chain continues until these nuclei cool off sufficiently to evaporate primarily neutrons. A few GeV excited nuclei could radiate elementary particles preferentially over neutrons. Impact of space radiation with materials (for example, spacecraft) produces highly excited nuclei which cool down emitting electromagnetic and particle radiations. At a few MeV excitation energy, neutron emission becomes more dominant than gamma-ray emission and one often attributes the cooling to take place by successive neutron decay. However, a recent experiment studying the cooling process of 396 MeV excited Hg-190 casts some doubt on this thinking, and the purpose of this investigation is to explore the possibility of other types of nuclear emission which might out-compete with neutron evaporation. REVIEW AND ANALYSIS OF DENSE LINEAR SYSTEM SOLVER PACKAGE FOR DISTRIBUTED MEMORY MACHINES **c61**

H. N. Narang *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 140-145 (For primary document see N94-27893 07-80)

Avail: CASI HC A02/MF A03

A dense linear system solver package recently developed at the University of Texas at Austin for distributed memory machine (e.g. Intel Paragon) has been reviewed and analyzed. The package contains about 45 software routines, some written in FORTRAN, and some in C-language, and forms the basis for parallel/distributed solutions of systems of linear equations encountered in many problems of scientific and engineering nature. The package, being studied by the Computer Applications Branch of the Analysis and Computation Division, may provide a significant computational resource for NASA scientists and engineers in parallel/distributed computing. Since the package is new and not well tested or documented, many of its underlying concepts and implementations were unclear; our task was to review, analyze, and critique the package as a step in the process that will enable scientists and engineers to apply it to the solution of their problems. All routines in the package were reviewed and analyzed. Underlying theory or concepts which exist in the form of published papers or technical reports, or memos, were either obtained from the author, or from the scientific literature; and general algorithms, explanations, examples, and critiques have been provided to explain the workings of these programs. Wherever the things were still unclear, communications were made with the developer (author), either by telephone or by electronic mail, to understand the workings of the routines. Whenever possible, tests were made to verify the concepts and logic employed in their implementations. A detailed report is being separately documented to explain the workings of these routines. WING DESIGN FOR A CIVIL TILTROTOR TRANSPORT AIRCRAFT: A PRELIMINARY STUDY **c05**

Masoud Rais-Rohani *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 147-148 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

A preliminary study was conducted on the design of the wing-box structure for a civil tiltrotor transport aircraft. The wing structural weight is to be minimized subject to structural and aeroelastic constraints. The composite wing-box structure is composed of skin, stringers, ribs, and spars. The design variables include skin ply thicknesses and orientations and spar cap and stringer cross-sectional areas. With the total task defined, an initial study was conducted to learn more about the intricate dynamic and aeroelastic characteristics of the tiltrotor aircraft and their roles in the wing design. Also, some work was done on the wing finite-element modeling (via PATRAN) which would be used in structural analysis and optimization. Initial studies indicate that in order to limit the wing/rotor aeroelastic and dynamic interactions in the preliminary design, the cruise speed, rotor system, and wing geometric attributes must all be held fixed. A SIMULATION OF GPS AND DIFFERENTIAL GPS SENSORS **c04**

James M. Rankin *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 149-153 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

The Global Positioning System (GPS) is a revolutionary advance in navigation. Users can determine latitude, longitude, and altitude by receiving range information from at least four satellites. The statistical accuracy of the user's position is directly proportional to the statistical accuracy of the range measurement. Range errors are caused by clock errors, ephemeris errors, atmospheric delays, multipath errors, and receiver noise. Selective Availability, which the military uses to intentionally degrade accuracy for non-authorized users, is a major error source. The proportionality constant relating position errors to range errors is the Dilution of Precision (DOP) which is a function of the satellite geometry. Receivers separated by relatively short distances have the same satellite and atmospheric errors. Differential GPS (DGPS) removes these errors by transmitting pseudorange corrections from a fixed receiver to a mobile receiver. The corrected pseudorange at the moving receiver is now corrupted only by errors from the receiver clock, multipath, and measurement noise. This paper describes a software package that models position errors for various GPS and DGPS systems. The error model is used in the Real-Time Simulator and Cockpit Technology workstation simulations at NASA-LaRC. The GPS/DGPS sensor can simulate enroute navigation, instrument approaches, or on-airport navigation. Author (revised)

AERODYNAMIC HEATING IN HYPERSONIC FLOWS c02
C. Subba Reddy *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 154-155 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

Aerodynamic heating in hypersonic space vehicles is an important factor to be considered in their design. Therefore the designers of such vehicles need reliable heat transfer data in this respect for a successful design. Such data is usually produced by testing the models of hypersonic surfaces in wind tunnels. Most of the hypersonic test facilities at present are conventional blow-down tunnels whose run times are of the order of several seconds. The surface temperatures on such models are obtained using standard techniques such as thin-film resistance gages, thin-skin transient calorimeter gages and coaxial thermocouple or video acquisition systems such as phosphor thermography and infrared thermography. The data are usually reduced assuming that the model behaves like a semi-infinite solid (SIS) with constant properties and that heat transfer is by one-dimensional conduction only. This simplifying assumption may be valid in cases where models are thick, run-times short, and thermal diffusivities small. In many instances, however, when these conditions are not met, the assumption may lead to significant errors in the heat transfer results. The purpose of the present paper is to investigate this aspect. Specifically, the objectives are as follows: (1) to determine the limiting conditions under which a model can be considered a semi-infinite body; (2) to estimate the extent of errors involved in the reduction of the data if the models violate the assumption; and (3) to come up with correlation factors which when multiplied by the results obtained under the SIS assumption will provide the results under the actual conditions. Author (revised)

DEVELOPMENT OF METHODOLOGIES FOR THE ESTIMATION OF THERMAL PROPERTIES ASSOCIATED WITH AEROSPACE VEHICLES c39
Elaine P. Scott *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 158-161 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

Thermal stress analyses are an important aspect in the development of aerospace vehicles such as the National Aero-Space Plane (NASP) and the High-Speed Civil Transport (HSCT) at NASA-LaRC. These analyses require knowledge of the temperature within the structures which consequently necessitates the need for thermal property data. The initial goal of this research effort was to develop a methodology for the estimation of thermal properties of aerospace structural materials at room temperature and to develop a procedure to optimize the estimation process. The estimation procedure was implemented utilizing a general purpose finite element code. In addition, an optimization procedure was developed and implemented to determine critical experimental parameters to optimize the estimation procedure. Finally, preliminary experiments were conducted at the Aircraft Structures Branch (ASB) laboratory. Author (revised)

EVALUATION OF HIGH TEMPERATURE SUPERCONDUCTIVE THERMAL BRIDGES FOR SPACE-BORNE CRYOGENIC INFRARED DETECTORS c35
Elaine P. Scott *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 162-165 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

The focus of this research is on the reduction of the refrigeration requirements for infrared sensors operating in space through the use of high temperature superconductive (HTS) materials as electronic leads between the cooled sensors and the relatively warmer data acquisition components. Specifically, this initial study was directed towards the design of an experiment to quantify the thermal performance of these materials in the space environment. First, an intensive review of relevant literature was undertaken, and then, design requirements were formulated. From this background information, a preliminary experimental design was developed. Additional studies will involve a thermal analysis of the experiment and further modifications of the experimental design. Author (revised)

A TRI-STATE OPTICAL SWITCH FOR LOCAL AREA NETWORK COMMUNICATIONS c33
Garfield Simms *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 170-176 (For primary document see N94-27893 07-80)
Avail: CASI HC A02/MF A03

This novel structure is a heterojunction phototransistor which can be used as an emitter-detector, and when placed in a quiescent mode, the device becomes a passive transmitter. By varying the voltage bias, this novel device will switch between all three modes of operation. Such a device has broad application in network environments with operation speeds of less than 50 MHz and distances of less than 1 km, e.g. automobiles, airplanes, and intra-instrumentation. During this period, the emission mode for this device was studied and mathematically modeled. Author (revised)

FIBER OPTIC SENSORS FOR CORROSION DETECTION c74
Alphonso C. Smith *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 179-182 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

The development of fiber optic sensors for the detection of a variety of material parameters has grown tremendously over the past several years. Additionally, the potential for analytical applications of fiber optic sensors have become more widely used. New pH sensors have also been developed using fiber optic techniques to detect fluorescence characteristics from immobilized fluorogenic reagent chemicals. The primary purpose of this research was to investigate the feasibility of using fiber optic sensors to detect the presence of Al(sup 3+) ions made in the process of environmental corrosion of aluminum materials. The Al(sup 3+) ions plus a variety of other type of metal ions can be detected using analytical techniques along with fiber optic sensors. Author (revised)

INVESTIGATION OF SPECTRAL ANALYSIS TECHNIQUES FOR RANDOMLY SAMPLED VELOCIMETRY DATA c70
Dave Sree *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 183-186 (For primary document see N94-27893 07-80)
Avail: CASI HC A01/MF A03

It is well known that velocimetry (LV) generates individual realization velocity data that are randomly or unevenly sampled in time. Spectral analysis of such data to obtain the turbulence spectra, and hence turbulence scales information, requires special techniques. The 'slotting' technique of Mayo et al, also described by Roberts and Ajmani, and the 'Direct Transform' method of Gaster and Roberts are well known in the LV community. The slotting technique is faster than the direct transform method in computation. There are practical limitations, however, as to how a high frequency and accurate estimate can be made for a given mean sampling rate. These high frequency estimates are important in obtaining the microscale information of turbulence structure. It was found from previous studies that reliable spectral estimates can be made up to about the mean sampling frequency (mean data rate) or less. If the data were evenly samples, the frequency range would be half the sampling frequency (i.e. up to Nyquist frequency); otherwise, aliasing problem would occur. The mean data rate and the sample size (total number of points) basically limit the frequency range. Also, there are large variabilities or errors associated with the high frequency estimates from randomly sampled signals. Roberts and Ajmani proposed certain pre-filtering techniques to reduce these variabilities, but at the cost of low frequency estimates. The prefiltering acts as a high-pass filter. Further, Shapiro and Silverman showed theoretically that, for Poisson sampled signals, it is possible to obtain alias-free spectral estimates far beyond the mean sampling frequency. But the question is, how far? During his tenure under 1993 NASA-ASEE Summer Faculty Fellowship Program, the author investigated from his studies on the spectral analysis techniques for randomly sampled signals that the spectral estimates can be enhanced or improved up to about 4-5 times the mean sampling frequency by using a suitable prefiltering technique. But, this increased bandwidth comes at the cost of the lower frequency estimates. The studies further showed that large data sets of the order of 100,000 points, or more, high data rates, and Poisson sampling are very crucial for obtaining reliable spectral estimates from randomly sampled data, such as LV data. Some of the results of the current study are presented. Author

COMPARATIVE ANALYSIS OF DIFFERENT CONFIGURATIONS OF PLC-BASED SAFETY SYSTEMS FROM RELIABILITY POINT OF VIEW c38

Moiez A. Tapia *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 187-188 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

The study of a comparative analysis of distinct multiplex and fault-tolerant configurations for a PLC-based safety system from a reliability point of view is presented. It considers simplex, duplex and fault-tolerant triple redundancy configurations. The standby unit in case of a duplex configuration has a failure rate which is k times the failure rate of the standby unit, the value of k varying from 0 to 1. For distinct values of MTTR and MTTF of the main unit, MTBF and availability for these configurations are calculated. The effect of duplexing only the PLC module or only the sensors and the actuators module, on the MTBF of the configuration, is also presented. The results are summarized and merits and demerits of various configurations under distinct environments are discussed. Author (revised)

PROPERTY ENCHANCEMENT OF POLYIMIDE FILMS BY WAY OF THE INCORPORATION OF LANTHANIDE METAL IONS Abstract Only c27

David W. Thompson *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 189 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

Lanthanide metal ions were incorporated into the polyimide derived from 2,2-bis(3,4-dicarboxyphenyl) hexafluoropropane dianhydride (6FDA) and 1,3-bis(aminophenoxy) benzene (APB) in an attempt to produce molecular level metal-polymer composites. The lanthanide series of metal ions (including aluminum, scandium, and yttrium) provide discrete and stable metal ions in the 3+ oxidation state. Throughout the series there is a uniform variation in ionic size ranging from 50 pm for aluminum to a maximum of 103.4 pm for cerium and gradually decreasing again to 84.8 pm for lutetium. The high charge-to-size ratio for these ions as well as the ability to obtain large coordination numbers makes them excellent candidates for interacting with the polymer substructure. The distinct lack of solubility of simple lanthanide salts such as the acetates and halides has made it difficult to obtain metal ions distributed in the polymer framework as discrete ions or metal complexes rather than microcomposites of metal clusters. (Lanthanum nitrates are quite soluble, but the presence of the strongly oxidizing nitrate ion leads to serious degradation of the polymer upon thermal curing. This work was successful at extending the range of soluble metals salts by using chelating agents derived from the beta-diketones dipivaloylmethane, dibenzoylmethane, trifluoroacetylacetone, and hexafluoroacetylacetone. Metal acetates which are insoluble in dimethylacetamide dissolve readily in the presence of the diketones. Addition of the polyimide yields a homogeneous resin which is then cast into a clear film. Upon curing clear films were obtained with the dibenzoylmethane and trifluoroacetylacetone ligands. The dipavaloylmethane precipitates the metal during the film casting process, and hexafluoroacetylacetone gives cured films which are deformed and brittle. These clear films are being evaluated for the effect of the metal ions on the coefficient of thermal expansion, resistance to atomic oxygen, and on selective gas permeability. Much more commonly than above, polyimide films are prepared by casting the film as the poly(amic acid) precursor which is then converted to the imidized form during the thermal cure cycle. Very limited success was achieved in the past in adding lanthanide metal ions to the amide precursors because of gellation and lack of solubility. With the use of the diketone ligands cited above, the solubility and gellation problems were overcome. However, the films after curing were clear but unacceptably brittle. Attempts to overcome this cure embrittlement problem are in progress.

ADP ANALYSIS PROJECT FOR THE HUMAN RESOURCES MANAGEMENT DIVISION c61

Robert L. Tureman, Jr. *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 190-191 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

The ADP (Automated Data Processing) Analysis Project was conducted for the Human Resources Management Division (HRMD) of NASA's Langley Research Center. The three major areas of work in the project were computer support, automated inventory analysis, and an ADP study for the Division. The goal of the computer support work was to determine automation needs of Division personnel and help them solve computing problems. The goal of automated inventory analysis was to find a way to analyze installed software and usage on a Macintosh. Finally, the ADP functional systems study for the Division was designed to assess future HRMD needs concerning ADP organization and activities. Author

SPACE TRANSPORTATION VEHICLE DESIGN EVALUATION USING SATURATED DESIGNS c16

Resit Unal *In its* The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 192-193 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

An important objective in the preliminary design and evaluation of space transportation vehicles is to find the best values of design variables that optimize the performance characteristic (e.g. dry weight). For a given configuration, the vehicle performance can be determined by the use of complex sizing and performance evaluation computer programs. These complex computer programs utilize iterative algorithms and they are generally too expensive and/or difficult to use directly in multidisciplinary design optimization. An alternative is to use response surface methodology (RSM) and obtain quadratic polynomial approximations to the functional relationships between performance characteristics and design variables. In RSM, these approximation models are then used to determine optimum design parameter values and for rapid sensitivity studies. Constructing a second-order model requires that 'n' design parameters be studied at least at 3 levels (values) so that the coefficients in the model can be estimated. There, 3(n) factorial experiments (point designs or observations) may be necessary. For small values of 'n' such as two or three, this design works well. However, when a large number of design parameters are under study, the number of design points required for a full-factorial design may become excessive. Fortunately, these quadratic polynomial approximations can be obtained by selecting an efficient design matrix using central composite designs (CCD) from design of experiments theory. Each unique point design from the CCD matrix is then conducted using computerized analysis tools (e.g. POST, CONSIZ, etc.). In the next step, least squares regression analysis is used to calculate the quadratic polynomial coefficients from the data. However, in some multidisciplinary applications involving a large number of design variables and several disciplines, the computerized performance synthesis programs may get too time consuming and expensive to run even with the use of efficient central composite designs. In such cases, it may be preferable to keep the number of design points to an absolute minimum and trade some model accuracy with cost. For this purpose, another class of experimental designs, called saturated D-optimal designs may be utilized for generating a matrix of vehicle designs. A design is called saturated when the number of design points is exactly equal to the number of terms in the model to be fitted. As a result, saturated designs require the absolute minimum number of design points $((n+1)(n+2)/s)$ to estimate the quadratic polynomial model coefficients. Saturated designs can be generated using the D-optimality criterion. A good saturated design should give rise to least squares estimates with minimum generalized variance. Author (revised)

PREDICTION OF LEADING-EDGE TRANSITION AND RELAMINARIZATION PHENOMENA ON A SUBSONIC MULTI-ELEMENT HIGH-LIFT SYSTEM **c02**

C. P. vanDam *In* Old Dominion Univ., The 1993 NASA-ODU American Society for Engineering Education (ASEE) Summer Faculty Fellowship Program Dec. 1993 p 194-195 (For primary document see N94-27893 07-80)

Avail: CASI HC A01/MF A03

Boundary-layer transition and relaminarization may have a critical effect on the flow development about multi-element high-lift systems of subsonic transport jets with swept wings. The purpose of the research is to study these transition phenomena in the leading-edge region of the various elements of a high-lift system. The flow phenomena studied include transition to the attachment-line flow, relaminarization, and crossflow instability, and transition. The calculations are based on pressure distributions measured in flight on the NASA Transport Systems Research Vehicle (Boeing 737-100) at a wing station where the flow approximated infinite swept wing conditions. The results indicate that significant regions of laminar flow can exist on all flap elements in flight. In future flight experiments (planned for January-February, 1994) the extent of these regions, the transition mechanisms and the effect of laminar flow on the high-lift characteristics of the multi-element system will be further explored. A COST MODEL FOR USAF ACQUISITION OF COMMERCIAL AIRCRAFT FOR SERVICE IN THE SPECIAL AIR MISSION FLEET M.S. Thesis

C. G. McVicker, III and Michael T. Roche 4 Jun. 1993 102 p

(AD-A274012; AFIT/GCA/LAS/93S-8) Avail: CASI HC A06/MF A02

The purpose of this research was to develop a cost estimating model which would allow cost estimators the ability to quickly and accurately estimate the acquisition of Air Force Special Air Mission fleet aircraft. The literature review revealed studies, government contracts, and trade publications which served as source data. This information was supplemented by interviews with acquisition specialists and contractors and incorporated into a database. Several estimating techniques were created and used to estimate the various cost elements. The Commercial Aircraft Integrated Cost Estimating Tool (CAICET) model was then developed to incorporate the estimating techniques with the database. This was accomplished by integrating dialog boxes to access the information and estimate the program acquisition. The CAICET model provides the analyst with the ability to estimate an acquisition program based on a few specific parameters concerning the missionization of the aircraft. These parameters include interior configuration, avionics, mission communications, and self-sufficiency items. Once this information is input, the CAICET model provides the analyst with a real-time estimate in standard AF Form 1537 format. DTIC

DEVELOPMENT OF THE AIR FORCE CONTINGENCY CONTRACTING COURSE FRAMEWORK M.S. Thesis

David A. Bethany and Michael A. Miller Sep. 1993 117 p

(AD-A273921; AFIT/GCM/LAS/93S-1) Avail: CASI HC A06/MF A02

The objective of this research was to develop a framework for a standardized Air Force Contingency Contracting course. This task was undertaken due to the occurrence of a common recommendation calling for specialized training in Contingency Contracting. The recommendation was found in several AFIT theses, as well as, various after action reports generated due to the experience gained during Operation Desert Shield/Storm and Hurricane Andrew. This thesis answered the basic questions of need, content, and structure for a future course in Contingency Contracting. Using an exploratory research design, the research team was able to conduct an extensive analysis on completed formalized research in the area of Contingency Contracting. The outcome of the research is a four-phased, block of instruction with recommended training topics and first hand accounts of contingency contracting. The blocks of instruction can be used alone or as a segment in current DOD Contracting Courses. DTIC

COORDINATED SCHEDULING FOR DYNAMIC REAL-TIME SYSTEMS Final Report

Swaminathan Natarajan and Wei Zhao 21 Feb. 1994 11 p

(Contract NCC2-770; TEES Proj. 41590-CS)

(NASA-CR-195231; NAS 1.26:195231) Avail: CASI HC A03/MF A01

In this project, we addressed issues in coordinated scheduling for dynamic real-time systems. In particular, we concentrated on design and implementation of a new distributed real-time system called R-Shell. The design objective of R-Shell is to provide computing support for space programs that have large, complex, fault-tolerant distributed real-time applications. In R-shell, the approach is based on the concept of scheduling agents, which reside in the application run-time environment, and are customized to provide just those resource management functions which are needed by the specific application. With this approach, we avoid the need for a sophisticated OS which provides a variety of generalized functionality, while still not burdening application programmers with heavy responsibility for resource management. In this report, we discuss the R-Shell approach, summarize the achievement of the project, and describe a preliminary prototype of R-Shell system. Author

BUSINESS PROCESS REDESIGN: DESIGN THE IMPROVED PROCESS M.S. Thesis

Jerry L. Warwick Sep. 1993 155 p

(AD-A274947) Avail: CASI HC A08/MF A02

This thesis reports the results of a business activity modeling exercise to explore how a functional manager in DoD can best improve and redesign one's business processes. The validity of exercise results was assessed and found to be generally accurate with minor modifications. The business activity model was constructed by a faculty/student team in August of 1992, in support of DoD's Corporate Information Management (CIM) initiative. This team used an Integrated Definitions Language (IDEFO) supported software tool (Design/IDEF by Meta Software of Cambridge, Massachusetts) to construct their model. DTIC

ONE MACHINE SCHEDULING WITH DELAYED PRECEDENCE CONSTRAINTS

Egon Balas (Carnegie-Mellon Univ., Pittsburgh, PA.), Jan Karel Lenstra (Center for Mathematics and Computer Science, Amsterdam, Netherlands.), and Alkis Vazacopoulos (Carnegie-Mellon Univ., Pittsburgh, PA.) Feb. 1993 40 p
(Contract N00014-85-K-0198; NSF DDM-89-01495) (ISSN 0926-4493)
(PB93-237626; Memo-COSOR-93-04; ETN-94-94812) Avail: CASI HC A03/MF A01

The one machine scheduling problem with release and delivery times and the minimum makespan objective is investigated. The study is performed in the presence of constraints that for certain pairs of jobs require a delay between the completion of the first job and the start of the second. This problem arises in the context of the shifting bottleneck procedure for the general job shop scheduling problem, as a relaxation of the latter, tighter than the standard one machine relaxation. The difference between the two relaxations is explained. A modified longest tail heuristic, whose analysis identifies those situations that permit efficient branching is introduced. An optimization algorithm is developed. Embedding this algorithm into a modified version of the shifting bottleneck procedure that uses the tighter one machine relaxation results in a performance improvement on all classes of job shop scheduling problems. ANALYSIS OF COST AND SCHEDULE GROWTH ON SOLE SOURCE AND COMPETITIVE AIR FORCE CONTRACTS M.S. Thesis

Klaes W. Wandland and Gary P. Wickman Sep. 1993 108 p
(AD-A273920; AFIT/GSM/LAS/93S-20) Avail: CASI HC A06/MF A02

This study investigated if differences exist in the cost and schedule growth of competed versus sole source contracts. Prior studies concentrated mainly on estimated savings from competition at the time of contract award. This study expanded prior analysis by investigating the cost and schedule growth over the contract's period of performance. In addition to an analysis between competed and sole source contracts, this study investigated if differences exist between lower and higher risk contracts as well as lower and higher initial priced contracts. When comparing competed and sole source contracts the results were consistent, with sole source contracts exhibiting an average of 57% higher cost growth in all areas. Sole source contracts also exhibited a schedule growth that was over four times greater than the schedule growth of competed contracts. When comparing lower and higher initial priced contracts, the results were also consistent with higher priced contracts exhibiting higher cost growth than lower price contracts. The results were mixed when measured between lower and higher risk contracts however. DTIC

CONCEPTS AND METHODS OF MEASURING PRODUCTIVITY AT THE ORGANIZATION LEVEL M.S. Thesis

Maxie Y. Davis Sep. 1993 66 p
(AD-A273126) Avail: CASI HC A04/MF A01

This thesis addresses the concepts of productivity measurement. Productivity measurements are generally a ratio between outputs and inputs. The criteria for identifying and quantifying the output and input components are explored. The methodology used by the Bureau of Labor and Statistics are examined to provide insight into the application of the concepts of productivity measurement. Business and government sectors outputs are identified and partial and multifactor productivity measurements defined. Common methodologies for measuring productivity at the organization level are also outlined. These methodologies are examined for their applicability to phenomena of the post-industrial society, particularly the rise in the white collar work force, information technology, and process reengineering. Adaptations of these methodologies are proposed as an appropriate measurement technique for DOD functional managers. Author (DTIC)

SMALL BUSINESS INNOVATION RESEARCH PROGRAM SOLICITATION

15 Jun. 1994 78 p
(NASA-TM-109695; NAS 1.15:109695; SBIR-94-1) Avail: CASI HC A05/MF A01

The National Aeronautics and Space Administration invites eligible small business concerns to submit Phase 1 proposals for its 1994 Small Business Innovation Research (SBIR) Program, which is described in this twelfth annual NASA SBIR Program Solicitation. The 1994 solicitation period for Phase 1 proposals begins April 4, 1994 and ends June 15, 1994. Eligible firms with research or research and development capabilities (R/R&D) in any of the listed topic and subtopic areas are encouraged to participate. Through SBIR, NASA seeks innovative concepts addressing the program needs described in the SBIR solicitation subtopics and offering commercial application potential. This document contains program background information, outlines eligibility requirements for SBIR participants, describes the three SBIR program phases, and provides the information qualified offerors need to prepare and submit responsive proposals. PRACTICAL PROBLEMS IN AGGREGATING EXPERT OPINIONS

Jane M. Booker, Richard R. Picard, and Mary A. Meyer 1993 6 p
Presented at the 2nd Probabilistic Safety Assessment and Management Conference, San Diego, CA, 20-24 Mar. 1994
(Contract W-7405-eng-36)
(DE94-002623; LA-UR-93-3566; CONF-940312-38) Avail: CASI HC A02/MF A01

Expert opinion is data given by a qualified person in response to a technical question. In these analyses, expert opinion provides information where other data are either sparse or non-existent. Improvements in forecasting result from the advantageous addition of expert opinion to observed data in many areas, such as meteorology and econometrics. More generally, analyses of large, complex systems often involve experts on various components of the system supplying input to a decision process; applications include such wide-ranging areas as nuclear reactor safety, management science, and seismology. For large or complex applications, no single expert may be knowledgeable enough about the entire application. In other problems, decision makers may find it comforting that a consensus or aggregation of opinions is usually better than a single opinion. Many risk and reliability studies require a single estimate for modeling, analysis, reporting, and decision making purposes. For problems with large uncertainties, the strategy of combining as diverse a set of experts as possible hedges against underestimation of that uncertainty. Decision makers are frequently faced with the task of selecting the experts and combining their opinions. However, the aggregation is often the responsibility of an analyst. Whether the decision maker or the analyst does the aggregation, the input for it, such as providing weights for experts or estimating other parameters, is imperfect owing to a lack of omniscience. Aggregation methods for expert opinions have existed for over thirty years; yet many of the difficulties with their use remain unresolved. The bulk of these problem areas are summarized in the sections that follow: sensitivities of results to assumptions, weights for experts, correlation of experts, and handling uncertainties. The purpose of this paper is to discuss the sources of these problems and describe their effects on aggregation. DOE

NASA SBIR ABSTRACTS OF 1992, PHASE 1 PROJECTS

F. C. Schwenk (Futron Corp., Bethesda, MD.), J. A. Gilman (Futron Corp., Bethesda, MD.), J. B. Paige (Futron Corp., Bethesda, MD.), and S. M. Sacknoff (Futron Corp., Bethesda, MD.) Washington Sep. 1993 148 p
(NASA-TM-109694; NAS 1.15:109694; SBIR-92-2) Avail: CASI HC A07/MF A02

The objectives of 346 projects placed under contract by the Small Business Innovation Research (SBIR) program of the National Aeronautics and Space Administration (NASA) are described. These projects were selected competitively from among proposals submitted to NASA in response to the 1992 SBIR Program Solicitation. The basic document consists of edited, non-proprietary abstracts of the winning proposals submitted by small businesses. The abstracts are presented under the 15 technical topics within which Phase 1 proposals were solicited. Each project was assigned a sequential identifying number from 001 to 346, in order of its appearance in the body of the report. Appendixes to provide additional information about the SBIR program and permit cross-reference of the 1992 Phase 1 projects by company name, location by state, principal investigator, NASA Field Center responsible for management of each project, and NASA contract number are included. AUTOMATION LIFE-CYCLE COST MODEL Final Technical Report
Thomas P. Gathmann, Arlinda J. Reeves, Rick Cline, Max Henrion, and Corinne Ruokangas 2 Jul. 1992 169 p
(Contract NAS2-13419)
(NASA-CR-195695; NAS 1.26:195695; SSD92D0154) Avail: CASI HC A08/MF A02

The problem domain being addressed by this contractual effort can be summarized by the following list: Automation and Robotics (A&R) technologies appear to be viable alternatives to current, manual operations; Life-cycle cost models are typically judged with suspicion due to implicit assumptions and little associated documentation; and Uncertainty is a reality for increasingly complex problems and few models explicitly account for its affect on the solution space. The objectives for this effort range from the near-term (1-2 years) to far-term (3-5 years). In the near-term, the envisioned capabilities of the modeling tool are annotated. In addition, a framework is defined and developed in the Decision Modelling System (DEMOS) environment. Our approach is summarized as follows: Assess desirable capabilities (structure into near- and far-term); Identify useful existing models/data; Identify parameters for utility analysis; Define tool framework; Encode scenario thread for model validation; and Provide transition path for tool development. This report contains all relevant, technical progress made on this contractual effort. Author (revised)

NASA: MAJOR CHALLENGES FOR MANAGEMENT. TESTIMONY BEFORE THE LEGISLATION AND NATIONAL SECURITY SUBCOMMITTEE, COMMITTEE ON GOVERNMENT OPERATIONS, HOUSE OF REPRESENTATIVES
Frank C. Conahan 6 Oct. 1993 24 p
(GAO/T-NSIAD-94-18) Avail: CASI HC A03/MF A01

Presented is the statement of Frank C. Conahan before the House of Representatives on management issues and challenges facing the National Aeronautics and Space Administration. Issues covered are: bringing plans in line with likely budgets, managing systems development efforts more efficiently, improving operations and oversight, and preserving U.S. aeronautical leadership. Programs discussed include the space station, the Advanced X Ray Astrophysics Facility, the Earth Observing System, and the National Aerospace Plane. Topics discussed include reporting under the Financial Integrity Act and the need for a Chief Financial Officer, improving shuttle operating efficiency, improving procurement and contract management, space project testing, science data management, facilities maintenance, and environmental protection activities. DEFENSE FORCE MANAGEMENT: CHALLENGES FACING DOD AS IT CONTINUES TO DOWNSIZE ITS CIVILIAN WORK FORCE. REPORT TO THE CHAIRMAN, SUBCOMMITTEE ON FEDERAL SERVICES, POST OFFICE, AND CIVIL SERVICE, COMMITTEE ON GOVERNMENTAL AFFAIRS, US SENATE
Feb. 1993 18 p
(GAO/NSIAD-93-123; B-247621) Avail: CASI HC A03/MF A01; also available from GAO, PO Box 6015, Gaithersburg, MD 20884-6015

In testimony given in Feb. 1992, important differences in the approaches that the Department of Defense (DOD) has employed to facilitate force reductions, minimize involuntary separations, and shape its civilian and military work forces were highlighted. This report builds on our statements in these testimonies in the following ways: (1) reporting on the status of DOD's civilian work force reductions, (2) contrasting the DOD's strategy for reducing the military work force with the strategy for reducing the civilian work force, and (3) providing information of DOD's implementation of the new authorizations for separation incentive programs. INTERTEMPORAL BARGAINING AND DYNAMIC CONSISTENCY
H. Ehtamo and J. Ruusunen Jun. 1993 31 p See also PB92-133826
(PB94-133147; ISBN-951-22-1623-X) Avail: CASI HC A03/MF A01

This paper proposes a model for intertemporal bargaining over two periods. At the first period the bargaining game is defined by the set of the decision makers' feasible total gains over the two periods, and the contract is an element of this set. At the second period the contract is renegotiated taking into account the decision makers' gains from the first period. The choice of the contract is made at each period on the basis of an a priori specified axiomatic bargaining model. The paper gives a definition for the dynamic consistency of the contract. This concept is important in intertemporal economic problems, but thus far it has not been considered in the context of multiperiod bargaining. A remarkable result of the paper is the paradoxical conclusion that to obtain dynamic consistency of the bargaining solution, the controversial independence of irrelevant alternatives property of the axiomatization must be accepted. THE EFFECT OF THE TIME RESTRICTIONS ON INFORMATION SEARCH AND INFORMATION INTEGRATION IN A DYNAMIC TASK ENVIRONMENT Final Report
J. H. Kerstholt and P. Willems 13 Jul. 1993 20 p
(AD-A273759; IZF-1993-B-8; TDCK-TD-93-1359) Avail: CASI HC A03/MF A01

To date, research has mainly used deadlines in static task environments to investigate the effects of time pressure on decision making behavior. A dynamic environment, on the other hand, changes over time and time pressure may result when time is not used efficiently and negative consequences are rapidly increasing. An experiment was carried out to investigate the effects of time horizon on decision making behavior in a dynamic task environment. Subjects were required to monitor the fitness level of a running athlete, depicted graphically on a computer screen, and to apply a proper treatment whenever necessary. Information could be requested on symptoms, which were probabilistically related to underlying causes. The time horizon was manipulated by the speed at which the athlete's fitness level changed over time. Restrictions in time horizon did not affect the amount and type of information that was requested, and the diagnoses became even better. Nevertheless, more athletes collapsed in the more restricted time horizon conditions. In the short time horizon conditions subjects furthermore employed a more cautious decision strategy. As far as the use of time was concerned it was found that information processing was speeded up, but subjects waited relatively the same amount of time before they started to intervene with the system. STANDARDIZING EXCHANGE FORMATS
H. D. Lemmel and J. J. Schmidt 1992 25 p Presented at the 11th International CODATA Conference: Scientific and Technical Data in A New Era, Karlsruhe, Germany, 26-29 Sep. 1988 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616798; INIS-mf-13438; CONF-880907) Avail: CASI HC A03 (US Sales Only)

An international network of co-operating data centers is described who maintain identical data bases which are simultaneously updated by an agreed data exchange procedure. The agreement covers 'data exchange formats' which are compatible to the centers' internal data storage and retrieval systems which remain different, optimized at each center to the available computer facilities and to the needs of the data users. Essential condition for the data exchange is an agreement on common procedures for the data exchange is an agreement on common procedures for the data compilation, including critical data analysis and validation. The systems described ('EXFOR', 'ENDF', 'CINDA') are used for 'nuclear reaction data', but the principles used for data compilation and exchange should be valid also for other data types. DOE

PERFORMANCE MEASUREMENT OF THREE COMMERCIAL OBJECT-ORIENTED DATABASE MANAGEMENT SYSTEMS M.S. Thesis
Timothy J. Halloran Dec. 1993 260 p
(AD-A274028; AFIT/GCS/ENG/93D-12) Avail: CASI HC A12/MF A03

The goal of this thesis was to study the performance of three commercial object-oriented database management systems. The commercial systems studied included: Itasca, sold by Itasca Systems Incorporated; Matisse, sold by Intellitic International; and ObjectStore, sold by Object Design Incorporated. To examine performance of these database management systems two benchmarks were run: the OO1 benchmark and a new AFIT Simulation benchmark. The OO1 benchmark was designed, implemented, and run on all three database management systems. ObjectStore was our top performer on all configurations of the OO1 benchmark. The AFIT Simulation benchmark was designed, implemented, and run on the ObjectStore database management system. A nonpersistent version of the benchmark was also created in the C++ programming language. There was minimal performance overhead incurred due to the use of ObjectStore, especially when compared to the functional benefits gained. We concluded that there are major differences between the performance levels offered in current commercial object-oriented database management systems. We also concluded that a programming language interface to an object-oriented database management system should not be middle ground. Either it should be closely tied to a specific language or not tied to a specific language at all. DTIC

FULL-TEXT INFORMATION SERVICES AT THE DESKTOP
J. R. Judy 1993 6 p Presented at the INFOTECH 1993, Oak Ridge, TN, 20-23 Oct. 1993
(Contract DE-AC06-76RL-01830)
(DE94-003728; PNL-SA-22626; CONF-9310145-5) Avail: CASI HC A02/MF A01

In order to develop true electronic information services, libraries will be called upon to deliver a wide array of full-text documents to users' desktop computers. This requirement can currently be seen in the demands for electronic access to the ever-growing array of federal, state and local regulations covering almost any activity at DOE sites. The Hanford Technical Library has put together a new online statutory and regulatory information service, SARIS, that is described in this paper. SARIS is expected to serve as a platform fort the delivery of additional full-text information sources in the future. DOE

A DIAGNOSTIC CLASSIFICATION MODEL FOR DOCUMENT PROCESSING SKILLS Final Report, Apr. 1989 - Aug. 1993
Kathleen Sheehan, Kikumi Tatsuoka, and Charles Lewis Oct. 1993 41 p
(Contract N00014-90-J-1307)
(AD-A273790; ETS-RR-93-39-ONR) Avail: CASI HC A03/MF A01

This paper introduces a modification to the Rule Space diagnostic classification procedure which allows for processing of response vectors containing missing data. Rule Space is an approach to diagnostic classification which involves characterizing examinees' performances in terms of an underlying cognitive model of generalized problem-solving skills. It has two components: a procedure for determining a comprehensive set of knowledge states, where each state is characterized in terms of a unique subset of mastered skills; and a procedure for classifying examinees into one or another of the specified states. The procedure for determining a comprehensive set of knowledge states is based on the Boolean descriptive function given in Tatsuoka. The procedure for classifying examinees involves comparing examinees' scored response vectors to the patterns expected within each of the specified knowledge states. Missing data is expected to be a common problem for this approach because, although the procedure for determining the comprehensive set of knowledge states requires a large pool of items, the procedure for examinee classification can be performed with smaller (less expensive) item subsets. This approach to diagnostic classification is illustrated with data collected in the Survey of Young Adult Literacy, a nationwide survey of literacy skills conducted by the National Assessment of Educational Progress (NAEP) in 1985. RENDERING OF THREE-DIMENSIONAL DATA SETS DERIVED FROM FINITE-DIFFERENCE AND SPECTRAL METHODS M.S. Thesis
Paul A. Schubert Dec. 1993 81 p
(AD-A273724; AFIT/GAE/ENY/93D-24) Avail: CASI HC A05/MF A01

The timely visualization of three-dimensional data sets and the advantages of using a spectral method solution versus a finite-difference method solution in rendering isosurfaces is described. The Beam-Warming numerical algorithm, which uses implicit-approximate-factorization, is used to generate the steady-state solutions for a model diffusion-convection problem. The Chebyshev collocation operator is used to evaluate the right-hand side of the Beam-Warming algorithm for the spectral solution. Comparing the model problem results with the exact solution, the spectral series solution is truncated to the same degree of accuracy as the finite-difference for comparison of rendering times. The rendering algorithm employs octrees to efficiently traverse the data set to fit the isosurfaces. The actual fitting of polygons to the isosurface uses the marching cubes table look up algorithm. With the spectral series solution, interval math is investigated for guaranteed detection of isosurfaces during the initial octree traversal(s). DTIC

USING DATABASE TECHNOLOGY TO SUPPORT DOMAIN-ORIENTED APPLICATION COMPOSITION SYSTEMS M.S. Thesis
Danny A. Cecil and Joseph A. Fullenkamp Dec. 1993 219 p
(AD-A274091; AFIT/GCS/Eng/93D-03) Avail: CASI HC A10/MF A03

This research designed and prototyped an OODBMS technology base to store and retrieve various types of domain artifacts for domain-oriented application composition systems (DOACS). We developed object-oriented database schemas for a validating domain and the Object-Connection-Update software architecture. We implemented an inheritance relationship between the schemas so a domain model can inherit an architectural structure from an architecture model allowing us to isolate domain-specific knowledge from architecture-specific knowledge. We also developed a meta-model to formally define domain models in the database. We then developed a set of database methods to transform a domain model into a database schema for storing artifacts from the domain and to automatically populate the DOACS object base with the domain definition. Using an OODBMS, the structure and relationships that provide much of the power in object models are retained because the artificial flattening required for storage in traditional databases and file systems is prevented. Isolating domain and architecture models from each other has greatly increased the reusability of the domain artifacts, the domain model, and the architecture model. The inheritance relationship between domain and architecture models allows a domain to be defined once, but used in many different architectural environments and vice versa. DTIC

CODE DIVISION MULTIPLE ACCESS LOCAL AREA NETWORK COMMUNICATIONS EMPLOYING FIBER OPTIC SIGNAL PROCESSING TECHNIQUES M.S. Thesis
Bruce A. Legge Sep. 1993 81 p
(AD-A274897) Avail: CASI HC A05/MF A01

This thesis investigated the feasibility of implementing a code division multiple access (CDMA) local area network (LAN) employing all-optical signal processing. A two-user unidirectional data link was built and successfully tested. This data link utilized variations of optical orthogonal code sequences (OOC's) generated by serially connected fiber optic delay lines and 2x2 couplers. A special feature of this network design was use of the same hardware to decode the signal as was used to encode the signal. A detailed review of the various coding techniques and the generation of spread spectrum signals was also performed. The results of the overall system design effort demonstrated that high-data-rate signal traffic can be supported by the network and in a more power efficient and affordable manner than previous designs. DESIGN AND SPECIFICATION OF THE XPRESS TRANSFER HIGH-SPEED PROTOCOL M.S. Thesis
David J. Sacha Sep. 1993 100 p
(AD-A274941) Avail: CASI HC A05/MF A02

The use of fiber optics in high-speed data networks has significantly increased throughput and reliability at the physical layer. Consequently, the transport layer has become a bottleneck to the data transfer potential of high-speed networks. This bottleneck has forced an investigation of transport protocols and standards to be used in future networks. The Xpress Transfer Protocol (XTP) is a transport layer protocol designed to perform efficiently in networks where high data rates, densely packed bit pipes, and low bit error rates are normal operating conditions. However, XTP is a relatively new protocol which has not yet undergone extensive testing and analysis to verify its ability to resolve the transport layer bottleneck. In this thesis the specification and analysis of the XTP protocol using the System of Communicating Machines (SCM) model is presented. A comparison is then made with an alternative high-speed protocol called SNR, originated at AT&T Bell Labs. Based on this study, it is concluded that the XTP protocol provides several mechanisms, such as rate control and extended sequence numbering, that should be included in developing high-speed transport protocols. Furthermore, it is concluded that XTPs flexible characteristics allow for multiple paradigm implementations at the cost of some complexity, making a more complete analysis of this protocol difficult. As work on high-speed transport protocols continues, many of the XTP mechanisms should be considered for inclusion into evolving standards. It is also concluded that there are some critical features for high-speed protocols that are not in XTP. DTIC

DESIGN AND IMPLEMENTATION OF A QUERY EDITOR FOR THE AMADEUS SYSTEM M.S. Thesis
Turgay Cince Sep. 1993 164 p
(AD-A274955) Avail: CASI HC A08/MF A02

One side effect of the proliferation of relational databases within a single organization is that sharing of data to access a global information base is difficult. People erroneously assume that since almost all of the commercially available RDBMS's support the Structured Query Language (SQL), sharing of data is easy. Unfortunately, currently available systems only support a specific dialect of SQL. The Amadeus front-end system overcomes the data-sharing problem. With the Amadeus front-end system, database users can use one common language called Dataflow Query Language (DFQL) to access heterogeneous RDBMS's. A query specified in DFQL is correctly translated into a SQL dialect that the connected RDBMS recognizes. With this front-end approach, the user can access data from multiple databases by writing a single DFQL query, instead of writing multiple SQL queries. A prototype query builder is re-implemented using an object-oriented design. This component of Amadeus interacts with the user for creating DFQL queries. DTIC

INFORMATION SYSTEMS CRITERIA FOR APPLYING SOFTWARE REENGINEERING: GUIDELINES FOR IDENTIFYING INFORMATION SYSTEMS FOR SOFTWARE REENGINEERING Final Report
Tamra K. Moore 13 May 1993 97 p
(AD-A274699) Avail: CASI HC A05/MF A02

Knowing when to reengineer is the key to helping managers make decisions that are cost effective and beneficial to reaching their organizational goals. The Software Reengineering Criteria provides assistance in identifying automated information systems (AIS) that are candidates for reengineering and proposes how software reengineering technology can benefit AIS. Experiences in industry, government agencies, and academia fostered the development of this criteria for identifying candidate information systems for software reengineering. This paper presents the Software Reengineering Criteria in four parts. First, a set of terms defines the activities within reengineering technology. An overview summarizes other sources providing guidance for when to reengineer. The criteria characterizes software systems and software engineering environments that exhibit the potential to benefit from reengineering technology and presents recommendations for software reengineering strategies. Finally, potential application areas for the criteria are explored. DTIC

NUMERICAL TREATMENT OF EXPERIMENTAL DATA IN CALIBRATION PROCEDURES
C. Moreno Jun. 1993 17 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-634289; IC-93/122) Avail: CASI HC A03 (US Sales Only)

A discussion of a numerical procedure to find the proportionality factor between two measured quantities is given in the framework of the least-squares method. Variable, as well as constant, amounts of experimental uncertainties are considered for each variable along their measured range. The variance of the proportionality factor is explicitly given as a closed analytical expression valid for the general case. Limits of the results obtained here have been studied allowing comparisons with those obtained using classical least-squares expressions. Analytical and numerical examples are also discussed. DOE

INTERNATIONAL ENERGY: RESEARCH ORGANIZATIONS, 1988-1992
P. Hendricks, ed. and S. Jordan, ed. Jun. 1993 579 p Revised Limited Reproducibility: More than 20% of this document may be affected by poor print
(DE93-017267; ETDE/PUB-3-Rev-1) Avail: Issuing Activity (Department of Energy (DOE))

This publication contains the standardized names of energy research organizations used in energy information databases. Involved in this cooperative task are the two following groups: (1) the technical staff of the US DOE Office of Scientific and Technical Information (OSTI) in cooperation with the member countries of the Energy Technology Data Exchange (ETDE); and (2) the International Nuclear Information System (INIS). ETDE member countries are also members of the International Nuclear Information System (INIS). Nuclear organization names recorded for INIS by these ETDE member countries are also included in the ETDE Energy Database. Therefore, these organization names are cooperatively standardized for use in both information systems. This publication identifies current organizations doing research in all energy fields, standardizes the format for recording these organization names in bibliographic citations, assigns a numeric code to facilitate data entry, and identifies report number prefixes assigned by these organizations. These research organization names may be used in searching the databases 'Energy Science & Technology' on DIALOG and 'Energy' on STN International. These organization names are also used in USDOE databases on the Integrated Technical Information System. Research organizations active in the past five years, as indicated by database records, were identified to form this publication. This directory includes approximately 31,000 organizations that reported energy-related literature from 1988 to 1992 and updates the DOE Energy Data Base: Corporate Author Entries. DOE

PDEF: A STANDARD FILE FORMAT FOR DATA INTERCHANGE
Michael McDonnell Jan. 1994 11 p
(AD-A274694; TEC-R-203) Avail: CASI HC A03/MF A01

The Protean Data Exchange Format (PDEF) is a set of computer programs which can be used to transform data between different systems which do not understand each other's formats. The problem of data transformation is not restricted to any particular discipline, but those of us concerned with digital terrain data have felt this problem acutely as we have found that different Geographic Information Systems (GIS) cannot use each other's data. Although PDEF was written to alleviate this particular problem, its uses are more general than the specific problem for which it was originally written. PDEF was designed primarily to be easy to use since reformatting decisions must be made by people. This report will examine both the format and the uses of PDEF. DTIC

A GEOLOGICAL AND GEOPHYSICAL INFORMATION SYSTEM FOR EURASIA Final Technical Report, 30 Jul. 1991 - 31 Aug. 1993
Eric J. Fielding, Muawia Barazangi, and Bryan L. Isacks 15 Dec. 1993 39 p
(Contract F29601-91-K-DB08)
(AD-A274818) Avail: CASI HC A03/MF A01

Topography and heterogeneous crustal structure have major effects on the propagation of regional seismic phases. We are collecting topographical, geological, and geophysical datasets for Eurasia into an information system that can be accessed via Internet connections. Now available are digital topography, satellite imagery, and data on sedimentary basins and crustal structure thicknesses. New datasets for Eurasia include maps of depth to Moho beneath Europe and Scandinavia. We have created regularly spaced grids of the crustal thickness values from these maps that can be used to create profiles of crustal structure. These profiles can be compared by an analyst or an automatic program with the crustal seismic phases received along the propagation path to better understand and predict the path effects on phase amplitudes, a key to estimating magnitudes and yields, and for understanding variations in travel-time delays for phases such as Pn, which are important for improving regional event locations. The gridded data could also be used to model propagation of crustal phases in three dimensions. DTIC

MODELING AND SIMULATION OF A FIBER DISTRIBUTED DATA INTERFACE LOCAL AREA NETWORK M.S. Thesis
Aldo B. Schenone 23 Sep. 1993 54 p
(AD-A274838) Avail: CASI HC A04/MF A01

In this thesis, the performance of the fiber distributed data interface (FDDI) local area network is evaluated by software simulation. The network is modeled with OPNET, a communication network simulation tool. The main focus of the model is on the medium access control (MAC) and the timing requirements that need to be met for the correct behavior of the protocol. Simulation data is presented to support results from previous analytic studies of distinctive features of the protocol, including the behavior of the token rotation time, synchronous frame delays, fairness of channel access for nodes transmitting asynchronous traffic, etc. Comparisons between the simulated and theoretical results confirm the accuracy of the OPNET simulation tools and demonstrate that it may be used to model other protocols of particular interest. DTIC

LONG TERM LEARNING: INTEGRATION OF KNOWLEDGE ACQUISITION AND KNOWLEDGE COMPILATION Quarterly Progress Report No. 4, 1 Apr. - 30 Jun. 1993
Kurt VanLehn 14 Jan. 1994 6 p
(Contract N00014-92-J-1945)
(AD-A274775) Avail: CASI HC A02/MF A01

This Report is the initial quarterly progress report for grant N00014-92-J-1945, entitled 'Long Term Learning: Integration of Knowledge Acquisition and Knowledge Compilation.' It covers the period from 1 Jul. 1992 to 30 Sep. 1992. Two major objectives were achieved during this report period. The first was to consolidate our understanding of the sources of the learning that occurred in the protocols of 9 subjects learning physics over a period of about 5 hours each. These protocols were first analyzed by Micki Chi and her colleagues then modelled by my group. Despite some considerable effort, no one had ever been able to isolate the exact places where the subjects' beliefs shifted. During this report period, we conducted a large number of protocol analyses aimed at isolating and quantifying the subjects' knowledge acquisition. We eventually found evidence for 3 different acquisition processes. DTIC

DESIGN CONSIDERATIONS WHEN USING EXTERNAL HYPERTEXT ENGINES FROM APPLICATIONS

B. Sutter and J. Vercellone 1993 5 p Presented at the 2nd Annual Workshop on Intelligent Hypertext Conference on Information and Knowledge Management, Washington, DC, 1-5 Nov. 1993
(Contract W-31-109-eng-38)
(DE94-002213; ANL/DIS/CP-81102; CONF-9311118-1) Avail: CASI HC A01/MF A01

More and more applications today are employing the advantages available from the advances in hypertext to better impart information to the user. This position paper addresses experiences with the specific case of an information application using an 'external' hypertext 'engine' to reference large textual documents that are regularly changing. As hypertext engines take on a role of 'text servers' that can appear seamlessly in other applications, we can benefit from lessons learned in code reuse regarding extensibility, expandability and portability. If a text referenced by an application was static, the interface between the application and the hypertext engine would be simple. However, a changing reference document can induce unacceptable life-cycle costs for an application that needs to employ external hypertext engines to display the referenced text. This paper will present solutions to this problem that were developed when building an information system that would run on an 'ordinary' PC. DOE

AUTOMATED INFORMATION MANAGEMENT FOR DESIGNERS: FUNCTIONAL REQUIREMENTS FOR COMPUTER BASED ASSOCIATES THAT SUPPORT ACCESS AND USE OF TECHNICAL INFORMATION IN DESIGN Final Report, Sep. 1986 - Mar. 1992
William J. Cody, William B. Rouse, and Kenneth R. Boff Mar. 1993 126 p
(Contract F33615-86-C-0542)
(AD-A274603; AL/CF-TR-1993-0069) Avail: CASI HC A07/MF A02

The purpose of this program was to analyze the process of complex system design to determine why designers often fail to consider potentially valuable technical information in making design decisions. Based on this analysis, the goal was to define functional requirements for a new class of supports that will enhance designers' access and use of such information. Termed Designer's Associates, these supports derive from a thorough understanding of designer's tasks and the services that intelligent computing technologies make possible. DTIC

RETRIEVAL USING PLAUSIBLE INFERENCE Final Technical Report, 15 Aug. 1991 - 14 Aug. 1993
W. B. Croft Oct. 1993 8 p
(Grant AF-AFOSR-0324-91)
(AD-A274252; FTR-528996; AFOSR-93-0886TR) Avail: CASI HC A02/MF A01

The goal of this project was basic research and development in the area of text-based information systems. A new probabilistic model of text retrieval using Bayesian inference nets was proposed and extended. An efficient implementation of this model for large full-text databases resulted in the INQUERY indexing and retrieval engine. Retrieval experiments carried out using INQUERY and a variety of databases have shown that it produces high-quality results compared to other approaches. Significant progress was also made, both conceptually and with prototype implementations, in showing how text retrieval can be integrated with hypertext and database management systems in a single framework. The success of the INQUERY system in ARPA-sponsored evaluations led to a number of technology transfer projects. DTIC

Heap allocation with copying garbage collection is believed to have poor memory subsystem performance. A study of the memory subsystem performance of heap allocation for memory subsystems found on many machines was conducted. It was found that many machines support heap allocation poorly. However, with the appropriate memory subsystem organization, heap allocation can have good memory subsystem performance. DTIC

BIBLIOGRAPHIC RETRIEVAL SYSTEM (BARS) SANDIA SHOCK COMPRESSION (SSC) DATABASE SHOCK PHYSICS INDEX (SPHINX) DATABASE, VOLUME 3
G. M. vonLaven (Advanced Software Engineering, Madison, AL.) and W. Herrmann Sep. 1993 71 p
(Contract DE-AC04-94AL-85000)
(DE94-001705; SAND-93-1422-Vol-3) Avail: CASI HC A04/MF A01

The Bibliographic Retrieval System (BARS) is a database management system specially designed to store and retrieve bibliographic references and track documents. The system uses INGRES to manage this database and user interface. It uses forms for journal articles, books, conference proceedings, theses, technical reports, letters, memos, visual aids, as well as a miscellaneous form which can be used for data sets or any other material which can be assigned an access or file number. Sorted output resulting from flexible BOOLEAN searches can be printed or saved in files which can be inserted in reference lists for use with word processors. DOE

ACTIVE DATABASE ARCHITECTURES AND THE DESIGN OF SENTINEL FOR CONSTRAINT MANAGEMENT Final Report, Mar. 1992 - Jul. 1993
Sharma Chakravarthy, E. Anwar, and L. Maugis Oct. 1993 77 p
(Contract F30602-92-C-0035)
(AD-A274205; RL-TR-93-190) Avail: CASI HC A05/MF A01

Over the last few years active databases have become an important research area geared towards meeting of the requirements of a variety of non-traditional applications. This report concentrates on providing a seamless incorporation of events and rules into an OODBMS with an emphasis on the modularity and extensibility of the resulting system. The report extends the monitoring view point to an external one, thereby allowing objects to monitor and react to changes occurring to their own state as well as changes occurring to other objects. This is accomplished by introducing a reactive asynchronous object interface. This interface enables objects to propagate pre-declared events occurring to their state to other objects, thereby enabling other objects to perform operations. In addition, a subscription and notification mechanism is introduced that allows event notification to be specified dynamically. This mechanism enables objects to selectively monitor other objects at run-time using the reactive interface. A design is proposed for the specification and detection of simple as well as complex events. This report combines the strengths of the approaches taken in Ode and ADAM and extends them in several significant ways. DTIC

A METHOD FOR POPULATING THE KNOWLEDGE BASE OF AFIT'S DOMAIN-ORIENTED APPLICATION COMPOSITION SYSTEM M.S. Thesis
Russell M. Warner Dec. 1993 130 p
(AD-A274128; AFIT/GCS/Eng/93D-24) Avail: CASI HC A07/MF A02

This research developed a formal method for adding new domains to Architect, a domain-oriented application composition system being developed at the Air Force Institute of Technology (AFIT) to explore new software engineering technologies. Using canonical formal specifications of domain objects, Architect rapidly composes these specifications into a software application and executes a prototype of that application as a means to demonstrate its correctness before any programming language specific code is generated. Architect is implemented in the Software Refinery environment, which allows Architect to create and manipulate object-oriented specifications. As a part of this research effort, domain-oriented application composition systems were investigated in general. leading to the development of a general method for populating the knowledge base of systems of this type. This general population method was then used as a basis for creating a specific knowledge base population method for Architect. To validate this method, Architect was populated with the Digital Signal Processing domain. The correct implementation of this domain was verified by creating applications and comparing their execution to expected results. The addition of the Digital Signal Processing domain to Architect also serves to validate the usefulness and correctness of the Architect system. DTIC

PARALLEL STRING MATCHING ALGORITHMS

Dany Breslauer and Zvi Galil 1992 28 p
(Grant NSF CCR-90-14605)
(AD-A274502; CUCS-002-92) Avail: CASI HC A03/MF A01

The string matching problem is one of the most studied problems in computer science. While it is very easily stated and many of the simple algorithms perform very well in practice, numerous works have been published on the subject and research is still very active. In this paper recent results on parallel algorithms for the string matching problem are surveyed. DTIC

Each software system on a computer is generally composed from different layered software, such as operating systems, language processors and application programs. Any of those layers have to handle their own structured or organized data by themselves. Therefore, a technology to construct data structures which can be commonly used from different software layers is needed. It is defined that the information base is software which includes both static and dynamic representations of data. The information base should be commonly used by the different software layers. It is also defined that the provable information base is an information base where each software component in the information base is theoretically proved and the construction of a whole system is also theoretically proved. A technology for provable information base systems must be developed, since, by using the provable information base systems as software engines to manipulate all kinds of data, software engineers can only concentrate on the improvement of their own algorithms besides boring data handling problems. This survey includes extended abstracts of selected papers able to contribute to the construction of the provable information base systems. Author (NASDA)

QUERY OPTIMIZATION STRATEGIES FOR BROWSING SESSIONS

Martin L. Kersten and M. F. N. deBoer Dec. 1992 19 p Sponsored in part by EEC Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISSN 0169-118X)
(CWI-CS-R9268; ETN-94-95420) Copyright Avail: CASI HC A03

Techniques and experiments to obtain response time improvement for a browsing session, that is a sequence of interrelated queries to locate a subset of interest, are described. The optimization technique is based on a symbolic analysis of the query interdependencies and exploitation of (partial) query answers retained automatically. A prototype Browsing Session Optimizer (BSO) was constructed that runs as a front end to the Ingres relational system. Based on the experiments reported, a proposal to extend (existing) DBMS's (Data Base Management Systems) with a mechanism to keep and reuse small answers by default is made. Such investments quickly pay off in sessions with interrelated queries. The optimization techniques are shown to be capable of outperforming ad hoc index construction and repetitive joint evaluations that are already supported by an index. ESA

REINVENTING INFORMATION SERVICES TO INCREASE CUSTOMER SATISFACTION

J. E. Madison 1993 6 p Presented at the INFOTECH 1993, Oak Ridge, TN, 20-23 Oct. 1993
(Contract DE-AC06-76RL-01830)
(DE94-003718; PNL-SA-22938; CONF-9310145-4) Avail: CASI HC A02/MF A01

In this paper, the author presents her view of the role of an information service and proposes means of improving information customer service and satisfaction. The emphasis of the paper is on placing the primary value on the information customer rather than on the information itself. After receiving a request for information, the information service should strive for speed and accuracy of service to provide full-text sources in a language and format convenient to the customer. The author stresses that information professionals need to re-evaluate their roles to correctly assess and rectify customers' information deficiencies. DOE

CORRESPONDENCE DICTIONARY FROM FREE ENGLISH TERM TO INIS DESCRIPTORS

Mar. 1993 18 p In ENGLISH and JAPANESE
(DE94-701173; INIS-JP-012) Avail: CASI HC A03/MF A01

This dictionary is intended for the on-line users of INIS database who select controlled terms (INIS descriptors) starting from free terms. The purpose of terminology control is to reduce the ambiguity of the term use among different subject fields and to improve the recall by coordinating the synonyms. The controlled terms are collected in the thesaurus, but it is not always easy to find suitable descriptors. This dictionary has been compiled by analyzing existing records, and provides the specialists' know-how of converting free terms to descriptors. Besides the compilation of this dictionary, the characteristics of the assigned descriptors were also clarified. DOE

CONCURRENT SHADOW PAGING: SNAPSHOTS, READ-ONLY TRANSACTIONS, AND ON-THE-FLY MULTI-LEVEL INCREMENTAL DUMPING

T. Yloenen, T. Kivinen, H. Suonsivu, and T. Maennistoe 1993 23 p See also PB93-179034
(PB94-133139; TKK-TKO-B104) Avail: CASI HC A03/MF A01

Shadow paging has a number of desirable properties, of which snapshots are discussed in this paper. It is possible to take a transaction consistent snapshot of a database in a few microseconds. This can be used to execute arbitrary read-only transactions with full consistency without any locking and only minimal overhead. A related application is dumping the database; it is shown that the page table allows very efficient multilevel incremental dumping of the database without disturbing normal transaction processing. Algorithms are given to solve the associated problems. Modification of snapshots is also discussed; this may turn out to have some interesting applications. NTIS

EFFICIENT REBALANCING OF TREE-TYPE MAIN MEMORY

DICTIONARIES
L. Malmi 1993 32 p
(PB94-133105; TKO-B107) Avail: CASI HC A03/MF A01

Keeping all data and dictionaries in main memory is a way to implement very fast access to data. Traditional data structures for such applications include balanced trees. However, in highly dynamic applications the performance of balanced trees degrades because of the time required for rebalancing the tree after each update. An alternative solution would be to give up rebalancing during peak hours and postpone it till a more peaceful time. Currently this means that the tree has to be rebalanced using algorithms whose running time is Omega(N). A new algorithm is introduced that performs rebalancing more efficiently. It only traverses the modified branches of the tree and runs in O(Mlog(N+M)) time, where N is the number of nodes in the tree and M is the number of updates performed in the tree. The algorithm is based on using chromatic search trees and at most it requires one byte per node extra storage for the information about the performed updates and the needs for rebalancing. Its performance is compared to other rebalancing algorithms and found that it performs much better when the ratio of updates to the size of the tree is below 15%. NTIS

HOW TO MAKE GOOD USE OF INTERNATIONAL RESEARCH COLLABORATION, WITH EMPHASIS ON THE EVOLVING SITUATION IN EUROPE [BON USAGE DE LA COOPERATION INTERNATIONALE POUR LES TRAVAUX DE RECHERCHE; NOTAMMENT EVOLUTION DE LA COOPERATION EUROPEENNE DE RECHERCHE]
Dec. 1992 49 p In FRENCH; Text in French; summary in English
(PB94-119690) Avail: Issuing Activity (National Technical Information Service (NTIS))

This report summarizes the work and proposals of group sessions at the second annual seminar on how to make good use of international collaboration in research. The bulk of it is taken up by two speeches by an aeronautical civil engineer and a weapons inspector. Points covered in the working groups include factors that impede and argue in favor of international research, considerations concerning basic research, problems encountered, future directions, the motivations for forming international teams, and proposals and recommendations. The first speech discusses the desirability and barriers to international collaboration in weapons research, national and international tools, legitimate actions for the EC to take, the need for a European weapons policy including an R&D and export component, and innovating by creating a European Weapons Agency. The second speech discusses changes in the General Weapons Delegation. NTIS

The mission of the Emerging Technologies thrust area at Lawrence Livermore National Laboratory is to help individuals establish technology areas that have national and commercial impact, and are outside the scope of the existing thrust areas. We continue to encourage innovative ideas that bring quality results to existing programs. We also take as our mission the encouragement of investment in new technology areas that are important to the economic competitiveness of this nation. In fiscal year 1992, we have focused on nine projects, summarized in this report: (1) Tire, Accident, Handling, and Roadway Safety; (2) EXTRANSYT: An Expert System for Advanced Traffic Management; (3) Odin: A High-Power, Underwater, Acoustic Transmitter for Surveillance Applications; (4) Passive Seismic Reservoir Monitoring: Signal Processing Innovations; (5) Paste Extrudable Explosive Aft Charge for Multi-Stage Munitions; (6) A Continuum Model for Reinforced Concrete at High Pressures and Strain Rates: Interim Report; (7) Benchmarking of the Criticality Evaluation Code COG; (8) Fast Algorithm for Large-Scale Consensus DNA Sequence Assembly; and (9) Using Electrical Heating to Enhance the Extraction of Volatile Organic Compounds from Soil. FEASIBILITY STUDY OF A MULTIAPERTURE TELESCOPE FOR DEEP-SPACE EARTH SURVEILLANCE M.S. Thesis
Charles V. Rothermich Dec. 1993 82 p
(AD-A273903; AFIT/GSO/ENP/93D-04) Avail: CASI HC A05/MF A01

Optical systems launched into space currently have a restriction on their size due to the shuttle's payload capacity. The size of optical systems on the shuttle is limited to 3 m in diameter. Multiaperture telescopes can overcome this limitation. Each subaperture of a multiaperture telescope samples the incoming signal. The waves sampled by each subaperture are combined to form a single image. The radiometric model is developed for a geosynchronous orbiting multiaperture telescope used for Earth surveillance. Using the radiometric model, SNR calculations determine if enough signal is present to generate an image. The OTF and PSF are studied to understand the effects of increasing the multiaperture telescope's diameter. Piston and tilt errors are added to the subapertures to provide insight into how these errors can degrade images in a multiaperture telescope. A total of three circular multiaperture telescopes are examined. The results show that 1 m resolution is achieved with a multiaperture telescope consisting of 31 subapertures. Each subaperture is 2.1 m in diameter, and the telescope's overall diameter is 35 m. DTIC

ULTRAVIOLET OBSERVATIONS OF ASTRONOMICAL SOURCES Final Technical Report, 1 Jul. 1988 - 14 Feb. 1993
Joel A. Eaton 15 Mar. 1994 5 p
(Grant NAG5-1327)
(NASA-CR-195232; NAS 1.26:195232) Avail: CASI HC A01/MF A01

The final report on 'Ultraviolet Observations of Astronomical Sources,' which ran for a total of three years, roughly between 1 July 1988 and 14 Feb. 1993 is presented. During the first year, I worked at Indiana University; since October, 1989, I have been at Tennessee State University. This grant has supported my studies of archival International Ultraviolet Explorer (IUE) observations of zeta Aur binaries, cool stars that are paired with hot stars in binary systems. Such systems are important as a source of detailed knowledge about the structures of chromospheres and winds in cool giant and supergiant stars, since the hot star serves as a probe of many lines of sight through the cool supergiant star's outer atmosphere. By determining the physical conditions along many such lines of sight, a detailed two-dimensional map of the chromosphere and wind may be constructed. The grant grew out of my analysis of archival IUE observations of 31 Cyg in which I analyzed five epochs of an atmospheric eclipse that occurred in 1982. I fit the attenuation spectra of atmospheric eclipse throughout the ultraviolet (lambda(lambda)1175-1950 and lambda(lambda)2500-3100) with theoretically calculated spectra, thereby determining the physical properties of gas (mass column density of absorbers, temperature, and velocity spread) along each observed line of sight. A similar analysis for other such zeta Aur binaries was accomplished and theoretical models for the chromospheres of these stars based on my observations were constructed. Author (revised)

MODELLING ATMOSPHERIC TURBULENCE EFFECTS ON GROUND-BASED TELESCOPE SYSTEMS
L. W. Bradford (California Univ., Santa Cruz.), S. M. Flatte (California Univ., Santa Cruz.), and C. E. Max 30 Sep. 1993 7 p Presented at the North Atlantic Treaty Organization/Advanced Study Inst. (NATO/ASI) Conference on Adaptive Optics for Astronomy, Cargese, France, 29 Jun. - 9 Aug. 1993
(Contract W-7405-eng-48)
(DE94-004211; UCRL-JC-115309; CONF-9306245-2) Avail: CASI HC A02/MF A01

Questions still exist concerning the appropriate model for turbulence-induced phase fluctuations seen in ground-based telescopes. Bester et al. used a particular observable (slope of the Allan variance) with an infrared interferometer in an attempt to distinguish models. That observable was calculated for Kolmogorov and 'random walk' models with a variety of outer scales and altitude-dependent turbulence and wind velocity. It was found that clear distinction between models requires good data on the vertical distribution of wind and turbulence. Furthermore, measurements at time separations of order 60 s are necessary to distinguish the 'random walk' model from the Kolmogorov model. DOE

In view of the rapid improvement in the accuracy of rotational observations of the Earth, a more sophisticated theoretical model of rotational dynamics of the Earth is needed in order to infer new information about the Earth's deep interior from observations. Numerical calculations are presented of wobble and nutation modes of realistic Earth models. The finite element method is used for numerical implementation of a variational principle based on the subseismic approximation to the motion of the outer core. A new prograde free core nutation with a period of 538 solar days for the 1066A Earth model is obtained. It is also found that the period of the retrograde free core nutation is 450 solar days, about 10 days shorter than the period given by previous studies. For the first time, the displacement field of wobble-nutation modes is calculated and plotted out in detail. This allows a comparison with other theoretical modes. A very long base interferometry data set, covering a time interval of about nine years, is analyzed to search for the free core nutation modes predicted by the study. A retrograde free nutation with a period of about 431 days is found significant above the 95% confidence level. Incomplete correction for the retrograde annual term might account for the spectral peak identified as the free core nutation. Author (CISTI)

The March 1994 Semi-Annual report for Studies of Extra-Solar Oort Clouds and the Kuiper Disk is presented. We are conducting research designed to enhance our understanding of the evolution and detectability of comet clouds and disks. This area holds promise for also improving our understanding of outer solar system formation, the bombardment history of the planets, the transport of volatiles and organics from the outer solar system to the inner planets, and to the ultimate fate of comet clouds around the Sun and other stars. According to 'standard' theory, both the Kuiper Disk and Oort Cloud are (at least in part) natural products of the planetary accumulation stage of solar system formation. One expects such assemblages to be a common attribute of other solar systems. Therefore, searches for comet disks and clouds orbiting other stars offer a new method for inferring the presence of planetary systems. Our three-year effort consists of two major efforts: observational work to predict and search for the signatures of Oort Clouds and comet disks around other stars; and modeling studies of the formation and evolution of the Kuiper Disk (KD) and similar assemblages that may reside around other stars, including beta Pic. A new quasi least-squares (QLS) algorithm has been developed for phase recovery in the triple correlation (TC) process applied to speckle imaging in astronomy. The QLS algorithm is found to provide significant improvement in terms of image reconstruction fidelity over the popular recursive algorithm. Implementing the QLS algorithm using phasors avoids the modulo 2-pi problem inherent to linear least squares solutions. The performance of the QLS algorithm, along with a Knox-Thompson (KT) phase recovery process for comparison, was rigorously studied using second- and third-order noise models. Those models eliminate the need for speckle image simulation and the computation of second- and third-order products required by KT and TC for phase recovery. The validity of the model was confirmed using simulated speckle data. Simulations showed that for the high signal to noise ratio (SNR) case, the near-axis TC transfer function subplanes have lower phase error than the comparable KT transfer function subplanes. Computing subplanes only in the near-axis region is important if computer resources are limited. Because of the lower phase error, the TC process was found to produce better images than the KT algorithm with high-SNR input data. This previously unreported difference is analyzed in detail. (Grant NAG5-1771)
(NASA-CR-195267; NAS 1.26:195267) Avail: CASI HC A03/MF A01

Research into the optical, ultraviolet and infrared continuum emission from quasars and their host galaxies was carried out. The main results were the discovery of quasars with unusually weak infrared emission and the construction of a quantitative estimate of the dispersion in quasar continuum properties. One of the major uncertainties in the measurement of quasar continuum strength is the contribution to the continuum of the quasar host galaxy as a function of wavelength. Continuum templates were constructed for different types of host galaxy and individual estimates made of the decomposed quasar and host continua based on existing observations of the target quasars. The results are that host galaxy contamination is worse than previously suspected, and some apparent weak bump quasars are really normal quasars with strong host galaxies. However, the existence of true weak bump quasars such as PHL 909 was confirmed. The study of the link between the bump strength and other wavebands was continued by comparing with IRAS data. There is evidence that excess far infrared radiation is correlated with weaker ultraviolet bumps. This argues against an orientation effect and implies a probable link with the host galaxy environment, for instance the presence of a luminous starburst. However, the evidence still favors the idea that reddening is not important in those objects with ultraviolet weak bumps. The same work has led to the discovery of a class of infrared weak quasars. Pushing another part of the envelope of quasar continuum parameter space, the IR-weak quasars have implications for understanding the effects of reddening internal to the quasars, the reality of ultraviolet turnovers, and may allow further tests of the Phinney dust model for the IR continuum. They will also be important objects for studying the claimed IR to x-ray continuum correlation. Author (revised)

It is commonly accepted that candidates to very high energy gamma-ray sources are neutron stars (NS's), binary systems, black holes, etc. Close binary systems containing a normal hot star and a NS (or a black hole) form an important class of very high energy gamma-ray sources. Such systems are variable in any region of the electromagnetic spectrum and they enable us to study various stages of stellar evolution, accretion processes, mechanisms of particle acceleration etc. Phenomena connected with this class of very high energy gamma-ray sources are discussed, the particular emphasis has been placed on the TeV region. Most of the mass density in the Universe and in the halo of our own galaxy exists in the form of dark matter. Overall, the contribution of luminous matter (in stars) to the mass density of the Universe is less than 1%. Primordial nucleosynthesis indicates that baryons contribute between 1% and 10% of the critical density (0.01 h(exp -2) is approximately less than Omega(sub B) is approximately less than 0.02 h(exp -2); h = the Hubble constant in units of 100 kms(exp -1) Mpc(exp -1)). Other evidence indicates that the total mass density is at least 10% of critical density and is likely much greater. If the universal density is as low as 10% of the critical density, there may be but one kind of dark matter. More likely, the universal density is greater than 10%, and there are two kinds of dark matter and thus, two dark matter problems: In what form does the baryonic dark matter exist? and In what form does the nonbaryonic dark matter exist? The MACHO and EROS collaborations have presented evidence for the microlensing of stars in the LMC by 10(exp -1+/-1) solar mass dark objects in the halo of our own galaxy and may well have solved one of the dark matter puzzles by identifying the form of the baryonic dark matter. It is too early to make precise statements about the fraction of the mass density in the halo of our galaxy contributed by lensing objects (= f(sub m)), though the EROS/MACHO data suggest that f(sub m) is probably 0.1 or larger. Taking our galaxy to be typical and taking account a fraction f(sub m) of the mass in the portion of the halo that contributes most significantly to microlensing (within 20 kpc of the galactic center), I estimate that lensing objects contribute a fraction 0.008f (sub m)/h of the critical density, and clearly cannot account for the bulk of the dark matter if Omega(sub 0)is much greater than 0.1. A COSMOLOGICAL FIELD THEORY Ph.D. Thesis
Steven Paul Starkovich 1992 101 p
(ISBN-0-315-84271-7; CTN-94-61017) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

In an oscillating cosmological model, the cosmological fluid is described by a classical scalar field undergoing a series of phase transitions over the lifetime of the universe. In general, for a standard model universe and a given equation of state, it is shown that the field potential V may be derived from the solution of Riccati's equation. The resulting expression for V includes parameters whose values are determined from the boundary conditions. The scalar field Lagrangian is thus determined for the entire history of the universe. The resulting cosmological model is free of singularities and describes a universe that is very cold at minimum radius and heats up rapidly in an initial inflationary era. The temperature increase of the scalar field during inflation is a direct consequence of applying classical thermodynamics and does not depend on fine tuning of free parameters. Inflation continues until the Planck temperature is attained, when a phase transition occurs and the standard model era begins. By relating the temperature of the scalar field in the theory to the radiation temperature in the standard model universe, it is possible to establish a thermodynamic constraint on a more complete theory of matter for the early universe. It is found that the value of the Hubble parameter least sensitive to the initial equation of state is 33-44 km/sec/megaparsec. Author (CISTI)

COSMOLOGICAL PHASE TRANSITIONS
E. W. Kolb Oct. 1993 18 p Presented at the 37th Yamada Conference, Tokyo, Japan, 8-12 Jun. 1993
(Contract DE-AC02-76CH-03000)
(DE94-003001; FNAL/C-93/321-A; CONF-9306277-1) Avail: CASI HC A03/MF A01

If modern ideas about the role of spontaneous symmetry breaking in fundamental physics are correct, then the Universe should have undergone a series of phase transitions early in its history. The study of cosmological phase transitions has become an important aspect of early-Universe cosmology. In this lecture I review some very recent work on three aspects of phase transitions: the electroweak transition, texture, and axions. DOE

ZODIACAL LIGHT DATA INVESTIGATION. INTERIM RESULTS FOR THE EARTHLIMB CLUTTER EXPERIMENT
Wesley K. Cobb, Shawn V. Burdick, and Thomas L. Murdock 15 Jul. 1993 74 p
(Contract F19628-91-C-0104)
(AD-A274461; Rept-1949-01-93-TR; SR-1; PL-TR-93-2179) Avail: CASI HC A04/MF A01

Zodiacal light data from the Earth Limb Clutter experiment (ELC) have been analyzed and compared with IRAS observations in order to bring the former into a common calibration framework with COBE and IRAS. There were 9 ELC spectral bands, 2 of which were broad (12 and 26 microns), and 7 of which were narrow (5.6, 9.6, 10.6, 11.5, 12.5, 13.7, 15.2 microns). The ELC data appeared to show considerable spectral structure in the zodiacal light for 9-15 micron regime. The recalibrated ELC data are also important because they contain zodiacal plane crossings at low (190) and high (1670) solar elongations -- regions not accessible to IRAS or COBE. The antisolar crossing is particularly interesting because it is associated with nearly symmetrically placed secondary peaks at + 280 ecliptic latitude. Possible origins for these peaks are discussed. DTIC

COLLISIONLESS SHOCK STRUCTURES OF EARTH AND OTHER PLANETS Final Report, Aug. 1992 - Oct. 1993
Eugene W. Greenstadt and Stewart L. Moses Nov. 1993 65 p
(Contract NASw-4749)
(NASA-CR-195257; NAS 1.26:195257; HQROM93.WR1) Avail: CASI HC A04/MF A01

This report summarizes the closing segment of our multi-spacecraft, multi-instrument study of collisionless shock structure. In this last year of our study, we have necessarily concentrated on subjects that limited time and remaining resources could be expected to bring to reasonable stopping points, if not full conclusions. Our attention has been focused therefore on matters that were either well underway when the year began or that could be expected to yield rapidly completed reports publishable quickly in abbreviated versions. Contemporary publication delays prevent any new initiatives from reaching the literature within the year in the best of circumstances. The topics that fell into these categories were detailed plasma wave (pw) phenomenology in slow shocks in the Earth's distant geomagnetic tail, instantaneous orientations of theta(sub Bn) in quasiparallel (Q(sub parallel)) shock structure, and a comprehensive overview of the relationship between structural ULF waves in the QII shock environment and waves in the magnetosphere, i.e. geomagnetic ULF pulsations. The remainder of this report describes our freshly completed results, discusses two related investigations of pw waves in the foreshock and magnetosheath, and appends the abstracts of published papers and the texts of papers in press. INVESTIGATIONS OF THE DYNAMICAL EVOLUTION OF PROTOPLANETARY NEBULAE Annual Status Report No. 1, 1 Nov. 1992 - 31 Oct. 1993
Lee W. Hartmann Mar. 1994 7 p
(Grant NAGw-2306)
(NASA-CR-195278; NAS 1.26:195278) Avail: CASI HC A02/MF A01

The spectral energy distributions (SED's) of all the known Class I (protostellar) sources in the Taurus molecular cloud were modelled. The Tereby, Shu, & Cassen (1984, TSC) density distribution for a rotating, infalling envelope was adopted. The radiative equilibrium temperature distribution from the spherical average of the TSC density distribution was calculated. The resulting spherically-symmetric temperature distribution then provides the source function to obtain the emergent spectrum at a given inclination angle i from the formal solution of the transfer equation, using the exact density (opacity) distribution. Results showed that the SED's of the protostar candidates in Taurus can be reproduced with TSC models having infall rates close to the values predicted by the theory of isothermal cloud collapse. Flat Spectrum T Tauri Stars were studied. The mid- to far-infrared fluxes of 'flat spectrum' T Tauri stars can be explained by radiative equilibrium emission from infalling dusty envelopes. This explanation indicated that models employing 'active' disks, in which the temperature distribution is a parameterized power law, should be invoked with caution. Infall also naturally explains the scattered light nebulae detected around many flat-spectrum sources. Results showed that the SED's of the protostar candidates in Taurus can be reproduced with TSC models having infall rates close to the values predicted by the theory of isothermal cloud collapse. Flattened infalling envelope models are also being studied. Derived from text

VISUALIZATION TECHNIQUES TO AID IN THE ANALYSIS OF MULTISPECTRAL ASTROPHYSICAL DATA SETS Final Report
E. W. Brugel, Gitta O. Domik, and T. R. Ayres Sep. 1993 51 p
(Grant NAGw-1902)
(NASA-CR-195268; NAS 1.26:195268) Avail: CASI HC A04/MF A01

The goal of this project was to support the scientific analysis of multi-spectral astrophysical data by means of scientific visualization. Scientific visualization offers its greatest value if it is not used as a method separate or alternative to other data analysis methods but rather in addition to these methods. Together with quantitative analysis of data, such as offered by statistical analysis, image or signal processing, visualization attempts to explore all information inherent in astrophysical data in the most effective way. Data visualization is one aspect of data analysis. Our taxonomy as developed in Section 2 includes identification and access to existing information, preprocessing and quantitative analysis of data, visual representation and the user interface as major components to the software environment of astrophysical data analysis. In pursuing our goal to provide methods and tools for scientific visualization of multi-spectral astrophysical data, we therefore looked at scientific data analysis as one whole process, adding visualization tools to an already existing environment and integrating the various components that define a scientific data analysis environment. As long as the software development process of each component is separate from all other components, users of data analysis software are constantly interrupted in their scientific work in order to convert from one data format to another, or to move from one storage medium to another, or to switch from one user interface to another. We also took an in-depth look at scientific visualization and its underlying concepts, current visualization systems, their contributions and their shortcomings. The role of data visualization is to stimulate mental processes different from quantitative data analysis, such as the perception of spatial relationships or the discovery of patterns or anomalies while browsing through large data sets. Visualization often leads to an intuitive understanding of the meaning of data values and their relationships by sacrificing accuracy in interpreting the data values. In order to be accurate in the interpretation, data values need to be measured, computed on, and compared to theoretical or empirical models (quantitative analysis). If visualization software hampers quantitative analysis (which happens with some commercial visualization products), its use is greatly diminished for astrophysical data analysis. The software system STAR (Scientific Toolkit for Astrophysical Research) was developed as a prototype during the course of the project to better understand the pragmatic concerns raised in the project. STAR led to a better understanding on the importance of collaboration between astrophysicists and computer scientists. Twenty-one examples of the use of visualization for astrophysical data are included with this report. Sixteen publications related to efforts performed during or initiated through work on this project are listed at the end of this report. Author

THE KINETICS AND DYNAMICS OF THE COMA OF HALLEY'S COMET Final Report
Michael R. Combi Jan. 1994 64 p
(Grants NAGw-1946; NAGw-695; NAGw-3319)
(NASA-CR-194828; NAS 1.26:194828) Avail: CASI HC A04/MF A01

This grant to the University of Michigan supported the efforts of Michael R. Combi to serve as a co-investigator in collaboration with a larger effort by the principal investigator, William Smyth of Atmospheric and Environmental Research, Inc. The overall objective of this project was to analyze in a self-consistent manner unique optical O((sup 1)D) and NH2 ultra-high resolution line profile data of excellent quality and other supporting lower-resolution spectral data for the coma of comet P/Halley by using highly developed and physically-based cometary coma models in order to determine and explain in terms of physical processes the actual dynamics and photochemical kinetics that occur in the coma. The justification for this work is that it provides a valuable and underlying physical base from which to interpret significantly different types of coma observations in a self-consistent manner and hence bring into agreement (or avoid) apparent inconsistencies that arise from non-physically based interpretations. The level of effort for the Michigan component amounted to less than three person-months over a planned period of three years. The period had been extended at no extra cost to four years because the Michigan grant and the AER contract did not have coincident time periods. An effort of somewhat larger scope was undertaken by the PI. The importance of the O((sup 1)D) profiles is that they provide a direct trace of the water distribution in comets. The line profile shape is produced by the convolution of the outflow velocity and thermal dispersion of the parent water molecules with the photokinetic ejection of the oxygen atoms upon photodissociation of the parent water molecules. Our understanding of the NH2 and its precursor ammonia are important for comet-to-comet composition variations as they relate to the cosmo-chemistry of the early solar nebula. Modeling of the distribution of NH2 is necessary in order to infer the ammonia production rates from NH2 observations. Derived from text

AN EVALUATION OF THE UTILITY OF GROUND-BASED HIGH RESOLUTION INTERFEROMETER (GB-HIS) SOUNDINGS OF THE PLANETARY BOUNDARY LAYER Ph.D. Thesis
Han-Jun Ding 1993 84 p
(Contract DE-FG02-92ER-61365)
(DE94-000960; DOE/ER-61365/T2) Avail: CASI HC A05/MF A01

Atmospheric soundings generated from the ground-based high resolution interferometer sounder (GB-HIS) are evaluated. The two goals are (1) to estimate the accuracy of GB-HIS temperature and dew point soundings using statistical analysis and comparison against observation from simultaneous radiosondes, and (2) to exploit the high temporal resolution of GB-HIS data set to analyze planetary boundary layer (PBL) thermodynamic properties. Five additional sections are included. Section 2 describes the methodology of GB-HIS retrieval. Section 3 provides a statistical error analysis of the GB-HIS system. Section 4 shows the utility of GB-HIS data in monitoring the PBL evolution, while Section 5 discusses and validates a simple mixed-layer growth model. Finally, Section 6 offers conclusions and suggestions for further studies. DOE

SULFUR DIOXIDE IN THE ATMOSPHERE OF VENUS 1 SOUNDING ROCKET OBSERVATIONS Final Technical Report, 1 Feb. 1976 - 31 Mar. 1994
William E. McClintock, Charles A. Barth, and Richard A. Kohnert 1994 53 p
(Grant NsG-5103)
(NASA-CR-195224; NAS 1.26:195224) Avail: CASI HC A04/MF A01

In this paper we present ultraviolet reflectance spectra obtained during two sounding rocket observations of Venus made during September 1988 and March 1991. We describe the sensitivity of the derived reflectance to instrument calibration and show that significant artifacts can appear in that spectrum as a result of using separate instruments to observe both the planetary radiance and the solar irradiance. We show that sulfur dioxide is the primary spectral absorber in the 190 - 230 nm region and that the range of altitudes probed by these wavelengths is very sensitive to incidence and emission angles. In a following paper Na et. al. (1994) show that sulfur monoxide features are also present in these data. Accurate identification and measurement of additional species require observations in which both the planetary radiance and the solar irradiance are measured with the same instrument. The instrument used for these observations is uniquely suited for obtaining large phase angle coverage and for studying transient atmospheric events on Venus because it can observe targets within 18 deg of the sun while earth orbiting instruments are restricted to solar elongation angles greater than or equal to 45 deg. STUDIES FOR IO'S EXTENDED ATMOSPHERE AND NEUTRAL CLOUDS AND THEIR IMPACT ON THE LOCAL SATELLITE ATMOSPHERE AND ON THE PLANETARY MAGNETOSPHERE Final Report, 10 Dec. 1992 - 9 Dec. 1993
William H. Smyth 9 Dec. 1993 127 p
(Contract NASw-4771)
(NASA-CR-195255; NAS 1.26:195255) Avail: CASI HC A07/MF A02

The research performed in this project is divided in two main investigations: (1) the synthesis and analysis of a collection of independent observations for Io's sodium corona, its sodium extended atmosphere, and the sodium cloud, and (2) the analysis of a (System III longitude correlated) space-time 'bite-out' near western elongation in the 1981 sodium cloud images from the JPL Table Mountain Sodium Cloud Data Set. For the first investigation, modeling analysis of the collective observed spatial profiles has shown that they are reproduced by adopting at Io's exobase a modified sputtering flux speed distribution function which is peaked near 0.5 km/s and has a small high-speed (15-20 km/s) nonisotropic component. The nonisotropic high-speed component is consistent with earlier modeling of the trailing directional feature. For the second investigation, modeling analysis of the 'bite-out' observed near western elongation (but not eastern elongation) has shown that it is reproduced in model calculation by adopting a plasma torus description for the sodium lifetime that is inherently asymmetric in System III longitudes of the active sector and that also has an east-west asymmetry. The east-west and System III longitude asymmetries were determined from independent observations for the plasma torus in 1981. The presence of the 'bite-out' feature only near western elongation may be understood in terms of the relative value for sodium of its lifetime and its transport time through the System III enhanced plasma torus region. PLANETARY INSTRUMENT DEFINITION AND DEVELOPMENT PROGRAM (PIDDP). INSTRUMENT FOR FUTURE PLANETARY FLIGHT MISSIONS: A VISIBLE-INFRARED IMAGING SPECTROMETER FOR PLANETARY MISSIONS Final Report
Thomas B. McCord 12 Oct. 1993 13 p
(Contract NASw-4739)
(NASA-CR-195254; NAS 1.26:195254) Avail: CASI HC A03/MF A01

The objective of this project is to develop and prove a small, light-weight, efficient imaging spectrometer design to cover the VIS/NIR spectral range for applications particularly but not exclusively to NASA inner solar system space missions. A design and a brassboard prototype will be developed and tested. Progress over the first year of this project includes design specification, optical design layout, grating specifications, infrared detector selection, and mechanical design. Mechanical and grating manufacturing drawings were begun. We developed an agreement in principle to cooperate with the German space group, DLR, to apply some of their electronics microminiaturization technology to this imaging spectrometer project, mostly or entirely at their expense. Funds from NASA for the second year of this effort have been received and the effort is on track. Release of funds for the third year of this award will be requested later this year in order to accelerate this work and bring it to a conclusion in time for new NASA missions considerations as well as to make effective use of the DLR contributions. EXPERIMENTAL STUDY OF LUNAR AND SNC (MARS) MAGMAS Progress Report, 1 Apr. 1992 - 31 Mar. 1994
Malcolm J. Rutherford 1994 4 p
(Grant NAG9-575)
(NASA-CR-195274; NAS 1.26:195274) Avail: CASI HC A01/MF A01

The overall objectives of this research were to evaluate the role of C-O-S-Cl degassing processes in explaining vesiculation, oxidation state and fire-fountaining of lunar magmas by analysis of individual lunar glass spherules, and by experimental determination of equilibrium abundances and diffusion rates of C, S and Cl melt species in lunar glass compositions; and to determine possible primitive SNC magma compositions and the mineralogy of the mantle from which they were derived, and to evaluate P, T, XH2O etc. conditions at which they crystallize to form the SNC meteorites. After funding for one year, a project on the A15 volcanic green glass has been completed to the point of writing a first manuscript. Carbon-oxygen species C-O and CO2 are below detection limits (20 ppm) in these glasses, but there is up to 500 ppm S with concentrations both increasing and decreasing toward the spherule margins. Calculations and modeling indicate that C species could have been present in the volcanic gases, however. In a second project, experiments with low PH2O have resulted in refined estimates of the early intercumulus melt composition in the Chassigny meteorite which is generally accepted as a sample from Mars. REANALYSIS OF MARINER 9 UV SPECTROMETER DATA FOR OZONE, CLOUD, AND DUST ABUNDANCES, AND THEIR INTERACTION OVER CLIMATE TIMESCALES Final Report, 1 May 1991 - 31 Dec. 1993
Bernhard Lee Lindner 7 Feb. 1994 138 p
(Contract NASw-4614)
(NASA-CR-195244; NAS 1.26:195244) Avail: CASI HC A07/MF A02

Mariner 9 UV spectrometer data have been reinverted for the ozone abundance. The spectra were fit by models which covered the full range in observed solar zenith angle, cloud, dust and ozone amount, ice albedo and look angles. Errors in ozone retrieval with this data are tabulated over a range in theses conditions and are shown graphically. This work shows that significant underestimation of ozone occurred in earlier analysis of Mariner 9 data, and that much of the observed variability in Mars ozone is due to masking of ozone by clouds and dust. An in-situ measurement by balloon is recommended as it is the only technique capable of accurately inferring the ozone abundance in all conditions. Recommendations for future research are also presented. 7 manuscripts have been published in refereed journals, and three are in review. A review of these publications and presentations is in the report. For individual titles, see N94-27886 through N94-27892.

COOLING THE MARTIAN ATMOSPHERE: THE SPECTRAL OVERLAP OF THE C02 15 MICROMETERS BAND AND DUST
Bernhard Lee Lindner *In its* Reanalysis of Mariner 9 UV Spectrometer Data for Ozone, Cloud, and Dust Abundances, and Their Interaction Over Climate Timescales 7 Feb. 1994 4 p (For primary document see N94-27885 07-91)
(Contract NASw-4614; NAGw-389; NAGw-552; NSF ATM-83-05841)
Avail: CASI HC A01/MF A02

Careful consideration must be given to the simultaneous treatment of the radiative transfer of the CO2 15 micron band and dust calculations for the Martian winter polar region show that a simple sum of separately calculated CO2 cooling rates and dust cooling rates can easily result a 30 percent error in the net cooling particularly near the surface. CO2 and dust hinder each others ability to cool the atmosphere. Even during periods of low dust opacity, dust still reduces the efficacy of CO2 at cooling the atmosphere. At the other extreme, when dust storms occur, CO2 still significantly impedes the ability of dust to cool the atmosphere. Hence, both CO2 and dust must be considered in radiative transfer models. MARTIAN ATMOSPHERIC RADIATION BUDGET
Bernhard Lee Lindner *In its* Reanalysis of Mariner 9 UV Spectrometer Data for Ozone, Cloud, and Dust Abundances, and Their Interaction Over Climate Timescales 7 Feb. 1994 32 p Revised Submitted for publication (For primary document see N94-27885 07-91)
(Contract NASw-4614; NAGw-389; NAGw-552; NSF ATM-83-05841)
Avail: CASI HC A03/MF A02

A computer model is used to study the radiative transfer of the martian winter-polar atmosphere. Solar heating at winter-polar latitudes is provided predominately by dust. For normal, low-dust conditions, CO2 provides almost as much heating as dust. Most heating by CO2 in the winter polar atmosphere is provided by the 2.7 micron band between 10 km and 30 km altitude, and by the 2.0 micron band below 10 km. The weak 1.3 micron band provides some significant heating near the surface. The minor CO2 bands at 1.4, 1.6, 4.8 and 5.2 micron are all optically thin, and produce negligible heating. O3 provides less than 10 percent of the total heating. Atmospheric cooling is predominantly thermal emission by dust, although CO2 15 micron band emission is important above 20 km altitude. MARS OZONE: MARINER 9 REVISITED
Bernhard Lee Lindner *In its* Reanalysis of Mariner 9 UV Spectrometer Data for Ozone, Cloud, and Dust Abundances, and Their Interaction Over Climate Timescales 7 Feb. 1994 15 p Submitted for publication (For primary document see N94-27885 07-91)
(Contract NASw-4614)
Avail: CASI HC A03/MF A02

The efficacy of the UV spectroscopy technique used by Mariner 9 to remotely measure ozone abundance at Mars is discussed. Previously-inferred ozone abundances could be underestimated by as much as a factor of 3, and much of the observed variability in the ozone abundance could be due to temporal and spatial variability in cloud and dust amount. WHY IS THE NORTH POLAR CAP ON MARS DIFFERENT THAN THE SOUTH POLAR CAP?
Bernhard Lee Lindner *In its* Reanalysis of Mariner 9 UV Spectrometer Data for Ozone, Cloud, and Dust Abundances, and Their Interaction Over Climate Timescales 7 Feb. 1994 2 p (For primary document see N94-27885 07-91)
Avail: CASI HC A01/MF A02

One of the most puzzling mysteries about the planet Mars is the hemispherical asymmetry in the polar caps. Every spring the seasonal polar cap of CO2 recedes until the end of summer, when only a small part, the residual polar cap, remains. During the year that Viking observed Mars, the residual polar cap was composed of water ice in the northern hemisphere but was primarily carbon dioxide ice in the southern hemisphere. Scientists have sought to explain this asymmetry by modeling observations of the latitudinal recession of the polar cap and seasonal variations in atmospheric pressure (since the seasonal polar caps are primarily frozen atmosphere, they are directly related to changes in atmospheric mass). These models reproduce most aspects of the observed annual variation in atmospheric pressure fairly accurately. Furthermore, the predicted latitudinal recession of the northern polar cap in the spring agrees well with observations, including the fact that the CO2 ice is predicted to completely sublime away. However, these models all predict that the carbon dioxide ice will also sublime away during the summer in the southern hemisphere, unlike what is observed. This paper will show how the radiative effects of ozone, clouds, airborne dust, light penetration into and through the polar cap, and the dependence of albedo on solar zenith angle affect CO2 ice formation and sublimation, and how they help explain the hemispherical asymmetry in the residual polar caps. These effects have not been studied with prior polar cap models. Derived from text

PROBING THE MARTIAN ATMOSPHERE IN THE ULTRAVIOLET

Bernhard Lee Lindner *In its* Reanalysis of Mariner 9 UV Spectrometer Data for Ozone, Cloud, and Dust Abundances, and Their Interaction Over Climate Timescales 7 Feb. 1994 4 p (For primary document see N94-27885 07-91)
Avail: CASI HC A01/MF A02

Ozone is a key to understanding atmospheric chemistry on Mars. The O3 abundance has been inferred from UV spectra by several spacecraft, with the most complete coverage provided by Mariner 9. The Mariner 9 UV spectrometer scanned from 2100 to 3500 Angstroms in one of its two spectral channels every 3 seconds with a spectral resolution of 15 Angstroms and an effective field-of-view of approximately 300 sq km. The only atmospheric absorption in the 2000 to 3000 Angstrom region was assumed to come from the Hardey band system of ozone, which has an opacity of order unity. Therefore, the amount of ozone was inferred by fitting this absorption feature with laboratory data of ozone absorption, as shown in Fig 1. Mars O3 shows strong seasonal and latitudinal variation, with column abundances ranging from 0.2 micron-atm at equatorial latitudes to 60 micron-atm over the northern winter polar latitudes (1 micron-atm is a column abundance of 2.689 x 10(exp 15) molecules cm(exp -2). However, the O3 abundance is never great enough to significantly affect atmospheric temperatures or surface temperatures and frost budgets. Author (revised)

HOW WELL WAS TOTAL OZONE ABUNDANCE INFERRED WITH MARINER 9?

Bernhard Lee Lindner *In its* Reanalysis of Mariner 9 UV Spectrometer Data for Ozone, Cloud, and Dust Abundances, and Their Interaction Over Climate Timescales 7 Feb. 1994 7 p (For primary document see N94-27885 07-91)
Avail: CASI HC A02/MF A02

Ozone is a key to understanding atmospheric chemistry on Mars. Over 20 photochemical models of the martian atmosphere have been published, and O3 is often used as a benchmark for these models. O3 abundance has been inferred from instrumentation on several spacecraft, with the most complete coverage provided by Mariner 9. The Mariner 9 UV spectrometer scanned from 2100 to 3500 Angstroms with a spectral resolution of 15 Angstroms and an effective field-of-view of approximately 300 sq km. The only atmospheric absorption in the 2000 to 3000 A wavelength region was previously assumed to come from the Hartley band system of ozone, which has an opacity of order unity at winter polar latitudes. Therefore, the amount of ozone was inferred by fitting this absorption feature with laboratory data of ozone absorption. Mars O3 shows strong seasonal and latitudinal variation, with column abundances ranging from 0.2 micron-atm at equatorial latitudes to 60 micron-atm over northern winter polar latitudes (1 micron-atm is a column abundance of 2.689 x 10 exp 15 molecules cm(exp -2)). However, the O3 abundance is never great enough to significantly affect atmospheric temperatures or surface temperatures and frost amounts. Some of the previously-inferred O3 abundances are shown. A radiative transfer computer model is used to re-examine the Mariner 9 UV spectra. Assuming a constant mixing ratio for O3 and no chemical or radiative interaction between O3 and clouds/dust, it is shown that when typical amounts of dust and cloud are present that significant underestimation of O3 abundance occurs. A factor of 3 times as much O3 is needed to generate the same spectrum the spacecraft would measure for a cloudy, dusty atmosphere as for a clear atmosphere. If the scattering properties of martian clouds and dust were well known, then their appearance would not be a problem, as a model would be capable of retrieving the O3 abundance. However, these properties are not well known, which raises doubts about the effectiveness of the UV reflectance spectroscopy technique for measuring O3 abundance on Mars. Derived from text

IN SITU MARS OZONE DETECTOR

Bernhard Lee Lindner and Elliot M. Weinstock (Harvard Univ., Cambridge, MA.) *In its* Reanalysis of Mariner 9 UV Spectrometer Data for Ozone, Cloud, and Dust Abundances, and Their Interaction Over Climate Timescales 7 Feb. 1994 1 p (For primary document see N94-27885 07-91)
Avail: CASI HC A01/MF A02

We propose sending a balloon-borne UV photometer sensor package to measure atmospheric ozone on Mars, and this package could be a Discovery Program sensor candidate. Past measurements of ozone on Mars are highly uncertain, perhaps a factor of 3 or so uncertain, due primarily to interference and masking by cloud and dust. In-situ balloon measurements would avoid these problems, and would provide 'ground truth' which remote sensing techniques cannot. We have explored this approach to measure ozone abundance in the terrestrial stratosphere with a balloon-borne UV absorption photometer. Atmospheric pressures and temperatures and ozone concentrations near the surface of Mars are similar to those in the terrestrial stratosphere. Derived from text

THE MARTIAN ATMOSPHERIC PLANETARY BOUNDARY LAYER STABILITY, FLUXES, SPECTRA, AND SIMILARITY Final Report

James E. Tillman 23 Mar. 1994 1 p
(Grant NAGw-2041)
(NASA-CR-195711; NAS 1.26:195711) Avail: CASI HC A01/MF A01

This is the first analysis of the high frequency data from the Viking lander and spectra of wind, in the Martian atmospheric surface layer, along with the diurnal variation of the height of the mixed surface layer, are calculated for the first time for Mars. Heat and momentum fluxes, stability, and z(sub O) are estimated for early spring, from a surface temperature model and from Viking Lander 2 temperatures and winds at 44 deg N, using Monin-Obukhov similarity theory. The afternoon maximum height of the mixed layer for these seasons and conditions is estimated to lie between 3.6 and 9.2 km. Estimations of this height is of primary importance to all models of the boundary layer and Martian General Circulation Models (GCM's). Model spectra for two measuring heights and three surface roughnesses are calculated using the depth of the mixed layer, and the surface layer parameters and flow distortion by the lander is also taken into account. These experiments indicate that z(sub O), probably lies between 1.0 and 3.0 cm, and most likely is closer to 1.0 cm. The spectra are adjusted to simulate aliasing and high frequency rolloff, the latter caused both by the sensor response and the large Kolmogorov length on Mars. Since the spectral models depend on the surface parameters, including the estimated surface temperature, their agreement with the calculated spectra indicates that the surface layer estimates are self consistent. This agreement is especially noteworthy in that the inertial subrange is virtually absent in the Martian atmosphere at this height, due to the large Kolmogorov length scale. These analyses extend the range of applicability of terrestrial results and demonstrate that it is possible to estimate the effects of severe aliasing of wind measurements, to produce a models which agree well with the measured spectra. The results show that similarity theory developed for Earth applies to Mars, and that the spectral models are universal. Author (revised)

STUDIES FOR THE LOSS OF ATOMIC AND MOLECULAR SPECIES FROM IO Annual Report, 1 May 1993 - 30 Apr. 1994

Michael R. Combi 7 Apr. 1994 72 p
(Grant NAGw-3585)
(NASA-CR-195702; NAS 1.26:195702) Avail: CASI HC A04/MF A01

The general objective of this project is to advance theoretical understanding of Io's atmosphere and how various atomic and molecular species are lost from this atmosphere and are distributed in the circumplanetary environment of Jupiter. The major task for the University of Michigan portion of this work is the generalization of the Io sodium cloud model to simulate the ion-precursor of sodium that is the apparent source of the fast sodium jet observed by Schneider et al. (1991). The goal is a quantitative test of the molecular ion hypothesis with a model that is comparable to a general sodium cloud model published previously. A detailed comparison of observations with such a model will help to probe the feasibility of such a source and to examine the rates and scale lengths associated with the decay of the ion precursor so as to possibly uncover the identity of the parent ion. Another important task to be performed at Michigan is more support of AER in the general area of modeling the Na and SO2-family clouds. Derived from text

LUNAR TRANSPORTATION FACILITIES AND OPERATIONS STUDY, OPTION 1 Annual Report
May 1991 444 p Original contains color illustrations
(Contract NAS10-11567)
(NASA-CR-195700; NAS 1.26:195700) Avail: CASI HC A19/MF A04; 1 functional color page

Throughout the Option I period of the Lunar Transportation Facilities and Operations Study (LTFOS), McDonnell Douglas Space Systems Company - Kennedy Space Center (MDSSC-KSC) provided support to both the Planetary Surface Systems (PSS) Office at the National Aeronautics and Space Administration (NASA) at the Johnson Space Center and to the Flight and Ground Systems Projects Office (Payload Projects Management) at the Kennedy Space Center. The primary objective of the Option I phase of the study was to assist the above NASA centers in developing Space Exploration Initiative (SEI) concepts. MDSSC-KSC conducted three analyses which provided launch and landing detail to the proposed exploration concepts. One analysis, the Lunar Ejecta Assessment, was conducted to determine the effects of launch and landing a vehicle in a dusty environment. A second analysis, the Thermal/Micrometeoroid Protection Trade Study, was refined to determine the impacts that Reference Architecture Option 5A would have on thermal/micrometeoroid protection approaches. The third analysis, the Centaur Prelaunch Procedure Analysis, used a Centaur prelaunch test and checkout flow to identify key considerations that would be important if a Lunar Excursion Vehicle (LEV) was to use an expander cycle liquid oxygen-liquid hydrogen engine. Several 'quick look' assessments were also conducted. One quick look assessment, the Storable Propellant Quick Look Assessment, was conducted to identify design considerations that should be made if storable propellants were to be used instead of liquid oxygen and liquid hydrogen. The LEV Servicer Maintenance Analysis provided an early look at the effort required to maintain an LEV Servicer on the lunar surface. Also, support was provided to the PSS Logistics Manager to develop initial LEV Servicer cost inputs. Consideration was given to the advanced development that must be provided to accomplish a lunar and/or Mars mission. MDSS-KSC also provided support to both MASE and PSS by reviewing and commenting on architecture documents and concept definitions to ensure adequate considerations were given to the launch and landing function of an exploration initiative. (Contract NAS10-11567)
(NASA-CR-195701; NAS 1.26:195701) Avail: CASI HC A12/MF A03; 1 functional color page

During the Option 2 period of the Lunar Transportation Facilities and Operations Study (LTFOS), a joint McDonnell Douglas Space Systems Company Kennedy Space Center (MDSSC-KSC) and National Aeronautics and Space Administration Kennedy Space Center (NASA-KSC) Study team conducted a comparison of the functional testing of the RL-10 and Space Shuttle Main Engine, a quick-look impact assessment of the Synthesis Group Report, and a detailed assessment of the Synthesis Group Report. The results of these KSC LTFOS team efforts are included. The most recent study task effort was a detailed assessment of the Synthesis Group Report. The assessment was conducted to determine the impact on planetary launch and landing facilities and operations. The result of that effort is a report entitled 'Analysis of the Synthesis Group Report, its Architectures and their Impacts on PSS Launch and Landing Operations' and is contained in Appendix A. The report is structured in a briefing format with facing pages as opposed to a narrative style. A quick-look assessment of the Synthesis Group Report was conducted to determine the impact of implementing the recommendations of the Synthesis Group on KSC launch facilities and operations. The data was documented in a presentation format as requested by Kennedy Space Center Technology and Advanced Projects Office and is included in Appendix B. Appendix C is a white paper on the comparison of the functional testing of the RL-10 and Space Shuttle Main Engine. The comparison was undertaken to provide insight regarding common test requirements that would be applicable to Lunar and Mars Excursion Vehicles (LEV and MEV). Author (revised)

This contract is for a two-year research study of the origins of activity in the upper atmosphere of the sun. The approach is to collect high resolution images of the lower atmosphere on observing runs at the Swedish Solar Observatory on La Palma, Canary Islands, Spain. The best observations are analyzed and compared with data from other telescopes and/or theoretical models, to study magnetic flux emergence, coronal heating, and various dynamic phenomena and transients. Software for analysis and visualization of the data is developed as needed. The contract is being performed by the Solar and Astrophysics Laboratory, part of the Lockheed Palo Alto Research Laboratory (LPARL) of the Research and Development Division (RDD) of Lockheed Missiles and Space Co., Inc. (LMSC).

It has been recently proposed that the coronae of single late-type main sequence stars represent the radiative output from a large number of tiny energy release events, the so-called nanoflares. Although this suggestion is attractive and order of magnitude estimates of the physical parameters involved in the process are consistent with available data, nanoflares have not yet been observed and theoretical descriptions of these phenomena are still very crude. The temporal behavior of a magnetic flux tube subject to the repeated occurrence of energy release events, randomly distributed in time are examined, and it was shown that an originally empty cool loop may, in fact, reach typical coronal density and temperature values via nanoflare heating. By choosing physical parameters appropriate to solar conditions, the possibilities for observationally detecting nanoflares were also examined. Although the Sun is the only star where nanoflares might be observed, present instrumentation appears to be inadequate for this purpose. DOE

Large solar events and geomagnetic disturbances can affect satellites and people in space as well as earth-based systems. The activity of solar region 5395 is an example of how events on the sun can interfere with systems we all depend on. The report outlines the potential effects of large and active sunspot regions and provides examples of how this particular region affected many human-made systems. A summary plot is provided of the x-ray, energetic particle, and geomagnetic activity for the period 6 March - 19 March 1989, most of which was produced by region 5395.

(Contract F49620-92-J-0061)
(AD-A274315; AFOSR-93-0909TR) Avail: CASI HC A03/MF A01

A dynamical model of the solar activity cycle has been developed that incorporates the key chaotic mechanism of on/off intermittence. It has been proposed that the solar butterfly diagram represents the motion of activity waves which are very stable nonlinear solitary waves. The waves are driven by an instability under the convection zone in a layer called the tachocline. The result are for one wave in one solar hemisphere but show the correct spatio-temporal dynamics. A new approach to dynamo theory is being developed based on theoretical techniques developed in chaos theory called the thermodynamic formalism. Possible sources of activity in other turbulent, rotating stars has been studied. DTIC

During the past year, the Stanford group has continued its investigations into the origins of solar coronal activity. Solar activity occurs within a complex magnetic environment, which is determined by the entire history of magnetic flux emergence and surface flows at the underlying photosphere. One of the main achievements has been the development of a technique to reconstruct the coronal magnetic field above active regions from measurements of the magnetic field at the photosphere. To complement this empirical tool, the authors have continued theoretical work on the influence of photospheric shearing motions on the configuration and energy content of coronal fields. This work is shedding light on the nature of eruptive phenomena such as coronal mass ejections. They have also intensively evaluated the role of magnetohydrodynamic waves and reconnection in heating the solar atmosphere, and identified a number of promising coronal heating scenarios that will require detailed numerical modeling. HIGH RESOLUTION STUDIES OF SUNSPOTS AND FLUX TUBES Progress Report, 1 Nov. 1993 - 1 Feb. 1994
Alan Title 1994 7 p
(Contract NAS8-39747)
(NASA-CR-195216; NAS 1.26:195216) Avail: CASI HC A02/MF A01

This contract is for a three-year research study of sunspots and magnetic flux tubes in the solar atmosphere, using tunable filter images collected with a CCD camera during observing runs at the Canary Islands observatories in Spain. The best observations are analyzed and compared with theoretical models, to study the structure and dynamics of sunspots, their connections with surrounding magnetic fields, and the properties and evolution of smaller flux tubes in plage and quiet sun. Scientific results are reported at conferences and published in the appropriate journals. The contract is being performed by the Solar and Astrophysics Laboratory, part of the Lockheed Palo Alto Research Laboratory (LPARL) of the Research and Development Division (RDD) of Lockheed Missiles and Space Co., Inc. (LMSC). The principal investigator is Dr. Alan Title, and the research is done by him and other scientific staff at LPARL and Solar Physics Research Corporation (SPRC), often in collaboration with visiting scientists and students from other institutions. Highlights during this reporting period include completing the final version of a paper on the Evershed effect, writing a paper on magnetic diffusion, continuing work on contrast of small flux tubes, and work on the development of new models to interpret our sunspots observations. THE STATUS OF THE SOLAR NEUTRINO PROBLEM
Thomas J. Bowles 1993 17 p Presented at the 16th Meeting on Elementary Particle Physics, Kazimierz, Poland, 24-28 May 1993
(Contract W-7405-eng-36)
(DE94-003934; LA-UR-93-4173; CONF-9305309-1) Avail: CASI HC A03/MF A01

Perhaps the most outstanding discrepancy between prediction and measurements in current particle physics comes from the solar neutrino problem, in which a large deficit of high-energy solar neutrinos is observed. Many Nonstandard Solar Models have been invoked to try to reduce the predicted flux, but all have run into problems in trying to reproduce other measured parameters (e.g., the luminosity) of the Sun. Other explanations involving new physics such as neutrino decay and neutrino oscillations, etc. have also been proffered. Again, most of these explanations have been ruled out by either laboratory or astrophysical measurements. It appears that perhaps the most likely particle physics solution is that of matter enhanced neutrino oscillation, the Mikheyev - Smirnov - Wolfenstein (MSW) oscillations. Two new radiochemical gallium experiments, which have a low enough threshold to be sensitive to the dominant flux of low-energy p-p neutrinos, now also report a deficit and also favor a particle physics solution. The next generation of solar experiments promise to finally resolve the source of the 'solar neutrino problem' by the end of this decade. DOE

One of the outstanding problems in solar flare theory is how to explain the 10-20 keV and greater hard x-ray emissions by a thick target bremsstrahlung model. The model requires the acceleration mechanism to accelerate approximately 10(exp 35) electrons sec(exp -l) with comparable energies, without producing a large return current which persists for long time scales after the beam ceases to exist due to Lenz's law, thereby, producing a self-magnetic field of order a few mega-Gauss. In this paper, we investigate particle acceleration resulting from the relaxation of unstable ion ring distributions, producing strong wave activity at the lower hybrid frequency. It is shown that strong lower hybrid wave turbulence collapses in configuration space producing density cavities containing intense electrostatic lower hybrid wave activity. The collapse of these intense nonlinear wave packets saturate by particle acceleration producing energetic electron and ion tails. There are several mechanisms whereby unstable ion distributions could be formed in the solar atmosphere, including reflection at perpendicular shocks, tearing modes, and loss cone depletion. Numerical simulations of ion ring relaxation processes, obtained using a 2 1/2-D fully electromagnetic, relativistic particle in cell code are discussed. We apply the results to the problem of explaining energetic particle production in solar flares. The results show the simultaneous acceleration of both electrons and ions to very high energies: electrons are accelerated to energies in the range 10-500 keV, while ions are accelerated to energies of the order of MeVs, giving rise to x-ray emission and gamma-ray emission respectively. Our simulations also show wave generation at the electron cyclotron frequency. We suggest that these waves are the solar millisecond radio spikes. The strong turbulence collapse process leads to a highly filamented plasma producing many localized regions for particle acceleration and resulting in approximately 10(exp 17) electron 'beamlets' of width approximately equal to 10 lambda sub De which eliminates the production of large magnetic fields. In this paper, we demonstrate that the model produces an energetic electron spectrum with the right flux to account for the hard x-ray observations. Author (revised)

Avail: CASI HC A01/MF A01

A summary of the study on the global characteristics of very high energy cosmic-ray hadron interactions is presented. The study is carried out on the basis of 75 families recorded during the total of up to 1,400 sq m per year exposure at the Chacaltaya and the Pamir. The first striking encountered feature is those highest energy cosmic-ray families' wonderful variety in configurations. The second feature is the scantiness in frequency of the families at the Chacaltaya and Pamir altitudes. It will be convincing to assume that the higher energy portion of the constituent showers will reflect the characteristics of the family-generating main interaction directly. The scatter diagram of the number of hadrons against energy fraction of hadron component is shown. There are large differences between the observational and the simulational distributions which are of the same character as already noticed previously for the families with E(sub family) greater than or equal to 100 TeV. There exist families which are extremely rich in hadrons, in both multiplicity and energy fraction. They represent no other than the manifest indication that there exist exotic families with the characteristics similar to those of the 'Centauro-species'. Author (NASDA)

This report presents the experimental results on cosmic-ray families of unusually small lateral spread, indicate the production of extremely small pt particles. Families of that kind have ever been reproduced well by the simulation calculations based on the ordinary multiple pion production models. The experimental results have been obtained on statistics of the 75 cosmic-ray families of the highest energy range, i.e., those with the visible energy sums not less than 500 TeV, recorded in the Chacaltaya two-story chambers, the Pamir and Pamir-joint chambers of carbon type, with the total exposure of the analyzed part amounting to up to 1,400 m2yr. The structure of energy flow, including the degree of sharpness in energy concentration on the above 75 families, and comparison of the results with those of the simulation calculation based on the model were studied. A systematic study on such type of high energy clusters of visible energy not less than 100 TeV has been carried out in nuclear emulsion plates under microscope for the families observed in the Chacaltaya chambers. Avail: CASI HC A01/MF A01

This report presents the clean and/or quasi-clean examples which show characteristics of extremely large pt(gamma) particle production among 75 families of the highest energy range--those with visible energy sum greater than 500 TeV. It is possible to select clean and/or quasi-clean families by looking for the events which show an absent or very minor contribution of lower energy showers over the family area, since such lower energy showers near the threshold energy must come from secondary and/or tertiary effects during the passage through the atmosphere. Examples are given of such quasi-clean families with extreme large lateral spread and where the interaction must occur near the chambers. This indicates abnormal large pt particle production. The studies have been continuously made on the nature of high energy secondaries from 'Centauro-species' in Chacaltaya two-story chambers. Striking characteristics have been noticed on the nature of high energy secondaries from Chiron-type families. They are the existence of penetrating 'mini-clusters' of small pt(gamma) particle productions and the short collision mean free path of high energy secondaries in not only in atmosphere but also in the chamber material. The results of a systematic study on interaction mean free path of high energy secondaries from Chiron-type interactions by measuring the distribution of shower starting position in Chacaltaya two-story chambers are outlined. Yokoi (Aoyamagakuin Univ., Tokyo, Japan.), and V. V. Kopenkin (Moscow State Univ., Russia.) et al *In* Tokyo Univ., Contributions to the 23rd ICRC from emulsion Chamber Experiments at Mt. Chacaltaya and Pamirs Jun. 1993 p 13-16 (For primary document see N94-25624 07-93)
Avail: CASI HC A01/MF A01

The experimental procedures and the experimental results of the observation of characteristics of cosmic-ray hadron interactions in uniform-type thick lead chambers at Pamir are outlined. The structure of the 60 cm-thick uniform-type lead chambers used in this experiment and that of the 120 cm-thick lead chambers which the Moscow State University (MSU) group analyzed previously are presented. The chambers are composed of three units, and each of them has an area of 10 sq m. After exposure, the X-ray films were processed in Russia and then sent to Japan for analysis. Experimental results based on the exposure of 16 sq myr and the comparison with MSU results based on the exposure of 26 sq myr are described. The routine naked-eye scanning of the dark spots due to electron showers is applied on X-ray film to measure the direction

and energy of electron showers. The origin of the observed showers is either a gamma-ray or a hadron. A shower which starts deep in the chamber, or whose transition curve deviates much from that of a pure electromagnetic cascade shower, is identified as a hadron-induced shower. The basic results on cosmic-ray hadrons at the altitude of the Pamir (590 g/sq cm) are presented, and excellent mutual agreement is observed between the present results and those of the MSU group.

Avail: CASI HC A01/MF A01

This report describes the experimental results on the characteristics of atmospheric and local hadron interactions through the observation of high energy cosmic-ray hadrons in uniform-type thick lead chambers (containing 60 cm-thick lead) exposed at Pamir. The global feature of atmospheric hadron interactions through the observed cosmic-ray hadron flux were studied by comparing it with the simulation calculation results. The simulations are conducted on the models constructed on the basis of the knowledge obtained in lower energy accelerator experiments. Two of the models, both of which assume scaling type pion multiple production, are studied. Observed hadron-induced showers belong to either of the two categories, due to singly arriving hadrons and those associated with families. A 'family' is defined as a group composed of at least two parallelly arriving showers satisfying the condition in which their respective visible energies are not less than detection threshold energy. The cosmic-ray has been repeatedly studied at high mountain altitudes, Charataya and Pamir, with various types of chambers, and the flux value obtained at the Pamirs in this experiment is consistent. It is quite striking that not only high energy cosmic-ray family flux but also hadron flux is much smaller than expected value on the extrapolation of the knowledge on hadron interactions observed in the lower energy accelerator experiments. Avail: CASI HC A01/MF A01

The characteristics of the secondary 'hadrons', produced by a special type 'Chiron', one of the exotic cosmic-ray families named 'Centauro-species', were studied. They have short mean free path, which is as small as one-third to half of the nucleonic geometrical collision mean free path, and they give rise to special shower phenomena named 'mini-clusters', the shower clusters initiated by a group of particles with very small relative production p(sub t). The attenuation of high energy hadrons belonging to the families of highest energy range observed in the uniform-type thick lead chambers was studied, and the results seem to constitute one of the most promising indication for the existence of the type of exotic cosmic-ray interactions, 'Chiron'. Showers of hadronic origin which show anomalous transition behavior were noticed. Examples of the showers indicate that some peculiar fragmentation processes are going on in the forwardmost angular region of the high energy cosmic-ray hadronic collision, giving rise to the emission of small p(sub t) secondaries, which themselves, in turn, induce the showers of anomalous transition behavior. PENETRATING NATURE OF VERY COLLIMATED HIGH-ENERGY SHOWER-CLUSTERS OF HADRONS AND GAMMA RAYS

M. Tamada *In* Tokyo Univ., Contributions to the 23rd ICRC from Emulsion Chamber Experiments at Mt. Chacaltaya and Pamirs Jun. 1993 p 25-28 (For primary document see N94-25624 07-93)
Avail: CASI HC A01/MF A01

Calculation was conducted for the case of shower-clusters with non-vertical incidence, and contribution from hadronic showers was also included in the calculation. The following simulation calculations were conducted: (1) atmospheric nuclear and electromagnetic cascade using Monte Carlo algorithm as a model of nuclear interactions and assuming all secondaries are pions for simplicity; (2) three-dimensional electromagnetic shower development inside the chamber, for each constituent shower particle, using Monte Carlo method taking into account the exact structure of Pamir carbon chamber; and (3) three-dimensional electromagnetic shower development inside the chamber applying the Monte Carlo method to the electrons, photons, and hadrons inside a square area of 22 times 22 sq mm of the family center. Experiment was conducted applying raster scanning over shower-cluster region (5 times 5 sq mm, 10 times 10 sq mm, etc., depending on the size) in x ray film of the four layers by microphotometer. In the simulated gamma and hadron families, hadrons are usually spread out and very small number of hadrons are found in the central part of the families. Penetrating power seen in experimental data was large possibly due to contributions of hadronic component which have interacted inside carbon layer of 60 cm thick. Author (NASDA)

ENERGY CONCENTRATION IN HIGH ENERGY HADRON-GAMMA FAMILIES

M. Tamada *In* Tokyo Univ., Contributions to the 23rd ICRC from Emulsion Chamber Experiments at Mt. Chacaltaya and Pamirs Jun. 1993 p 29-32 (For primary document see N94-25624 07-93)
Avail: CASI HC A01/MF A01

Exotic hadron-gamma families of 'Centauro-species' were observed and how inclusion of exotic processes changes the relation between family intensity and rate of energy concentration was also studied by constructing simple toy-model for exotic processes. The relations in this model are closer to those of experimental data than in the other models of pion multiple production, but this model gives too many events with very large spread. In the present toy-model, secondary nucleons are assumed to be produced with large p(sub t), and then secondaries and tertiaries are spread out. Moreover gamma-rays are tertiary products and the energy dissipation of gamma-ray component becomes very large, and only those events which make interaction near and above the chamber can be detected. Thus low intensity of family observation together with hard spectrum of showers in the families and high rate of energy concentration indicate that the observed families are in a young stage of atmospheric nuclear cascade development. It is assumed that secondaries in Centauro and mini-Centauro interactions are nucleons and anti-nucleons, and these particles make interaction during passage process through the atmosphere.

VIOLATION OF FEYNMAN SCALING LAW IN THE FORWARD REGION

Akinori Ohsawa *In its* Contributions to the 23rd ICRC from Emulsion Chamber Experiments at Mt. Chacaltaya and Pamirs Jun. 1993 p 33-36 Sponsored by Ministry of Education, Science and Culture (For primary document see N94-25624 07-93)
Avail: CASI HC A01/MF A01

Comparison was made on three sets of data from two simulation models, and Chacaltaya experiments, which are at present the whole of the data available to discuss the Feynman scaling law in the forward region at high energy region. Comparison is made without introducing any additional assumptions except the experimental data, and hence the conclusion shows exactly what the data indicate. It is concluded that all of the data, expressed by the different physical quantities, are consistent with one another and show the violation of the law. The degree of the violation, estimated in the present analysis, is stronger than the estimation, but weaker than that by Wdowszyk and Wolfendale. The scale-breaking feature in pion multiple production and the consequent decreasing inelasticity cause detectable effects to the behavior of high energy cosmic rays in the atmosphere. It is concluded that the primary cosmic rays are not necessary to be heavy-dominant, because the violation of the law provides a rapid energy-dissipating process sufficiently. Hence the hypothesis of the heavy-dominant primary cosmic rays should be revised in light of the violation of the Feynman scaling law. Author (NASDA)

Chacaltaya and Pamirs Jun. 1993 p 37-40 Sponsored by Ministry of Education, Science and Culture (For primary document see N94-25624 07-93)

Avail: CASI HC A01/MF A01

Data of 46 families with the accompanying Air Showers (AS), observed by the combination of the Emulsion Chamber (EC) and the air shower array at Mt. Chacaltaya, are presented. The experimental setup including the AS array which consists of 40 scintillation detectors and the emulsion chamber of 32 units is outlined. Size spectrum of total AS observed and the total energy observed in the family were obtained. The AS, which accompanies the family, is looked for in the list by the following two conditions: (1) the burst size is in proportion with the total energy observed in the family; and (2) both arrival directions of the family and Electromagnetic Air Shower (EAS) are in agreement with each other within the range of errors to examine the correlation between families and AS's. Integral energy spectrum of gamma-rays per family for the different intervals of the total energy observed in the family and the size of AS. Comparison with simulation calculation results concludes that a change is necessary in the characteristics of hadron interactions in high energy region equal to or exceeding 10(exp 15) eV. STOCHASTIC SOLUTION TO QUANTUM DYNAMICS

Sarah John (Vigyan Research Associates, Inc., Hampton, VA.) and John W. Wilson Feb. 1994 38 p

(RTOP 199-45-16-11)

(NASA-TP-3408; L-17295; NAS 1.60:3408) Avail: CASI HC A03/MF A01

The quantum Liouville equation in the Wigner representation is solved numerically by using Monte Carlo methods. For incremental time steps, the propagation is implemented as a classical evolution in phase space modified by a quantum correction. The correction, which is a momentum jump function, is simulated in the quasi-classical approximation via a stochastic process. The technique, which is developed and validated in two- and three- dimensional momentum space, extends an earlier one-dimensional work. Also, by developing a new algorithm, the application to bound state motion in an anharmonic quartic potential shows better agreement with exact solutions in two-dimensional phase space. Mallozzi (Alabama Univ., Huntsville.), Tom M. Koshut (Alabama Univ., Huntsville.), Gerald J. Fishman, Charles A. Meegan, Robert B. Wilson, Alan B. Harmon, and Chryssa Kouveliotou *In* Alabama Univ., BATSE Data Analysis 15 Feb. 1994 1 p (For primary document see N94-26685 07-93)

Avail: CASI HC A01/MF A01

Distributions of the continuum spectral characteristics of 260 bursts in the first Burst and Transient Source Experiment (BATSE) catalog are presented. The data are derived from flux ratios calculated from the BATSE Large Area Detector (LAD) four channel discriminator data. The data are converted from counts to photons using a direct spectral inversion technique to remove the effects of atmospheric scattering and the energy dependence of the detector angular response. Although there are intriguing clusterings of bursts in the spectral hardness ratio distributions, no evidence for the presence of distinct burst classes based on spectral hardness ratios alone is found. All subsets of bursts selected for their spectral characteristics in this analysis exhibit spatial distributions consistent with isotropy. The spectral diversity of the burst population appears to be caused largely by the highly variable nature of the burst production mechanisms themselves. Author

Avail: CASI HC A01/MF A01

The continuum spectra of bursts are studied with particular emphasis placed on the search for spectral subcomponents. The spectra observed in individual bursts show significant evolution throughout their durations. The degree to which hard and soft spectra are combined in bursts and the effect this has on the complexity of the observed spectra are addressed. In particular the presence of broad cusps in spectra in the 50-100 keV range are studied to determine both the degree to which these features are present in the LAD data and whether superposition of hard and soft spectra simultaneously can account for them. Also the time histories of the power output (ergs/sec) from bursts are studied to investigate the dynamic coupling between hard and soft spectra in bursts as a probe of the autonomy of the hard and soft emission mechanisms. Evidence is presented for the existence of two spectral states contributing simultaneously to the total spectrum observed in many gamma-ray bursts (GRB's). An ensemble of 120 GRB's measured by BATSE were studied, using 4 channel spectral data, to determine in which bursts the spectral states can be most effectively resolved. The technique of summing the low intensity spectra together to get an average spectrum allows for precise characterization of the average low intensity spectral behavior. The 4 and

16 channel spectra obtained by the BATSE Large Area Detectors (LAD's) are analyzed using a model-independent spectral inversion technique. The results of these analyses applied to an individual burst are discussed in detail. Author (revised)

BALLOON-BORNE MEASUREMENTS OF THE SN1987A HARD X RAY CONTINUUM Abstract Only

Geoffrey N. Pendleton (Alabama Univ., Huntsville.), William S. Paciesas (Alabama Univ., Huntsville.), Gerald J. Fishman, Charles A. Meegan, and Robert B. Wilson *In* Alabama Univ., BATSE Data Analysis 15 Feb. 1994 1 p (For primary document see N94-26685 07-93)

Avail: CASI HC A01/MF A01

SN1987A hard x ray continuum spectra obtained on 29 Oct. 1987, 9-10 Apr. 1988, and 11 Nov. 1988, from balloon flight measurements are presented. The spectra, spanning the energy range from 25 keV to 300 keV, were analyzed using a detector response matrix inversion technique that converts the spectra from counts/sec-sq cm-kev to photons/sec-sq cm-kev allowing direct comparison with theoretical models. The results indicate that the bulk of the Co-56 is mixed moderately through the inner regions of the SN envelope but they do not preclude the mixing of a small amount of the Co-56 further out into the envelope necessary to account for the observed Co-56 line fluxes. The effect of the ratio of Co-57 to Co-56 on the 11 Nov. 1988, continuum spectrum is discussed. Author (revised)

CHANNEL TO ENERGY CALIBRATION RESULTS FOR THE BATSE LARGE AREA DETECTORS Abstract Only

Geoffrey N. Pendleton (Alabama Univ., Huntsville.), William S. Paciesas (Alabama Univ., Huntsville.), Michael S. Briggs (Alabama Univ., Huntsville.), B. A. Harmon, C. A. Wilson, Gerald J. Fishman, Robert B. Wilson, and Charles A. Meegan *In* Alabama Univ., BATSE Data Analysis 15 Feb. 1994 1 p (For primary document see N94-26685 07-93)

Avail: CASI HC A01/MF A01

Continuum 16 channel spectra obtained from in flight data are used to identify and correct for nonlinearities in the channel-to-energy conversion algorithm for the BATSE large area detectors. The Crab Nebula spectra obtained by the BATSE earth occultation technique are used to characterize any nonlinearities inherent in the low energy channel bin widths on a detector by detector basis. The bin widths are optimized to remove distortions from observed gamma ray spectra. The recalibrated bin edges are used in an analysis of Crab Pulsar data to verify the improvements in the calibration. Author (revised)

To obtain a better understanding of the wave-particle mechanisms responsible for the loss of electrons from the radiation belts, energetic electron data from the Burst and Transient Source Experiment (BATSE) on the NASA's Compton Gamma Ray Observatory (GRO) was studied. Powerful ground-based VLF transmitters resonantly scatter electrons from the inner radiation belt onto trajectories from which they precipitate into the atmosphere as they drift eastward. 563 instances in which the satellite traversed a cloud of energetic electrons which had been scattered into quasi-trapped trajectories were identified. From the longitude distribution, it was concluded that waves from the VLF transmitter NWC at 114 deg E are the origin of 257 of the events, and waves from UMSat 44 deg E related to 45 more. In another 177 cases the electrons had drifted from the longitude of these transmitters to a location in the western hemisphere. The previously reported seasonal variation in the frequency of occurrence of cyclotron resonance interaction is confirmed with the continuous coverage provided by GRO. The frequency of occurrence of the cyclotron resonance interactions is largest before sunrise, which we attribute to the diurnal variations in the transmission VLF waves through the ionosphere. For the first time, unique very narrow sheets of electrons occurring in the aftermath of a large geomagnetic storm are reported. Author (revised)

(DE94-001799; DOE/ER-40623/2) Avail: CASI HC A03/MF A01

Progress in the design and construction of a light meson spectroscopy experiment is reported. The experiment will run in 1993. Some non-accelerator activities and plans for the future are also discussed. Results of a Brookhaven beam test with a subset of the final detector are described. The test was quite promising both in the speed with which results were obtained and in the quality of the data itself. The status of the CsI veto is reported. The target region, in particular the CsI veto experiment is Notre Dame's primary hardware responsibility on this experiment. DOE

(NASA-CR-195246; NAS 1.26:195246) Avail: CASI HC A03/MF A01

During the report period the BUGS-4 instrument was completed, and the maiden voyage took place on 29 September from Fort Sumner, New Mexico. The successful flight of a large spherical drift chamber is a unique first for the sub-orbital balloon program. Unfortunately the instrument was consumed by fire after striking a power line during landing. However, while at float altitude, circa 24 hours of data were telemetered. The pre-flight preparations, and flight operations are described. Author (revised)

AN APRIL 1991 OUTBURST FROM 4U0115+63 OBSERVED BY BATSE
Lynn Cominsky (Sonoma State Univ., CA.), Mallory Roberts (Sonoma State Univ., CA.), and Mark H. Finger Dec. 1993 3 p
(Contract NAG5-2032; DE-AC03-76SF-00515)
(NASA-CR-195252; NAS 1.26:195252; SLAC-PUB-6406) Avail: CASI HC A01/MF A01

4U0115+63 is a recurrent transient X-ray pulsar in a moderately eccentric orbit with a Be star companion, V635 Cas. Many outbursts from this system have been reported over the past twenty years; yet despite the apparent relation between optical outbursts from the companion star and subsequent X-ray transient events, the physical mechanism for the mass transfer in the system remains unclear. In this paper, we present the preliminary results of analysis of observations made using BATSE during the 1991 April outburst from this system. This outburst does not fit the pattern of three year recurrence intervals previously suggested by Whitlock, Roussel-Dupre and Priedhorsky (1989). The orbital elements of the system have been updated and do not support the claim of Tamura et al., (1992) that apsidal motion was detected in this system based on the 1990 Ginga outburst. Author

DIRECT EVIDENCE OF THE INTERPLANETARY MAGNETIC FIELD EFFECT ON THE COSMIC-RAY SHADOW BY THE SUN
M. Amenomori, Z. Cao, L. K. Ding, Z. Y. Feng, K. Hibino, N. Hotta, Q. Huang, A. X. Huo, H. Y. Jia, and G. Z. Jiang et al Jun. 1993 19 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan and Committee of Natural Science Foundation, Beijing, China Prepared in cooperation with Tibet Asr Collaboration, Tibet, China
(ICRR-296-93-8; JTN-94-80575) Avail: CASI HC A03/MF A01

The Tibet air shower array, which has been successively operated at an altitude of 4,300 m a.s.l. since 1990, has detected the shadows of the sun and moon in the 10 TeV cosmic ray flux. In particular, the shadow of the sun was observed in the direction significantly away from the apparent solar position, under the influence of the solar and interplanetary magnetic fields. A further analysis shows that the shadows by cosmic rays are shifted in opposite directions according to the polarity of the fields. This is the first direct observation of the influence of the interplanetary magnetic field on the shadow's displacement. The results imply that observation of the cosmic ray shadow by the sun can produce new information on the relation between a time variation of the large-scale structure of the solar and interplanetary magnetic fields and the cycle of solar activity. MONTE CARLO CALCULATIONS OF LOW BACKGROUND DETECTOR RESPONSE
H. S. Miley Nov. 1993 5 p Presented at the Nuclear Science Symposium, San Francisco, CA, 2-5 Nov. 1993
(Contract DE-AC06-76RL-01830)
(DE94-004593; PNL-SA-22411; CONF-931107-27) Avail: CASI HC A01/MF A01

An implementation of the Electron Gamma Shower 4 code (EGS4) has been developed to allow convenient simulation of typical gamma ray measurement systems. Coincidence gamma rays, beta spectra, and angular correlations have been added to adequately simulate a complete nuclear decay and provide corrections to experimentally determined detector efficiencies. This code has been used to strip certain low-background spectra for the purpose of extremely low-level assay. Monte Carlo calculations of this sort can be extremely successful since low background detectors are usually free of significant contributions from poorly localized radiation sources, such as cosmic muons, secondary cosmic neutrons, and radioactive construction or shielding materials. Validation of this code has been obtained from a series of comparisons between measurements and blind calculations. The singles counting efficiency of a particular counting experiment was reproduced within the accuracy of the known dimensions of the detector components. This allowed the complete simulation of a nuclear decay including two coincident gamma rays with a non-isotropic angular correlation. In addition, text-book efficiency curves have been reproduced for several sizes of sodium iodide detectors. Examples of the use and several spectral results are presented. DOE

BATSE BURST LOCATION ACCURACY AND CONSTRAINTS ON THE FRACTION OF REPEATING GRB SOURCES
T. E. Strohmayer, E. E. Fenimore, and J. A. Miralles (Valencia Univ., Burjassot, Spain.) 1993 10 p Presented at the BATSE Gamma Ray Burst Workshop, Huntsville, AL, 21-23 Oct. 1993
(Contract W-7405-eng-36)
(DE94-004981; LA-UR-93-4279; CONF-9310252-2) Avail: CASI HC A02/MF A01

We use a one parameter model for GRB source repetition to investigate the ability of BATSE to detect source repetition and to place constraints on the fraction of repeating sources. From Monte Carlo simulations, we find that the current uncertainty in BATSE burst locations severely limits our ability to confidently detect source repetition from distributions containing fewer than 10 - 15% repeaters. A fit of our repetition model to 260 BATSE catalog bursts yields a best-fit repeating fraction of f(sub r) = 21% with a 90% confidence region ranging from 5.5 to 32.5%. By modifying the size of the measurement errors in our simulations we show that the location and width of the confidence region depends sensitively on the burst location errors. With BATSE's present location accuracy analysis of larger samples of bursts will not appreciably improve the constraint on the repeating fraction. DOE

GAMMA LARGE AREA SILICON TELESCOPE (GLAST): APPLYING SILICON STRIP DETECTOR TECHNOLOGY TO THE DETECTION OF GAMMA RAYS IN SPACE
W. B. Atwood Jun. 1993 15 p Presented at the GLAST Silicon Detector Conference, Hiroshima, Japan, 22-24 May 1993
(Contract DE-AC03-76SF-00515)
(DE94-003451; SU-SLAC-PUB-6267; CONF-9305305-1) Avail: CASI HC A03/MF A01

The recent discoveries and excitement generated by space satellite experiment EGRET (presently operating on the Compton Gamma Ray Observatory (CGRO)) have prompted an investigation into modern detector technologies for the next generation space based gamma ray telescopes. The GLAST proposal is based on silicon strip detectors as the 'technology of choice' for space application: no consumables, no gas volume, robust (versus fragile), long lived, and self triggerable. The GLAST detector basically has two components: a tracking module preceding a calorimeter. The tracking module has planes of crossed strip (x,y) 300 (mu)m pitch silicon detectors coupled to a thin radiator to measure the coordinates of converted electron-positron pairs. The gap between the layers (approximately 5 cm) provides a lever arm for track fitting resulting in an angular resolution of less than 0.1 deg at high energy. The status of this R & D effort is discussed including details on triggering the instrument, the organization of the detector electronics and readout, and work on computer simulations to model this instrument. DOE

DMSP SATELLITES AS GAMMA RAY BURST DETECTORS
J. Terrell, P. Lee, R. W. Klebesadel, and J. W. Griffee (Sandia National Labs., Albuquerque, NM.) 1993 6 p Presented at the BATSE Gamma Ray Burst Workshop, Huntsville, AL, 21-23 Oct. 1993
(Contract W-7405-eng-36)
(DE94-004977; LA-UR-93-4313; CONF-9310252-1) Avail: CASI HC A02/MF A01

Gamma-ray burst detectors are aboard three US Air Force Defense Meteorological Satellite Program (DMSP) spacecraft, in orbit at 800 km altitude, with corresponding fields of view to 117 deg from the zenith. A large number of bursts were detected by DMSP, usually confirming and supplementing data from GRO and other spacecraft. The location of a gamma-ray burst source detected by several DMSP spacecraft is considerably restricted by knowledge of the several fields of view. Often non-detection of a strong burst by one or more DMSP spacecraft is even more informative in narrowing the possible area of the burst. The DMSP data in conjunction with observations by other spacecraft can lead to reasonable positional information when more accurate positions are not available from GRO or other data. DOE

SIMULATIONS OF TERRESTRIAL IN-SITU COSMOGENIC-NUCLIDE PRODUCTION
R. C. Reedy, K. Nishiizumi (California Univ., San Diego, La Jolla.), J. R. Arnold (California Univ., San Diego, La Jolla.), and D. Lal (Scripps Institution of Oceanography, La Jolla, CA.) 1993 6 p Presented at the 6th International Conference on Accelerator Mass Spectrometry, Canberra, Australia, 17 Sep. - 1 Oct. 1993
(Contract W-7405-eng-36)
(DE94-004999; LA-UR-93-4406; CONF-930960-6) Avail: CASI HC A02/MF A01

Targets of silicon and silicon dioxide were irradiated with spallation neutrons to simulate the production of long-lived radionuclides in the surface of the earth. Gamma-ray spectroscopy was used to measure Be-7 and Na-22, and accelerator mass spectrometry was used to measure Be-10, C-14, and Al-26. The measured ratios of these nuclides are compared with calculated ratios and with ratios from other simulations and agree well with ratios inferred from terrestrial samples. DOE

GAMMA RAY BURSTS FROM THE ACCRETION OF SOLID BODIES ONTO HIGH-VELOCITY GALACTIC NEUTRON STARS
S. A. Colgate and P. J. T. Leonard 1993 6 p Presented at the BATSE Gamma Ray Burst Workshop, Huntsville, AL, 21-23 Oct. 1993
(Contract W-7405-eng-36)
(DE94-005006; LA-UR-93-4340; CONF-9310252-4) Avail: CASI HC A02/MF A01

We propose a simple model for the gamma-ray bursts based on high velocity Galactic neutron stars that have accretion disks. The latter are formed from a mixture of material from the supernova shell and that ablated from a pre-supernova binary companion. Accretion onto the neutron star from this disk when the disk is still largely gaseous may result in a soft gamma-ray repeater phase. Much later, after the neutron star has moved away from its birthplace, solid bodies form in the disk, and some are perturbed into hitting the neutron star to create gamma-ray bursts. This model makes several predictions that are consistent with the observations. The observed combination of a high degree of isotropy on the sky coupled with the observed value of (V/V(sub max)) is not, at first glance, predicted, but is not impossible to attain in our model. DOE

A SIMPLE SATELLITE SYSTEM TO LOCATE GAMMA RAY BURSTERS USING SCINTILLATING FIBER TECHNOLOGY
Alberto Colavita, F. Fratnik, and P. Colavita (Universidad Nacional de San Luis, Argentina.) Jul. 1993 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE94-601287; IC-93/218) Avail: CASI HC A03 (US Sales Only)

A study on the feasibility of using a system of small, light, long-lived and simple satellites in order to locate gamma-ray bursters is presented. Each small satellite possesses only electronics to discriminate gamma rays out of the large background of cosmic rays and to time the arrival of the front of a gamma ray burst. The arrival of a gamma ray strikes a plane made out of scintillating fibers. A layered structure of thin lead foils and scintillating fibers is used to obtain a low trigger threshold of approximately 20 MeV. To locate the burster applying triangulation methods, the system uses the time of arrival of the front of the gamma-ray burst and the position of the satellites at that very moment. The authors review an elementary version of the triangulation method to study the angular error in the determination of the burster position. They show that for almost all nonpathological distances among satellites, the angular location of the source can be determined to better than one arc min. This precision allows the visible counterpart of the burster to be found, if it exists. These simple satellites can be made modular in order to customize their sizes or weights in order to use spare space available during major launches. Also proposed is a block diagram for the satellite architecture as well as a simple and strong detector using scintillating fiber technology. DOE

THE EVOLUTION OF THE HIGH-SPEED CIVIL TRANSPORT
M. Leroy Spearman Feb. 1994 48 p Presented at the AIAA Aircraft Design, Systems and Operations Meeting, Monterey, CA, 11-13 Aug. 1993
(RTOP 505-69-20-01)
(NASA-TM-109089; NAS 1.15:109089) Avail: CASI HC A03/MF A01

Current research directed toward the technology requirements for a high-speed civil transport (HSCT) airplane is an outgrowth of many years of activity related to air transportation. The purpose was to review some of the events that provided the background upon which current research programs are built. The review will include the subsonic era of transport aircraft and some events of the supersonic era that are related to the development of commercial supersonic transport aircraft. These events include the early NASA in-house studies and industry evaluations, the U.S. Supersonic Transport (SST) Program, the follow-on NASA supersonic cruise research programs, and the issuance of the National Aeronautical Research and Development (R&D) goals. Observations are made concerning some of the factors, both technical and nontechnical, that have had an impact on HSCT studies. Author (revised)

TRIUMF SCIENTIFIC ACTIVITIES Annual Report, 1992
Apr. 1993 263 p
(CTN-94-61062) Avail: CASI HC A12/MF A03

TRIUMF was established in 1968 as a laboratory operated and to be used jointly by a consortium of British Columbia and Alberta universities. Universities from other provinces have since been added as associate members, and the facility is also open to other Canadian and foreign users. The experimental program is based on a cyclotron capable of producing three simultaneous beams of protons, two of which are individually variable in energy from 180 to 520 MeV, and the third which is fixed at 70 MeV. The potential for high beam currents qualifies this machine as a meson factory. Fields of research include medium-energy nuclear physics and chemistry, particle physics, applied research in such fields as radioisotopes and tomography, and nuclear fuel research. A biomedical research facility at TRIUMF uses mesons in cancer research and treatment. Research programs at TRIUMF are reviewed along with activities in its electronics and computing division, applied programs division, engineering division, cyclotron operations division, and in the study being conducted to define various aspects of the KAON project. Lists of publications and experiment proposals are included. CISTI

The Institute for Information Technology (IIT) is one of the engineering research and technology sector institutes of the National Research Council of Canada. The mission of IIT is to assist industry across Canada to improve competitiveness through excellence in information technology by supporting and undertaking focused, industry oriented research in software and systems and by applying information technology in partnership with other Council institutes. There are four laboratories within IIT and there are four elements to IIT's research program: software engineering, knowledge based systems, sensor based automation, and systems integration. Institute activities in the IIT laboratories are reviewed, along with IIT management and administration, financial and human resources, publications, awards, patents and licenses, presentations at conferences by IIT members, and IIT participation on committees. Highlights of research include development of the world's first commercial erbium-doped fiber laser, devising of a technique for realtime collision avoidance for robotic manipulators, a demonstration of the BIRIS three dimensional vision system, and building of a simulator to evaluate reliability of a safety critical software demonstration. Aug. 1993 86 p
(JTN-94-80608) Avail: CASI HC A05/MF A01

This bibliography lists reports published by the members of Institute for Materials Research, Tohoku University, Japan in 1992. This list contains papers on materials, properties and phenomena, instrumentation and experimental methods, and computer science. The category of materials contains ferrous and non-ferrous metals and alloys, semimetals and semiconductors, refractory materials and ceramics, superconductors and superconductivity, magnetic materials and magnetism, nuclear materials and irradiation effects, composite materials, amorphous materials and quasicrystal, and thin film, fine particles, and mesoscopic state. The properties and phenomena contains phase diagram and transformation, thermodynamical properties and diffusion, crystal growth and imperfection, impurity effect, melting and solidification, metal working and joining, high temperature and plasma state, amorphous and liquid state, crystal structure, electronic structure, electrical properties, optical properties magnetic resonance and Mossbauer effects, low temperature and quantum fluids, surface, interface and tunneling, electrochemical properties, corrosion and catalysis, and mechanical properties. The instrumentation and experimental methods includes analytical chemistry and spectroscopy, electron-, ion- and optical microscopy, diffraction and scattering of X-ray, electron, neutron and ion, high magnetic field and high pressure, purification and impurity detection, new method of material development and techniques. The computer science contains materials design by computer simulation, database system and retrieval method, and computer graphics and other applications. Author (NASDA)

This report discusses the two-stage light-gas gun which was developed by the Super-High-Altitude Research Project (SHARP) and is a step toward realizing a launcher that can deliver payloads at a fraction of the cost of rockets. The SHARP gun is different from other two-stage designs because it is larger and its launch and pump tubes are joined at right angles. This configuration allows the launch tube to point at any angle toward the sky while the pump tube remains horizontal. The authors have demonstrated that this gun can fire projectiles when the launch tube is in the horizontal position. Also included is a discussion about and remarks from Dr. Michael M. May who was the Laboratory's fifth director from 1965 to 1971. CASI

NASA created the Numerical Aerodynamic Simulation (NAS) Program in 1987 to focus resources on solving critical problems in aeroscience and related disciplines by utilizing the power of the most advanced supercomputers available. The NAS Program provides scientists with the necessary computing power to solve today's most demanding computational fluid dynamics problems and serves as a pathfinder in integrating leading-edge supercomputing technologies, thus benefitting other supercomputer centers in government and industry. The 1992-93 operational year concluded with 399 high-speed processor projects and 91 parallel projects representing NASA, the Department of Defense, other government agencies, private industry, and universities. This document provides a glimpse at some of the significant scientific results for the year. Author (revised)

RESEARCH AND DEVELOPMENT ANNUAL REPORT, 1992
Aug. 1993 219 p
(NASA-TM-104777; S-731; NAS 1.15:104777) Avail: CASI HC A10/MF A03

Issued as a companion to Johnson Space Center's Research and Technology Annual Report, which reports JSC accomplishments under NASA Research and Technology Operating Plan (RTOP) funding, this report describes 42 additional JSC projects that are funded through sources other than the RTOP. Emerging technologies in four major disciplines are summarized: space systems technology, medical and life sciences, mission operations, and computer systems. Although these projects focus on support of human spacecraft design, development, and safety, most have wide civil and commercial applications in areas such as advanced materials, superconductors, advanced semiconductors, digital imaging, high density data storage, high performance computers, optoelectronics, artificial intelligence, robotics and automation, sensors, biotechnology, medical devices and diagnosis, and human factors engineering. JSC ALMANAC
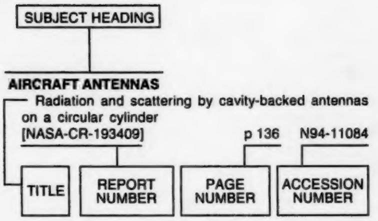
Jun. 1993 141 p
(NASA-TM-109702; NAS 1.15:109702; JSC-23314-Rev-C) Avail: CASI HC A07/MF A02

During America's space shuttle flights, press and public attention focuses on the Johnson Space Center in Houston. The press and public often put questions to JSC technical and management staff. This fourth JSC Almanac supplies answers for many such questions, and provide an informational resource for speeches to general interest groups. This Almanac is not necessarily comprehensive or definitive. It is not intended as a statement of JSC or NASA policy. However, it does provide a much needed compilation of information from diverse sources. These sources are given as references, permitting the reader to obtain additional information as required. While every effort has been made to ensure accuracy and to reconcile statistics, users requiring the most up-to-date and accurate information should contact the office supplying the information at issue. The Almanac is updated periodically as needed. The following offices were responsible for supplying material for this update. Author (revised)

SUBJECT INDEX

SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS VOLUME 32 NUMBER 7

Typical Subject Index Listing



The subject heading is a key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The page number helps you locate the citation in the abstract section. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus.*

A

ABEL FUNCTION

Matrix near rings and pseudo distributivity [DE94-601505] p 2992 N94-26366

ABILITIES

Proficiency scaling based on conditional probability functions for attributes [AD-A273816] p 3002 N94-25962

ABLATION

Ablation of solid-propellant rocket-motor nozzle materials [ESA-TT-1289] p 2699 N94-25638

Interaction between a high density-low temperature plasma and a frozen hydrogen pellet in a railgun injector [DE94-000846] p 3041 N94-25949

ABLATIVE MATERIALS

Ablation of solid-propellant rocket-motor nozzle materials [ESA-TT-1289] p 2699 N94-25638

Materials characterization on efforts for ablative materials [NASA-CR-193929] p 2756 N94-27230

ABNORMALITIES

Effects of expected-value information and display format on recognition of aircraft subsystem abnormalities [NASA-TP-3395] p 2673 N94-27882

ABORTED MISSIONS

STS-51 pad abort. OV103-engine 2033 (ME-2) fuel flowmeter sensor open circuit [NASA-CR-193924] p 2701 N94-26230

ABRASION

Unscreened low tension cables scrape abrasion testing [PB94-123767] p 2823 N94-26849

ABRASION RESISTANCE

Unscreened low tension cables scrape abrasion testing [PB94-123767] p 2823 N94-26849

ABSORPTION COOLING

Absorption technology for solar and waste heat utilization p 2854 N94-26053

ABSORPTION CROSS SECTIONS

Microwave coupling into a slotted cavity [PB94-123742] p 2772 N94-27041

Analysis of EUV/FUV dayglow and auroral measurements [NASA-CR-195237] p 2883 N94-27393

ABSORPTION SPECTRA

Characterization of semi-insulating gallium arsenide [AD-A273781] p 3068 N94-27704

Hypersensitive transition spectrum of f-element and coordination structure [DE94-604133] p 3070 N94-27843

ABSORPTION SPECTROSCOPY

Study on analyzing method establishment for metallic material development p 2729 N94-25578

High resolution fourier transform absorption spectrum of 79Br2 B3 Pi(Ou+) X1 sigma g+ [AD-A273864] p 2956 N94-25610

X ray absorption studies of Ti/polymer and Cr/polymer interfaces [DE94-003008] p 2753 N94-26770

An x ray absorption fine structure study of ordering in polythiophene thin films [AD-A274235] p 2753 N94-26822

Sound, speed, reflectivity, absorption, and thermal diffusivity measurements in Arctic ice in 1990 [AD-A274326] p 2899 N94-26886

In situ Mars ozone detector p 3108 N94-27892

ABSORPTIVITY

The effect of high frequency electric field on hypersound amplification in superlattice [DE93-634326] p 3057 N94-26384

ABUNDANCE

Reanalysis of Mariner 9 UV Spectrometer Data for Ozone, Cloud, and Dust Abundances, and Their Interaction Over Climate Timescales [NASA-CR-195244] p 3107 N94-27885

Probing the Martian atmosphere in the ultraviolet p 3108 N94-27890

How well was total ozone abundance inferred with Mariner 9? p 3108 N94-27891

Determination of lead isotope ratios in seawater by purge and trap GC/MS after ethylation p 2870 N94-28152

ACCELERATED LIFE TESTS

Failure behaviour of high density polyethylene with an embrittled surface layer due to weathering [PB94-126406] p 2840 N94-26960

Kinetic parameters from thermogravimetric analysis p 2721 N94-27909

ACCELERATION (PHYSICS)

Transient performance p 2828 N94-28045

ACCELERATION STRESSES (PHYSIOLOGY)

The electrogastrogram during parabolic flight p 2913 N94-27452

ACCELERATION TOLERANCE

The electrogastrogram during parabolic flight p 2913 N94-27452

Vertical gaze direction during parabolic flight p 2913 N94-27453

Heart rate change in normal and labyrinthectomized hamsters during parabolic flight p 2914 N94-27454

Effects of imaginary target on induced eye movements by linear acceleration p 2914 N94-27456

The Reports of Aeromedical Laboratory, volume 33, number 4 [JTN-94-80586] p 2933 N94-27942

ACCELEROMETERS

Fluid dynamic linear accelerometer [AD-D016042] p 2678 N94-27112

Modelling of the MEA float zone using accelerometer data [NASA-CR-193933] p 2761 N94-27220

ACCEPTABILITY

High-Speed Research: Sonic Boom, Volume 1 [NASA-CP-10132] p 2649 N94-28188

ACCEPTOR MATERIALS

Characterization of semi-insulating gallium arsenide [AD-A273781] p 3068 N94-27704

ACCESS CONTROL

Modeling and simulation of a fiber distributed data interface local area network [AD-A274838] p 3098 N94-26500

ACCESS TIME

A GPS coverage model p 2642 N94-27292

ACCIDENT PREVENTION

Evaluation and improvement of the inquest system on work accidents (TOT) [VTT-TIED-1418] p 2762 N94-26261

ACCIDENTS

Evaluation and improvement of the inquest system on work accidents (TOT) [VTT-TIED-1418] p 2762 N94-26261

A constitutive model for layered wire mesh and aramid cloth fabric [DE94-003275] p 2708 N94-26796

Propellants and explosives in ballistic missiles [UCRL-LR-113578] p 2760 N94-28222

ACCRETION DISKS

Studies of extra-solar Oort Clouds and the Kuiper Disk [NASA-CR-195242] p 3103 N94-26789

Gamma ray bursts from the accretion of solid bodies onto high-velocity Galactic neutron stars [DE94-005006] p 3117 N94-27827

ACCURACY

Accuracy analysis of multi-axis machines [ETN-94-95341] p 3002 N94-26000

Improved measurement accuracy in a Long Trace Profiler: Compensation for laser pointing instability [DE94-003408] p 2816 N94-26130

A simulation of GPS and differential GPS sensors p 2666 N94-27918

ACETONITRILE

Novel oxidizing reagents derived from elemental fluorine [ITN-94-85231] p 2719 N94-27687

ACOUSTIC ATTENUATION

Sound, speed, reflectivity, absorption, and thermal diffusivity measurements in Arctic ice in 1990 [AD-A274326] p 2899 N94-26886

Hydroacoustic wave-fields generated by different source types, a computational study [PB94-123536] p 3010 N94-27037

ACOUSTIC EMISSION

Characterization of acoustic effects on flame structures by beam deflection technique [DE94-003240] p 2714 N94-26122

Studies on the measurement of subsurface fractures and geostress using acoustic emission technique for deep coalbed development [REPT-7] p 2879 N94-26475

ACOUSTIC EXCITATION

Observation of impulsive acoustic events and the excitation of solar oscillations [AD-A274159] p 3111 N94-27096

ACOUSTIC FATIGUE

Methods of testing for endurance of structural elements using simulated acoustic loading [ESDU-93027] p 3011 N94-28141

ACOUSTIC PROPERTIES

Characterization of acoustic effects on flame structures by beam deflection technique [DE94-003240] p 2714 N94-26122

Sound, speed, reflectivity, absorption, and thermal diffusivity measurements in Arctic ice in 1990 [AD-A274326] p 2899 N94-26886

Problems in nonlinear acoustics: Rayleigh waves, pulsed sound beams, and waveguides [AD-A274587] p 3010 N94-26983

Hydroacoustic wave-fields generated by different source types, a computational study [PB94-123536] p 3010 N94-27037

Researches of the Electrotechnical Laboratory. No. 955: Speech recognition by description of acoustic characteristic variations [JTN-94-80604] p 2775 N94-27249

ACOUSTIC SCATTERING

New variational techniques for acoustic radiation and scattering from elastic shell structures [AD-A274599] p 3010 N94-26889

ACOUSTIC VELOCITY

Characterization of acoustic effects on flame structures by beam deflection technique [DE94-003240] p 2714 N94-26122

Iron: What is melt? [DE94-003373] p 2735 N94-26322

Sound, speed, reflectivity, absorption, and thermal diffusivity measurements in Arctic ice in 1990 [AD-A274326] p 2899 N94-26886

ACOUSTICS

Hydrodynamics, acoustics and scaling of traveling bubble cavitation [AD-A273846] p 2789 N94-25605

Characterization of acoustic effects on flame structures by beam deflection technique [DE94-003240] p 2714 N94-26122

Compressibility effects on rotor forces in the leakage path between a shrouded pump impeller and its housing p 2796 N94-27379

ACOUSTO-OPTICS

Studies of non-linear optical effects for agile beam steering [AD-A273998] p 3034 N94-25902

Acousto-optical post-processor time-integrating correlator calibration updates [DSIS-94-00053] p 2813 N94-27317

ACQUISITION

A cost model for USAF acquisition of commercial aircraft for service in the special air mission fleet [AD-A274012] p 3093 N94-25796

ACRYLATES

Dual cure low-VOC coating process [DE94-000365] p 2756 N94-27611

ACTINIDE SERIES

Debye-Waller factors of the light actinide metals [DE94-000685] p 2733 N94-26069

Radiochemistry Division annual progress report : 1991 [DE94-600652] p 2715 N94-26392

Study on laser atomic spectroscopy [DE93-633328] p 2817 N94-26402

A new materials data compilation can help in actinide phase-diagram research [DE94-000797] p 3058 N94-26514

ACTIVATED CARBON

Double layer capacitance of carbon foam electrodes [DE94-002651] p 2780 N94-25975

ACTIVATION (BIOLOGY)

Vacuum-UV-effects on E. coli plasmid pUC19: Inactivation, strand break induction and mutation induction [DLR-FB-93-26] p 2903 N94-27754

ACTIVATION ENERGY

Oriented lead zirconate titanate thin films: Characterization of film crystallization [DE94-003104] p 3053 N94-26025

Effect of temperature and recoil-energy spectra on irradiation-induced amorphization in Ca2La8(SiO4)6O2 [DE94-004371] p 3067 N94-27602

The Science Reports of the Research Institutes, Tohoku University. Series A: Physics, Chemistry, and Metallurgy. Volume 38, No. 1: Amorphous Materials 14 [JTN-94-80610] p 2744 N94-28158

Differential scanning calorimetric study of solid state amorphization and crystallization in Zr/Co and Zr/Ni multilayers p 2745 N94-28161

ACTIVE CONTROL

Module interconnection frameworks for a real-time spreadsheet [AD-A273853] p 2956 N94-25588

Status report of RMS active damping augmentation p 2684 N94-26285

A study on piezoelectric actuators and sensors for vibration control of flexible space structures [AD-A274925] p 2695 N94-26532

Operator theoretic methods in the control of distributed and nonlinear systems [AD-A274160] p 2988 N94-27139

On the use of feedback to control sound radiation from a plate excited by a turbulent boundary layer [ISVR-TR-227] p 2807 N94-28175

ACTIVITY (BIOLOGY)

Coupling of pelagic and benthic communities over a seamount in the Eastern North Pacific [AD-A274750] p 2899 N94-26149

Monitoring activity with a wrist-worn actigraph: Effects of amplifier passband and threshold variations [AD-A274705] p 2909 N94-26377

A comparison of sleep scored from electroencephalography to sleep scored by wrist actigraphy [AD-A273739] p 2910 N94-26748

Ozone control of biological activity during Earth's history, including the KT catastrophe p 2876 N94-28312

ACTIVITY CYCLES (BIOLOGY)

Chaotic dynamics of the solar cycle [AD-A274315] p 3110 N94-26883

ACTS

Remote Earth Sciences data collection using ACTS [NASA-CR-195227] p 2848 N94-26236

ACTUATORS

Performance impacts for actuator misalignments and failures in large-aperture adaptive-optic telescopes [AD-A273838] p 3034 N94-25742

Multiple model adaptive estimation applied to the LAMBDA URV for failure detection and identification [AD-A274078] p 3002 N94-25992

A study on piezoelectric actuators and sensors for vibration control of flexible space structures [AD-A274925] p 2695 N94-26532

Modelling and stability of a shape memory alloy position control system [ISBN-0-315-84467-1] p 2740 N94-27304

Experimental apparatus for optimization of flap position for a three-element airfoil model p 2682 N94-27912

ADA (PROGRAMMING LANGUAGE)

Object-oriented design and implementation of a parallel Ada simulation system [AD-A274119] p 2979 N94-25906

Real-Time Embedded Processing for Space Applications [ISBN-2-85428-335-X] p 2948 N94-26713

Real time avionics constraints: Silicon solutions p 2949 N94-26717

A complete version of the Ada tasking coprocessor p 2950 N94-26721

Standardize Ada hard real-time services? p 2951 N94-26729

Ada multiple-programming for hard real time applications in space systems p 2951 N94-26730

Scheduling approaches with Ada p 2952 N94-26734

Developing with Ada using HOOD design methodology p 2953 N94-26741

Use of HOOD coupled to real time monitors p 2953 N94-26742

Ada reusable software for satellite on-board data handling p 2953 N94-26743

CMSC-130 introductory computer science, lecture notes [AD-A274369] p 2967 N94-27060

An object-oriented database interface for Ada [AD-A274391] p 2968 N94-27075

ADAPTATION

Discovery learning in autonomous agents using genetic algorithms [AD-A274083] p 2677 N94-25998

Human dimensions research team, operation restore hope [AD-A274340] p 2939 N94-27056

ADAPTERS

New rubber qualification for the igniter adapter [NASA-CR-193936] p 2752 N94-26708

ADAPTIVE CONTROL

Adaptive optimization and control using neural networks [DE94-003941] p 2985 N94-25983

Physical modelling and adaptive predictive control of diffusion/LPCVD reactors [PB94-126398] p 2763 N94-26819

Grey-box modelling and identification topics [PB94-126380] p 2986 N94-27029

Development of a performance evaluation tool (MMSOFE) for detection of failures with Multiple Model Adaptive Estimation (MMAE) [AD-A274218] p 2665 N94-27071

Multiple model adaptive control of a large flexible space structure with purposeful dither for enhanced identifiability [AD-A274132] p 2987 N94-27122

Beamforming/null-steering adaptive array [CA-PATENT-1325260] p 2775 N94-27270

On identified predictive control p 2990 N94-27896

Modelling and control of plasma position in the STOR-M tokamak [ISBN-0-315-58891-8] p 3049 N94-27949

ADAPTIVE FILTERS

Evaluation of an Acoustic Charge Transport (ACT) device for adaptive interference suppression in spread spectrum communications systems [AD-A274073] p 2765 N94-25647

Kalman filtering of narrowband interference from direct sequence spread spectrum communications systems [ISBN-0-315-84011-0] p 2784 N94-26627

An adaptive Kalman filter for tactical missiles guidance systems [ISBN-0-315-84115-X] p 2677 N94-26636

Development of a performance evaluation tool (MMSOFE) for detection of failures with Multiple Model Adaptive Estimation (MMAE) [AD-A274218] p 2665 N94-27071

Enhanced adaptive statistical filter providing improved performance for target motion analysis noise discrimination statement of government interest [AD-D016039] p 2786 N94-27109

ADAPTIVE OPTICS

Improved quality of reconstructed images through sifting of data in statistical image reconstruction [AD-A273884] p 3034 N94-25730

Performance impacts for actuator misalignments and failures in large-aperture adaptive-optic telescopes [AD-A273838] p 3034 N94-25742

Performance comparison of shearing interferometer and Hartmann wave front sensors [AD-A274031] p 3034 N94-25768

ADDITIVES

Ion implantation of diamond: Damage, doping, and lift-off [DE94-001133] p 3054 N94-26137

Simplified high-efficiency silicon cell processing [DE94-002683] p 2857 N94-26617

ADHESION

Intelligent material systems and structures. Part 6: Measurements of adhesion between optical fibres and composite materials [PB94-123577] p 2756 N94-27215

ADHESIVE BONDING

Testing composite-to-metal tubular lap joints [DE94-003225] p 2836 N94-26032

Investigation of the bond strength of a discrete skin-stiffener interface [NLR-TP-92183-U] p 2670 N94-27796

ADHESIVES

Design of a computer expert system for adhesive selection using artificial intelligence techniques [AD-A274715] p 2751 N94-26434

Dual cure low-VOC coating process [DE94-000365] p 2756 N94-27611

ADIABATIC EQUATIONS

On the classification scheme for resonant states of muonic molecules [DE93-613645] p 3014 N94-25853

Muon transfer rates in collisions of hydrogen isotope mesic atoms on bare nuclei: Multichannel adiabatic approach [DE94-606752] p 3030 N94-27861

ADRENAL GLAND

The intracellular second messenger system in c-fos gene induction by ACTH p 2904 N94-27477

ADRENOCORTICOTROPIN (ACTH)

The intracellular second messenger system in c-fos gene induction by ACTH p 2904 N94-27477

ADSORPTION

Binding of copper and nickel to cavities in silicon formed by helium ion implantation [DE94-003769] p 3050 N94-25814

Studies of thin-film growth, adsorption, and oxidation by in situ, real-time, and ex situ ion beam analysis [DE94-002907] p 3055 N94-26275

Translational-energy-resolved studies of photogenerated carrier-induced reactions on UHV semiconductor surfaces [DE94-004169] p 3058 N94-26526

Adsorption and desorption studies of cesium on sapphire surfaces [DE94-003798] p 3070 N94-28067

ADVANCED VERY HIGH RESOLUTION RADIOMETER

The Hough transform algorithm for sea ice lead analysis: An evaluation [AD-A274535] p 2899 N94-26853

Ice surface temperature retrieval from AVHRR, ATSR, and passive microwave satellite data: Algorithm development and application [NASA-CR-195276] p 2851 N94-27849

Some practical aspects of lossless and nearly-lossless compression of AVHRR imagery p 2947 N94-28264

ADVECTION

Air pollution transport modeling [AD-A273863] p 2865 N94-25609

A positive finite-difference advection scheme applied on locally refined grids [CWI-NM-R9309] p 2867 N94-26216

A robust upwind discretization method for advection, diffusion and source terms [CWI-NM-R9308] p 2868 N94-26774

AERIAL RECONNAISSANCE

An analysis of multiple sensor system payloads for unmanned aerial vehicles [AD-A274905] p 2667 N94-26182

An evaluation of an airborne remote sensing system used to determine ice thickness and geometry of a first year sea ice ridge located in the Beaufort Sea [ISBN-0-315-84383-7] p 2849 N94-26667

Laboratory of Space Technology [PB94-133204] p 2689 N94-28358

AEROACOUSTICS
Methods in unsteady aerodynamics
[DLR-FB-93-21] p 2648 N94-27741
Coupled 2-dimensional cascade theory for noise an d unsteady aerodynamics of blade row interaction in turbofans. Volume 2: Documentation for computer code CUP2D
[NASA-CR-4506-VOL-2] p 2675 N94-27778
On the aging of sonic booms p 2650 N94-28194
AEROBRAKING
Mars transportation system p 2833 N94-25689
Minimum accommodation for aerobrake assembly, phase 2
[NASA-TM-107608] p 2692 N94-27774
AEROCAPTURE
Nonequilibrium radiation and chemistry models for aerocapture vehicle flowfields
[NASA-CR-195706] p 2648 N94-28071
AERODYNAMIC CHARACTERISTICS
Tesseract supersonic business transport
p 2671 N94-25713
The design of four hypersonic reconnaissance aircraft
p 2671 N94-25716
Design of a flight controller for an unmanned research vehicle with control surface failures using quantitative feedback theory
[AD-A274049] p 2677 N94-25833
Low-speed pressure distribution measurements over the aft-fuselage, fins, and stabilators of a 1/9th scale F/A-18 wind-tunnel model
[AD-A274870] p 2644 N94-26342
Experimental and theoretical study of aerodynamic characteristics of some lifting bodies at angles of attack from -10 degrees to 53 degrees at Mach numbers from 2.30 to 4.62
[NASA-TM-4528] p 2646 N94-26693
Effects, limits, and limitations of spanwise blowing
p 2659 N94-28027
Recent developments in the simulation of steady and transient transverse jet interactions for missile, rotorcraft, and propulsive applications p 2804 N94-28030
A review of recent aeroelastic analysis methods for propulsion at NASA Lewis Research Center
[NASA-TP-3406] p 2846 N94-28227
AERODYNAMIC COEFFICIENTS
Surface roughness lengths
[AD-A274550] p 2895 N94-26846
Numerical simulation of a powered-lift landing
p 2671 N94-28033
An initial investigation into methods of computing transonic aerodynamic sensitivity coefficients
[NASA-CR-195705] p 2648 N94-28072
Program for calculation of maximum lift coefficient of plain aerofoils and wings at subsonic speeds
[ESDU-93015] p 2649 N94-28076
Application of the influence function method using the interference distributed loads code to prediction of store aerodynamic load during separation from the CF-18 fighter aircraft p 2654 N94-28330
AERODYNAMIC CONFIGURATIONS
Control jets in interaction with hypersonic rarefied flow
p 2698 N94-28020
AERODYNAMIC DRAG
Experimental investigation of advanced hub and pylon fairing configurations to reduce helicopter drag
[NASA-TM-4540] p 2668 N94-26604
An investigation into the aerodynamic effects of wing patches
[ISBN-0-315-84121-4] p 2646 N94-26672
Surface roughness lengths
[AD-A274550] p 2895 N94-26846
Examples of flight path optimisation using a multivariate gradient-search method
[ESDU-93021] p 2670 N94-28092
Drag prediction by wake integrals using 3-D multi-grid Euler method (MGAERO) p 2655 N94-28335
Preliminary assessment of aerodynamic effects of wing repair patches p 2657 N94-28346
Evaluation of the buoyancy drag on automobile models in low speed wind tunnels p 2658 N94-28352
AERODYNAMIC FORCES
A finite wake theory for two-dimensional rotary wing unsteady aerodynamics
[AD-A274921] p 2645 N94-26535
Multidisciplinary aeroelastic analysis of a generic hypersonic vehicle
[NASA-TM-4544] p 2691 N94-27868
Experiments on interaction force of jets in hypervelocity cross-flow in a shock tunnel p 2659 N94-28022
AERODYNAMIC HEAT TRANSFER
Program to develop a performance and heat load prediction system for multistage turbines
[NASA-CR-195223] p 2674 N94-26588
AERODYNAMIC HEATING
Aerodynamic heating in hypersonic flows
p 2658 N94-27919
AERODYNAMIC INTERFERENCE
Vectored jets-induced interference on aircraft, prediction and verification p 2801 N94-28012
